In this vein one of the most famous epitaphs is that of Dr Arbuthnot on the infamous Col. Chartres:—"Here continueth to rot the body of Francis Chartres, who, with an inflexible constancy and inimitable uniformity of life, persisted, in spite of age and infirmities, in the practice of every human vice excepting prodigality and hypocrisy; his insatiable avarice exempted him from the first, his matchless impudence from the second. Nor was he more singular in the undeviating pravity of his manners than successful in accumulating wealth. For without trade or profession, without trust of public money, and without bribe-worthy service, he acquired, or more properly created, a ministerial estate. He was the only person of his time who could cheat without the mask of honesty, retain his primeval meanness when possessed of ten thousand a-year; and having daily deserved the gibbet for what he did, was at last condemned to it for what he could not do. Oh! indignant reader, think not his life useless to mankind. Providence connived at his execrable designs, to give to after-ages a conspicuous proof and example of how small estimation is exorbitant wealth in the sight of God, by his bestowing it on the most unworthy of all mortals."

EPITHALAMIUM (ἐπι, and θάλαμος *a bed-chamber*), in *Antiquity*, a nuptial song or poem in praise of the bride and bridegroom, and praying for their prosperity.

Among the Jews epithalamia were sung at the door of the bride, by her female companions, the evening before the marriage. The Greek epithalamium was performed by a chorus of boys and girls when the bride and bridegroom entered the bridal chamber; and the wedded pair were saluted the next morning with the same song slightly altered. The practice amongst the Romans was similar; the chorus, however, consisting of girls only, who sang at the door of the nuptial-chamber till midnight; but their epithalamia were frequently obscene.

EPOCH, or EPOCHA (from ἐπέχειν *to check*), in *Chronology*, a fixed point of time from which succeeding years are numbered.

EPODE, in *Lyric Poetry*, the third and concluding part of the ode; that which follows the strophe and antistrophe; the ancient ode being divided into strophe, antistrophe, and epode. The word is now used as the name of any little verses that succeed one or more great ones. Thus a pentameter after an hexameter is an epode. The term as applied to a book of Horace's poems, signifies merely additional or supplementary.

EPPING, a market-town of the county of Essex, in the hundred of Waltham, 17 miles N.N.E. from London. It is situated in a district formerly very woody, and preserved by our ancient monarchs for the enjoyment of field sports. It was then called Waltham Forest, and extended almost to the capital. In the same neighbourhood also was Hainault Forest, where a fair was held for many centuries under a remarkable tree, well known by the name of Fairlop Oak, which existed till recently, and was of prodigious size. This town is singularly irregular in its appearance; one part of it, called Epping Upland, where the church stands, being nearly a mile and a half distant from the other part, named Epping Street, which is the largest portion, and where the market is held. It has long been famed for its sausages and pork, and especially for its butter. Pop. of parish (1851) 2255.

EPROUVETTE, the name given to various machines for ascertaining the comparative strength of different kinds of gunpowder. One of the simplest and best of these consists of a small gun fixed in a frame, which is suspended as a pendulum from a horizontal bar. When the gun is fired, the recoil causes the frame to oscillate, and the extremity of the arc of vibration (which is marked by a sliding index) denotes the comparative force of the explosion.

EPSOM, a market-town in the county of Surrey, 14 miles S.W. of London. Pop. (1851) 3390. The principal building is the parish church, a Gothic edifice rebuilt in 1825. The once celebrated mineral springs discovered in 1618, and from which Epsom salts were first extracted, are now neglected. The Epsom races are held in the vicinity, and attract an immense concourse of people. The grand stand, erected in 1829–30, can contain 7500 persons.

EPULONES, in *Roman Antiquity*, certain priests, originally three in number, who were first created A.U. 558, by the pontifices, to superintend the *epulæ* or feasts in the sacred games and festivals. Their number was at length augmented from three to seven, and by Julius Cæsar was increased to ten; but after his time their number was again reduced to seven. Like the pontifices and the augures, the epulones formed a collegium at Rome.

EQUATIONS.

1. In all the applications of algebra, it is not the magnitudes concerned that we immediately consider, but merely their proportions. In every class of quantities of the same kind, one being adopted as the unit of comparison, all the rest are referred to this standard, and are represented by the proportions they bear to it. The letters of the alphabet, or other symbols, used in algebra, are not, therefore, properly speaking, the representatives of magnitudes; they denote ratios, or abstract numbers, viewed, as in the fifth book of Euclid, in the most general manner, and independently of any particular system of arithmetic or numeration.

The ancient geometry follows a different procedure. In that science the attention is in every case confined to the magnitudes under actual consideration. A general property of triangles is established, by showing that it is true of any particular triangle that comes under the proposed hypothesis. The geometer contemplates particular instances, presenting for the most part relations not very complex, and easily kept in view. On this account he carries on his investigations with the greatest clearness, and is in no danger of falling into contradiction or paradox. But his science is little susceptible of general methods. If any process within the compass of the ancient geometry be entitled to that appellation, it is what is called the method of exhaustion. Every geometer perceives that all the demonstrations under this head have the closest analogy. Yet, after a hundred applications, it is still necessary, in any new case, to pursue the reasoning through all its details, without deriving assistance from any general conclusion previously obtained.

Algebra possesses a great advantage over geometry in generalizing its processes. Problems relating to magnitudes of the most different kinds, nevertheless, lead to similar expressions in numbers. Questions in geometry, in mechanics, or concerning mercantile business, are made to depend on the same rules for their solution. It may be said that algebra and the modern analysis accomplish, for all the mathematical sciences, the project, entertained by some ingenious men, of an universal and philosophical language, which, being founded on an exact scrutiny into the nature of things, and on what they possess in common, might greatly facilitate the acquisition and the extension of our knowledge.

The spirit of generalization peculiar to algebra is nowhere more conspicuous than in the doctrine of equations. Every determinate problem that can occupy the attention of the mathematician, is ultimately reduced to the finding of such numbers as are necessary to determine the unknown quantity or quantities, by means of the equations that subsist between those numbers, and others which are given in the question. A wide field of mathematical investigation is thus brought under a limited number of algebraic expressions.

In treating of equations, it will not be necessary to begin with laying down a formal definition. We confine ourselves, in this article, to the consideration of such equations as contain only one unknown quantity. We further suppose that the elementary operations preparatory to solution are already performed; so that the unknown quantity is clear of radical signs, and is nowhere found in the denominator of a fraction; likewise that all the separate terms are brought to one side of the sign of equality, and arranged in such a manner that the first term, which must always be positive, and have unit for its index, contains the highest power of the unknown quantity, or x; the second term contains the next highest power, and so on, the term which does not contain x being placed last. This arrangement must always be understood when any term is distinguished by the order it stands in; but it will sometimes be convenient to write the terms in an inverted order, arranging them according to the indices of the unknown quantity.

Equations.

Equations are divided into different classes or orders, according to the highest power of the unknown quantity found in their terms.

An equation of the first degree, or a simple equation, is one which contains x only, without any of its powers, as $x - \mathrm{A} = 0$.

A quadratic equation, or one of the second degree, contains the square of x, as $x^2 - \mathrm{A} = 0$, or $x^2 - \mathrm{A}x + \mathrm{B} = 0$.

A cubic equation, or one of the third degree, contains the cube, or third power of x, as $x^3 - \mathrm{A} = 0$, or $x^3 - \mathrm{A}x^2 + \mathrm{B}x - \mathrm{C} = 0$.

A biquadratic equation, or one of the fourth degree, contains the fourth power, or biquadrate of x, as $x^4 - \mathrm{A} = 0$, or $x^4 - \mathrm{A}x^3 + \mathrm{B}x^2 - \mathrm{C}x + \mathrm{D} = 0$.

And, in general, an equation of the n^{th} degree contains the n^{th} power of x, and the powers inferior to the n^{th}, such as

$$x^n - \mathrm{A}x^{n-1} + \mathrm{B}x^{n-2} \ldots\ldots\ldots\ldots\ldots - \mathrm{M}x + \mathrm{N} = 0.$$

A root of an equation is a value of the unknown number x. Thus, if a represent a number, and if its powers, a, a^2, a^3, when they are substituted in the equation for x, x^2, x^3, &c. produce an equality between the positive and negative terms, then a is a root of the equation, and it is a positive root; but if, for x, x^2, x^3, &c. we must substitute $-a$, a^2, $-a^3$, &c. which are the powers of $-a$, in order to obtain the like equality, then a is a negative root of the equation.

What we have here called roots are more generally named *real roots*, to distinguish them from those expressions to which the appellation of *imaginary or impossible roots* has been given. As it will conduce to perspicuity, we shall always use the word root in the sense here defined, unless when imaginary or impossible roots are expressly mentioned.

From the definitions laid down, it follows that the negative roots of the equation,

$$0 = \mathrm{N} + \mathrm{M}x + \mathrm{L}x^2 + \mathrm{K}x^3 +, \&c.$$

are the same with the positive roots of the equation,

$$0 = \mathrm{N} - \mathrm{M}x + \mathrm{L}x^2 - \mathrm{K}x^3 +, \&c.$$

in which the signs only of all the terms containing the odd powers of x are changed. For the same result is obtained, whether we make x equal to $-a$ in the first equation, or to $+a$ in the second.

2. A great advantage has resulted from the practice introduced by Harriot, of writing all the terms of an equation on one side of the sign of equality. The polynomes formed by all the terms thus brought together are rational and integral functions of the unknown quantity; and the question is, to find in what circumstances such expressions are equal to zero. The most likely way of succeeding in this research, is to resolve the functions into their most simple component factors. Harriot supposed that every rational function can be produced by the continued multiplication of binomial factors, and in

this he has been followed by succeeding algebraists. The modern theory of equations is entirely founded on this supposition, which, although it has not been demonstrated, has yet, in some measure, been verified in the progress of the science, and by the admission of those artificial expressions called imaginary or impossible quantities. But there is a distinction between the real and impossible binomial factors of a rational polynome; for the first are expressions complete and significant by themselves, without reference to other quantities; whereas one impossible factor necessarily supposes the existence of another, the two related expressions being such that their multiplication produces one real factor of the second degree. Thus, every pair of impossible factors is equivalent to a real quadratic factor; and, by an unavoidable consequence of the forced supposition made by Harriot, the attention of algebraists has been drawn to the two impossible expressions, instead of the real one which they compose. In order to place the doctrine of equations and the theory of impossible roots on a solid foundation, it appears necessary to attempt the resolution of rational functions into their component factors by a rigorous analysis, free from arbitrary suppositions.

To resolve the rational function $f(x)$ into its component factors, we must begin with inquiring whether it can be divided without a remainder, by a division such as $x-a$, or $x+a$. If it can, the proposed function will be equal to $(x\mp a)\times f'(x)$, where $f'(x)$, the quotient of the division, is a function similar to $f(x)$, but of an order one degree lower. In like manner, it may be possible to reduce $f'(x)$ to a degree still lower, by means of one or more divisors of the same form; and, in certain cases, the first function may be entirely exhausted by successive binomial divisors. When this happens, the divisors $x-a$, $x-b$, $x-c$, &c. will be equal in number to the exponent of the highest power of x, and their continued product will be equal to $f(x)$. It is evident, that by multiplying together a proper number of such factors, an algebraic expression may be formed similar to any rational and integral function, and the co-efficients of this product will likewise contain as many quantities to be determined at pleasure as there are co-efficients in the given function. But we should reason badly if, from this process of composition, we should infer that a product arising from the multiplication of a certain number of simple factors may have any given co-efficients, or will coincide with any proposed polynome of the same degree. This is a point that can be ascertained only by a process of analysis or resolution, and by seeking all the binomial divisors any given function admits of. In fact, the cases are extremely rare in which an algebraic function can be completely exhausted by real binomial divisors. There are many polynomes which have not a single divisor of this kind; and, in the progress of resolution, we generally arrive at a function which cannot be further divided. When this is the case, it must be tried whether a quadratic divisor, as x^2+mx+n, will not be successful in lowering the function. But here it must be observed that such divisors are of two kinds; one, as $(x-\varrho)^2-r^2$, which can be resolved into two binomial factors; and one, as $(x-\varrho)^2+r^2$, which cannot be so resolved without introducing imaginary or impossible expressions. Now, to divide by a divisor of the first kind is the same thing as to divide by the two binomial factors of which it is composed; and, therefore, it is the second kind of quadratic factors only that need be tried, or that can succeed, in lowering a function already deprived of all its simple divisors. After quadratic divisors, those of the third degree would naturally come to be considered; but this is unnecessary, because algebraists have found that every rational function may be completely exhausted by simple and quadratic factors.

What has now been said naturally distributes the subject under two heads; one treating of the simple or binomial factors, and the other of the quadratic or trinomial factors, of algebraic equations.

Binomial Factors.

3. The first object of inquiry must be to find the conditions necessary, in order that a binomial quantity, as $x-a$, or $x+a$, shall divide a rational polynome without a remainder. Suppose that $x-a$ is a divisor of the polynome,

$$x^n+Ax^{n-1}+Bx^{n-2}\ldots\ldots\ldots+Mx+N,$$

which we shall denote by $f(x)$: then we shall have

$$f(x)=N+Mx+Lx^2+Kx^3+,\ \&c.$$
$$f(a)=N+Ma+La^2+Ka^3+,\ \&c.$$

wherefore, by subtracting and dividing by $x-a$, we get

$$\frac{f(x)}{x-a}-\frac{f(a)}{x-a}=M\frac{x-a}{x-a}+L\frac{x^2-a^2}{x-a}+K\frac{x^3-a^3}{x-a}+,\ \&c.$$

Now, it is known that the difference between any like powers of two numbers is exactly divisible by the difference of those numbers: hence all the quantities on the right-hand side of the sign of equality form an integral expression. But as $f(a)$ does not contain x, it cannot be divisible by $x-a$; it follows, therefore, that $f(x)$ cannot be divisible by $x-a$, unless $f(a)=0$; and it is obvious that this condition is the only one necessary. Thus, the polynome $f(x)$ will be divisible by $x-a$ when a is a positive root of the equation $f(x)=0$, otherwise not.

Again, let the divisor be $x+a$; then,

$$f(x)=N+Mx+Lx^2+Kx^3+,\ \&c.$$
$$f(-a)=N-Ma+La^2-Ka^3+,\ \&c.$$

and by proceeding as before,

$$\frac{f(x)}{x+a}-\frac{f(-a)}{x+a}=M\cdot\frac{x+a}{x+a}+L\frac{x^2-a^2}{x+a}+K\cdot\frac{x^3+a^3}{x+a}+,\&c.$$

Here again all the divisions on the right-hand side of the sign of equality can be exactly performed; and we must, therefore, conclude that $f(x)$ will be divisible by $x+a$ only when $f(-a)=0$, that is, when a is a negative root of the equation $f(x)=0$.

Now $x\mp a$ being a divisor of $f(x)$, the quotient, which we may denote by $f'(x)$, will be a polynome of $(n-1)$ dimensions, or one degree lower than $f(x)$; and we shall have

$$f(x)=(x\mp a)\times f'(x).$$

From this equation it appears that every value of x that makes $f'(x)$ equal to zero, will likewise make $f(x)$ equal to zero; consequently every binomial divisor of the first function will likewise be a divisor of the second. And if $f'(x)$ has no roots, and no binomial divisors, neither will $f(x)$ have any roots except $\pm a$, nor any binomial divisors except $x\mp a$. Suppose that the polynomes $f(x)$ and $f'(x)$ have the common root $\pm b$; they will likewise have the common divisor $x\mp b$; and if we put $f''(x)$ for the quotient arising from the division of $f'(x)$ by $x\mp b$, so that $f'(x)=(x\mp b)\,.f''(x)$, we shall have

$$f(x)=(x\mp a)\,.\,(x\mp b)\,.f''(x),$$

in which equation $f''(x)$ is a polynome of $n-2$ dimensions, or two degrees lower than $f(x)$.

It is evident we may continue to reason in the same manner either till, after successive divisions, we come at last to a binomial quotient, in which case the original polynome $f(x)$ will be completely resolved into binomial factors; or till we come to a quotient that has no roots,

in which case $f(x)$ will have no binomial factors except those previously found. We may therefore conclude that "a rational polynome has as many binomial factors as it has roots, and no more; every positive root producing a factor of the form $x-a$, and every negative root one of the form $x+a$; and since the number of binomial factors can never be greater than the dimensions of the polynome, its roots cannot exceed the same number."

4. There are very few cases in which it can be known immediately and by inspection that an equation has one or more roots. These cases depend upon the following propositions, viz. "If $\varphi(x)$ denote a rational polynome, having x, or some integral power of x, in every one of its terms, and likewise having the term that contains the greatest power of x positive, a value of x may be found that will make $\varphi(x)$ equal to any positive quantity, as s."

Suppose, first, that all the terms of $\varphi(x)$ are positive; then x^n being the first term, or that in which x rises to the highest power, if $s=t^n$, and $\lambda>t$, it is manifest that

$$\varphi(\lambda)>t^n>s.$$

Therefore, while x increases from 0 to be equal to λ, the function $\varphi(x)$ increases from 0 to be greater than s; and as the variations of $\varphi(x)$, however irregular they may be, are connected by the law of continuity, the function will pass through every gradation of magnitude between 0 and the greatest limit $\varphi(\lambda)$. Consequently, there is a value of x between 0 and λ, that will make $\varphi(x)$ equal to s.

When the terms of $\varphi(x)$ are not all positive, let all the positive terms except x^n be rejected, and all the negative terms be retained, and we shall have $\varphi(x)$ equal to, or greater than,

$$x^n-Fx^{n-i-1}-Hx^{n-i'-1}-, \text{ \&c.}$$

But, s being equal to t^n, we have

$$t^n=x^n-(x-t).\left\{x^{n-1}+tx^{n-2}+t^2x^{n-3}\ldots+t^{n-1}\right\}$$

Now, by equating the negative terms of the first expression to the terms containing the like powers of x in the value of t^n, we shall get

$$(x-t).t^i=F,\quad (x-t).t^{i'}=H, \text{ \&c.}$$

And hence,

$$x=t+\frac{F}{t^i},\quad x=t+\frac{H}{t^{i'}}, \text{ \&c.}$$

Let λ be either equal to or exceed the greatest of those values of x, then we shall have

$$\varphi(\lambda)>t^n>s.$$

Wherefore, as before, there is a value of x between 0 and λ, that will make $\varphi(x)$ equal to s.

From what has now been proved, we derive the following properties of equations.

1. "Every equation of odd dimensions has at least one positive root when the last term is negative, and one negative root when the last term is positive."

If the last term be negative, as in this instance,

$$x^{2n+1}+Ax^{2n}+Bx^{2n-1}\ldots+Mx-N=0;$$

according to what has been proved, a value of x, viz. a, may be found that will satisfy the condition,

$$a^{2n+1}+Aa^{2n}+Ba^{2n-1}\ldots+Ma=N;$$

then a is a positive root of the equation.

When the last term is positive, as in this equation,

$$x^{2n+1}+Ax^{2n}+Bx^{2n-1}\ldots+Mx+N=0,$$

change the sign of the last term, and the signs of all the terms that contain the even powers of x, then the polynome will become

$$x^{2n+1}-Ax^{2n}+Bx^{2n-1}\ldots+Mx-N:$$

and a value of x, viz. a, may be found such that

$$a^{2n+1}-Aa^{2n}+Ba^{2n-1}\ldots+Ma=N.$$

Now transpose N, and then change the signs of all the terms, and we shall get

$$-a^{2n+1}+Aa^{2n}-Ba^{2n-1}\ldots-Ma+N=0,$$

which shows that a is a negative root of the equation.

2. "Every equation of even dimensions having its last term negative, has two roots, one positive and one negative."

Let the equation be

$$x^{2n}+Ax^{2n-1}+Bx^{2n-2}\ldots+Mx-N=0;$$

and consider the polynomes,

$$x^{2n}+Ax^{2n-1}+Bx^{2n-2}\ldots+Mx-N,$$
$$x^{2n}-Ax^{2n-1}+Bx^{2n-2}\ldots-Mx-N,$$

in the latter of which the signs of all the terms containing the odd powers of x are changed; then there are two values of x, viz. a and b, such as to answer the conditions,

$$a^{2n}+Aa^{2n-1}\ldots+Ma=N$$
$$b^{2n}-Ab^{2n-1}\ldots-Mb=N:$$

consequently a is a positive and b a negative root of the equation.

3. "A polynome of even dimensions, which has no binomial factors, is always positive, whatever value be substituted for the unknown quantity."

Let the polynome be $f(x)$ or

$$x^{2n}+Ax^{2n-1}\ldots Mx+N;$$

then the last term, or that term which does not contain x, must be positive; for otherwise the polynome would have two roots and two binomial factors, contrary to the hypothesis. Now, if it be possible, let the polynome have a negative value when λ is substituted for x, so that $f(\lambda)=-P$; therefore, when $x=0$, $f(x)$ is equal to the positive quantity N; and, when $x=\lambda$, the same function is equal to $-P$; but since $f(x)$ passes through all degrees of magnitude between N and $-P$, while x varies from 0 to λ, it will become equal to zero when x has some intermediate value; therefore the polynome has one root between 0 and λ, and one binomial divisor corresponding to that root, contrary to the hypothesis.

It may be observed, that the converse of this proposition is not true; for a polynome of even dimensions, that has such factors as $(x-a)^2$, $(x-a)^4$, $(x-a)^{2m}$, may never become negative, although it is capable of being equal to zero.

5. The properties demonstrated in the last section lead to this general proposition relating to the number of roots in any equation, viz. "In any equation the number of all the roots is even when the dimensions are even, and odd when the dimensions are odd."

For every equation has as many binomial divisors as it has roots; and if we suppose an odd number of roots in an equation of even dimensions, or an even number in one of odd dimensions, the last quotient, after dividing successively by all the divisors, would be a polynome of odd dimensions, having at least one root, which would likewise be a root of the proposed equation. Therefore the number of all the roots of an equation cannot be even when the dimensions are odd, nor odd when the dimensions are even.

And again, since every polynome is equal to the continued product of all its binomial divisors, and the quotient last found, after dividing by them all successively, we obtain the following proposition, viz.: "Every rational polynome is equal either to the continued product of as many binomial factors as it has dimensions; or to the con-

tinued product of an even or odd number of such factors, according as the dimensions of the polynome are even or odd, and a polynome of even dimensions, which, having no binomial factors, is always positive, whatever value be substituted for the unknown quantity."

Equal roots.

6. When several of the binomial factors of an equation are equal to one another, it is said to have so many equal roots. In this case the equation can be divided a number of times successively by the same binomial divisor. Thus, an equation which is twice divisible by $x-a$, or, which is the same thing, once by $(x-a)^2$, has two roots equal to a; and if it can be divided by $(x-a)^m$, it has m roots equal to a.

The most obvious way of finding the conditions on which the equality of the roots depends would therefore be to expand the divisor $(x-a)^m$ by the binomial theorem, and then divide the equation by it; for, after the integral quotient is obtained, the required conditions will be found by making the several parts of the remainder separately equal to zero. The number of the conditions found in this manner is equal to the exponent of the divisor; for of so many parts will the remainder of the division consist. But, in a complex operation, it is difficult to ascertain the remainder; and, besides, it is not necessary to consider all the equations obtained by this process, because both the number and the value of the equal roots can be found by means of two of them only.

The inconveniences just mentioned will be avoided by proceeding in the following manner: Let the equation be

$$x^n + Ax^{n-1} + Bx^{n-2} \ldots + Mx + N = 0;$$

then, if it be divisible by $(x-a)^m$, the quotient will be a polynome of $n-m$ dimensions; and we may therefore suppose that the expression

$$x^n + Ax^{n-1} + Bx^{n-2} \ldots + Mx + N$$

is equal to the product,

$$(x-a)^m \times \{x^{n-m} + A'x^{n-m-1} + B'x^{n-m-2} +, \&c.\}.$$

In these expressions, x may have any value whatever; and therefore the equality between them will still subsist if we substitute $x+i$ for x, i being any arbitrary number; therefore the expression

$$(x+i)^n + A(x+i)^{n-1} + B(x+i)^{n-2} \ldots + M(x+i) + N$$

will be equal to the product

$$(x-a+i)^m \times \{(x+i)^{n-m} + A'(x+i)^{n-m-1} +, \&c.\}.$$

Now, let the several powers of $(x+i)$ be expanded by the binomial theorem, and put

$$X = x^n + Ax^{n-1} + Bx^{n-2} \ldots + Mx + N,$$

$$Y = nx^{n-1} + (n-1)Ax^{n-2} + (n-2)Bx^{n-3} \ldots + M,$$

$$Z = n\frac{n-1}{2}x^{n-2} + (n-1)\frac{n-2}{2}Ax^{n-3} +, \&c.$$

$$V = n\frac{n-1}{2}\cdot\frac{n-2}{3}x^{n-3} + (n-1)\cdot\frac{n-2}{2}\cdot\frac{n-2}{3}Ax^{n-4} +, \&c. \quad \&c. \quad \&c.$$

then the given polynome of n dimensions will become

$$X + Yi + Zi^2 + Vi^3 +, \&c. \qquad (A).$$

And if the like operations are performed in the polynome of $n-m$ dimensions, and $(x-a+i)^m$ be expanded by the binomial theorem, the product of these two expressions will become

$$\left\{(x-a)^m + m.(x-a)^{m-1}i + m.\frac{m-1}{2}.(x-a)^{m-2}i^2 +, \&c.\right\} \times \left\{X' + Y'i + Zi^2 +, \&c.\right\}. \qquad (B).$$

The expression (A) being equal to the product (B), whatever i stands for, the co-efficients of the like powers of i must be equal; and hence, by equating the terms in which i is wanting, and likewise the terms that contain the first power of i, we get

$$X = (x-a)^m X'$$

$$Y = (x-a)^m Y' + m(x-a)^{m-1}X';$$

which proves that $(x-a)^{m-1}$ is a common divisor of X and Y. If, therefore, by means of the usual process, we seek the greatest common measure of the two polynomes X, Y, or,

$$x^n + Ax^{n-1} + Bx^{n-2} \ldots\ldots + Mx + N,$$

$$nx^{n-1} + (n-1)Ax^{n-2} + (n-2)Bx^{n-3} \ldots + M;$$

we shall obtain the factor $(x-a)^{m-1}$, and the given polynome X will be divisible by $(x-a)^m$; that is, it will contain the common factor $x-a$ once more than the polynome Y contains it.

If we proceed farther, and equate the co-efficients of i^2 in the expressions (A) and (B), we shall get

$$Z = (x-a)^m Z' + m(x-a)^{m-1}Y' + m.\frac{m-1}{2}(x-a)^{m-2}X';$$

which shows that Z is divisible by $(x-a)^{m-2}$. In the same manner, it may be proved, that V is divisible by $(x-a)^{m-3}$, and so on. It appears, therefore, that the first m co-efficients of the expression (A) are respectively divisible by $(x-a)^m$, $(x-a)^{m-1}$, $(x-a)^{m-2}$, &c.; and consequently we shall have

$$X = 0,\ Y = 0,\ Z = 0,\ V = 0, \&c.$$

when the common root a is substituted for x.

If the polynome X is divisible by $\{(x-a)^2 + \beta^2\}^n$, it may be proved in like manner that $\{(x-a)^2 + \beta^2\}^{n-1}$ will be a common divisor of X and Y.

We may therefore lay down the following rule for finding all the double, triple, &c. divisors of any given polynome X: "Find R, the greatest common measure of X and Y, and resolve it into its elementary factors; then each of these factors will be contained in X once more than in R."

Number of positive and negative roots.

7. If it be required to find how many of the roots of an equation are positive, and how many are negative, we have for this purpose the rule first published in the *Geometry* of Descartes. This celebrated rule seems to have been discovered by induction; at least its author gave no demonstration of it, and disputes arose about its true import. It was demonstrated for the first time by Du Gua, in the *Mémoires de Paris;* but many other demonstrations of it have since appeared, of which that of Segner, in the *Mémoires de Berlin*, 1756, is not only the most simple, but probably the most simple that will ever be invented.

Segner deduced the rule of Descartes from the following analytical proposition, viz.

"If any rational polynome be multiplied by $x-a$, the changes from one sign to another, from $+$ to -1, and from $-$ to $+1$, will be at least one more in the product than in the given polynome; and if it be multiplied by $x+a$, the successions of the same sign, of $+$ to $+1$, and of $-$ to -1, will be at least one more."

Let the proposed polynome be

$$x^n \pm Ax^{n-1} \pm Bx^{n-1} \ldots\ldots \pm Mx \pm N;$$

then, according to the usual process, the product of the polynome by $x-a$ will be found by adding these two lines, viz.

$$\left.\begin{array}{l} x^{n+1} \pm Ax^n \pm Bx^{n-1} \ldots \pm Mx^2 \pm Nx \\ \quad -ax^n \mp Aax^{n-1} \ldots \mp Lax^2 \mp Max \mp Na \end{array}\right\}$$

the signs of the several terms remaining unchanged in the first line, and being all changed in the second line. It is

 evident, therefore, that the terms of the product will have the same signs with the respective terms of the proposed polynome, except when a co-efficient in the second line is greater than the one above it, and likewise has a contrary sign; the sign of the last term of the product being always the same with the sign of the last term of the second line. Now, beginning on the left hand, pass over the terms of the first line, so long as they have the same signs with the terms of the product. When this ceases to be the case, the signs in the product will be the same as in the second line, and contrary to those in the first line; wherefore descend to the second line, and pass along its terms till the signs in the product are again the same as those in the first line, and then ascend to that line. Continue thus descending and ascending alternately till all the terms in both lines are taken in. At the conclusion, it is evident that the descendings are always one more than the ascendings, because the passing from one line to another both begins and ends with descending.

If we descend from $\pm Ax^n$ in the first line, to $\mp Aax^{n-1}$ in the second line, it is evident that the signs of $\pm Ax^n$ and $\pm Bx^{n-}$ in the first line will be the same, both being contrary to the sign of $\mp Aax^{n-1}$ in the second line. Therefore, in the given polynome, the first and second terms have the same sign. But in the product the like terms have contrary signs; for the second term of the product has the same sign with $\pm Ax^n$ in the first line, and the third term of the product has the same sign with $\mp Aax^{n-1}$ in the second line. Thus it appears that a variation from one sign to another is introduced in the product, instead of a continuation of the same sign that takes place in the given polynome; and the same thing will happen at every descending.

In ascending from the second line to the first, there may either be a continuation of the product instead of a variation in the given polynome, or the contrary; but one of these two must take place.

Now, so long as we keep on the first line, the signs in the product are the same with those of the given polynome; and, so long as we keep on the second line, the signs in the product are contrary to those in the polynome. In both cases, therefore, the variations from + to — 1, and from — to + 1, are the same in the product and in the polynome. Every descending introduces a variation in the product, instead of a continuation that takes place in the polynome; and although it be supposed that every ascending introduces a continuation in the product instead of a variation that exists in the polynome, yet, on the whole, the variations introduced must be one more than the continuations, because the descendings are one more than the ascendings.

Again, if the given polynome be multiplied by $x + a$, the product will be the sum of these two lines, viz.

$$\left.\begin{array}{l} x^{n+1} \pm Ax^n \pm Bx^{n-1} \ldots \pm Mx^2 \pm Nx \\ \quad + ax^n \pm Aax^{n-1} \quad \pm Lax^2 \pm Max \pm Na. \end{array}\right\}$$

Here the terms of both lines have the same signs; and, as before, the signs in the product will be the same with the signs of the proposed polynome, unless when a co-efficient in the second line is greater than the one above it, and likewise has a contrary sign; the sign of the last term of the product being always the same with the sign of the last term in the second line. Now, if we pass along all the terms of both lines, descending from the first line to the second, when the signs in the product change from being the same with those in the given polynome, to be contrary to them; and ascending from the second line to the first, when the signs in the product change from being contrary to those in the polynome, to be the same with them; it is evident that the descendings will be one more than the ascendings, as in the former case.

If we descend from $\pm Ax^n$ in the first line, to $\pm Aax^{n-1}$ in the second line, the two terms $\pm Ax^n$ and $\pm Bx^{n-1}$ in the first line will have different signs; for on account of the descending, $\pm Bx^{n-1}$ has a contrary sign to the term $\pm Aax^{n-1}$ below it, and, consequently, to $\pm Ax^n$ in the first line. Therefore the second and third terms in the polynome have different signs. But the like terms in the product have the same sign; for the second term in the product has the same sign with $\pm Ax^n$ in the first line; and the third term of the product has the same sign with $\pm Aax^{n-1}$ in the second line. Thus there is a continuation of the same sign introduced in the product, instead of a variation from one sign to another that takes place in the polynome; and the same thing is true at every descending.

In ascending from the second line to the first, there may either be a variation in the product instead of a continuation that exists in the polynome, or the contrary. But one of these two must take place.

Now it is evident that, except at the descendings and ascendings, there is the same number of continuations of the same sign, and the same number of variations from one sign to another, in the product and in the given polynome. Every descending introduces a continuation in the product instead of a variation existing in the polynome. And even if we suppose that every ascending introduces a variation in the product instead of a continuation that takes place in the polynome, yet, on the whole, there will be one continuation more in the product than in the polynome, because the descendings are one more than the ascendings.

In the preceding demonstration, it is supposed that all the ascendings have a contrary effect to the descendings, by which means there is introduced in the product the least possible number of variations from one sign to another in the one case, and the least possible number of continuations of the same sign in the other. But if, in the first case, we suppose that, at one ascending, there is a variation in the product, and a continuation in the polynome, this will add one to the variations in the product, and one to the continuations in the polynome; so that the variations in the product will now exceed those in the polynome by three, namely, by two more than in the circumstances supposed in the demonstration. And if we extend the like reasoning to two, three, &c. ascendings, the variations in the product will exceed those in the polynome respectively by five, seven, &c. The like conclusion is evidently true of the second case, *mutatis mutandis;* and hence the preceding proposition, when it is generalized as much as it can be, may be thus enunciated: "If any rational polynome be multiplied by $x - a$, the variations from one sign to another in the product will exceed those in the polynome by one, or three, or five, or by some odd number; and if it be multiplied by $x + a$, the continuations of the same sign in the product will exceed those in the polynome by one, or three, or five, or by some odd number."

Now, if we conceive that any rational polynome is resolved into its binomial factors, there will be a factor of the form $x - a$ for every positive root, and one of the form $x + a$ for every negative root; and when all the factors are multiplied together in order to reproduce the polynome, it follows, from what has been proved, that the product will contain at least one change from + to —, or from — to + 1, for every factor of the form $x - a$, or for every positive root; and at least one succession of + to +, or of — to — 1, for every factor of the form $x + a$, or for every negative root. Hence this rule, viz. "An

Equations. equation cannot have more positive roots than it has variations from one sign to another, nor more negative roots than it has continuations of the same sign."

In general, this rule merely points out limits which the number of the positive and negative roots of an equation cannot exceed. But it gives no criterion by which we can certainly know that an equation has even one positive or one negative root, much less does it ascertain the exact number of each kind.

But if the proposed equation can be completely resolved into real binomial factors; in which case the total number of its roots will be equal to its dimensions, and consequently to the sum of all the variations from one sign to another, and of all the continuations of the same sign; it is evident that the number of the positive roots will be precisely equal to that of the variations, and the number of the negative roots precisely equal to that of the continuations. In this case, therefore, and in this case only, the rule of Descartes is perfect, ascertaining the exact number of each kind of roots in the proposed equation.

We subjoin some consequences that result from the principles laid down.

"If a polynome $f(x)$ of n dimensions be multiplied by $x-a$, or $x+a$; and, in the first case, if the number of variations from one sign to another be augmented by the odd number $2i+1$; or, in the second case, if the number of continuations of the same sign be augmented by $2i+1$; then the total number of the roots, positive and negative, of the proposed polynome, cannot be greater than $n-2i$."

For, when the multiplier is $x-a$, let m denote the number of the variations from one sign to another in the proposed polynome $f(x)$; then $m+2i+1$ will be the total number of variations in the product $(x-a)\times f(x)$; consequently the total number of continuations in $(x-a)\times f(x)$ will be equal to $(n+1)-(m+2i+1)$, or $n-m-2i$. But a polynome cannot have more negative roots than it has continuations of the same sign; wherefore the number of the negative roots of $(x-a)\times f(x)$ cannot be greater than $n-m-2i$. Now, the two polynomes $f(x)$ and $(x-a)\times f(x)$ have the same negative roots; and hence the number of the negative roots of $f(x)$ cannot exceed $n-m-2i$. But the number of the positive roots of $f(x)$ cannot exceed m; consequently the total number of the roots of $f(x)$ cannot be greater than $m+n-m-2i$; that is, than $n-2i$. And the proposition may be demonstrated in a similar manner when the multiplier is $x+a$.

"If one or several consecutive terms of an equation be wanting, and if the next terms on each side of those wanting have the same sign, the equation cannot have as many roots as it has dimensions."

Let the equation be $P+Q=0$, P and Q denoting the two parts on each side of the terms wanting. Having multiplied $P+Q$ by $x-a$, the product will be $(x-a)P+(x-a)Q$; and it is evident that we may consider P, Q, $(x-a)P$, $(x-a)Q$ as separate polynomes; hence, in each of the polynomes $(x-a)P$ and $(x-a)Q$, there will be at least one more variation from one sign to another than there is in P and Q. Again, in the polynome $P+Q$, there will be a continuation of the same sign in passing from P to Q; because the last term of P is supposed to have the same sign with the first term of Q. On the other hand, because the last term of $(x-a)P$ has a contrary sign to the last term of P; and the first term of $(x-a)Q$, the same sign with the first term of Q, it follows that, in the polynome $(x-a)P+(x-a)Q$, there will be a variation from one sign to another in passing from $(x-a)P$ to $(x-a)Q$. Therefore, on the whole, there will be at least three variations from one sign to another in $(x-a)P+(x-a)Q$, more than there is in $P+Q$. Consequently, by the last proposition, the number of all the roots of the proposed equation must be at least two less than its dimensions.

Number of real roots in an equation.

8. An important inquiry is, to find how many roots, that is, real roots, there are in any proposed equation. Much has been written on this subject, but not very successfully. No general method has been found that is practically useful. Many *criteria* have been contrived, by means of which we can certainly discover that roots are wanting in an equation, although we cannot infer the existence of the roots when the same criteria fail. But great value cannot be attached to such rules, since they are neither sufficient guides in practice, nor have much tendency to throw light on the theory.

Waring first, and nearly about the same time Lagrange, proposed a method which is successful in finding the conditions necessary in order that an equation have as many roots as it has dimensions, and which in all cases points out a limit that the number of the roots cannot exceed. This is effected by an auxiliary equation, and merely by the signs of its co-efficients, without requiring the computation of any of its roots. This procedure answers very well for equations of the third and fourth degrees; and it has even been extended by Waring to those of the fifth degree; but in this last case the calculation is very long, and would be altogether impracticable in the higher orders of equations. It is also not a little probable that this rule employs more conditions than are absolutely necessary for determining the point in question; there being great reason to think that some of them are implied in the rest, and are deducible from them. The method here alluded to depends upon the theory of trinomial divisors; and as it is much referred to by algebraists of the present day, we shall, in a subsequent part of this article, briefly explain the principles on which it is founded.

There is also another way of finding the number of real roots in an equation, which is general for all orders, and requires the solution of such equations only as are of lower dimensions than the one proposed. As to practical utility, indeed, this method is of little avail in equations passing the third and fourth degrees, or at most the fifth degree; but it is nevertheless not without interest, both because it is founded on the principles essential to the inquiry, and because it leads to some useful properties. Algebraists differ from one another in their exposition of this method. Some derive it from the theory of Harriot, namely, that every rational polynome is the product of as many binomial factors as it has dimensions; in which manner of proceeding the impossible roots are the occasion of uncertainty and embarrassment. Others, again, deduce it from the variations of magnitude which a rational polynome undergoes when the unknown quantity is made to pass through all possible degrees of increasing and decreasing. This last mode of investigation seems greatly to deserve the preference, being in reality the only one that is entirely unexceptionable, and requires no principles foreign to the research.

Suppose an equation, $x^n+Ax^{n-1}+Bx^{n-2}\ldots\ldots+Mx+N=0$, which we may denote by $f(x)=0$: substitute $x-i$ in place of x, and put

$$X=f(x)=x^n+Ax^{n-1}\ldots\ldots+Mx+N,$$
$$X'=nx^{n-1}+(n-1)Ax^{n-2}+(n-2)Bx^{n-2}\ldots+M,$$
$$X''=n\cdot\frac{n-1}{2}x^{n-2}+(n-1)\cdot\frac{n-2}{2}Ax^{n-3}+,\ \&c.\ \&c.$$

then the function $f(x-i)$ will be transformed into

$$X-X'.i+X''.i^2-X'''.i^3+,\ \&c.$$

If we suppose the notation of the differential calculus, the same transformation will be thus represented:

$$f(x)-\frac{d.f(x)}{dx}\cdot i+\frac{1}{2}\cdot\frac{d^2.f(x)}{dx^2}\cdot i^2-, \&c.;$$

which has the advantage of pointing out in what manner the several functions, X′, X″, &c. are derived from one another, and from the first function X, or $f(x)$.

Let α, β, γ, &c. denote the real roots of the equation $X=0$, or $f(x)=0$, arranged according to the order of their magnitude, that is, α greater than β, β greater than γ, and so on. In like manner, observing the same order of arrangement, let α', β', γ', &c. represent the roots of $X'=0$, or $\frac{d.f(x)}{dx}=0$; and, for the sake of simplicity, suppose that the equation $X'=0$ has no equal roots.

The relations which the variations of the polynome X bear to the variations of x, depend upon the functions X′, X″, &c. and principally upon the first of these. If X′ be positive, X will decrease as x decreases; if X′ be negative, X will increase as x decreases; and if X′ pass from being positive to become negative, or the contrary, then x continuing to decrease, X will change from decreasing to increasing, or the contrary; that is, it will attain a minimum or a maximum value. What is here said is the foundation of the method taught in the differential calculus, for finding the maxima and minima of algebraic quantities.

Now, when x has a value great enough, the polynome X′ will have the same sign with its first term, that is, it will be positive; and it will continue positive so long as x is greater than α', the greatest root of the equation $X'=0$; after which it will become negative. Hence, while x decreases to the limit α', the polynome $f(x)$, which is positive when x is sufficiently great, will continually decrease; and when $x=\alpha'$, $f(x)$ will pass from decreasing to increasing, or it will have a minimum value. Now if this minimum $f(\alpha')$ be positive, $f(x)$ has not decreased to zero, and the given equation will have no root greater than α'. If $f(\alpha')=0$, then, because the two equations $X=0$ and $X'=0$, take place at the same time, the given equation will have two roots equal to α'. (Sect. 6.) *Lastly*, if $f(\alpha')$ be negative, the polynome $f(x)$ has decreased from being positive to be negative; and therefore it has passed through zero, and the given equation will have one root, viz. α greater than α'.

As x continues to decrease from α' to β', the polynome X′ being negative, $f(x)$ will continually increase. At the limit $x=\beta'$, X′ is first equal to zero, and then becomes positive; and $f(x)$ will therefore change from increasing to decreasing, or will attain a maximum value. If this maximum $f(\beta')$ be negative, the polynome $f(x)$ has not increased to zero, and the given equation will have no root between α' and β': if $f(\beta')=0$, it will have two roots equal to β: and if $f(\beta')$ be positive, $f(x)$, in increasing from the negative quantity $f(\alpha')$ to the positive quantity $f(\beta')$, must have passed through zero, and the given equation will have one root, viz. β, between α' and β'.

In like manner, x continuing to decrease from β' to γ', the polynome $f(x)$ will decrease from the maximum $f(\beta')$ to the minimum $f(\gamma')$: if $f(\gamma')$ be positive, the proposed equation will have no root between β' and γ'; if $f(\gamma')=0$, it will have two roots equal to γ'; and if $f(\gamma')$ be negative, it will have one root, viz. γ, between the limits β' and γ'.

As the function $f(x)$ must become a minimum or a maximum, or must pass from decreasing to increasing, or the contrary, between every two contiguous roots of the equation $f(x)=0$; and as the limits where the changes take place are determined by the roots of the equation $X'=0$; it follows that there must be at least one root of this last equation between every two contiguous roots of the first. Hence the equation $f(x)=0$ cannot have as many roots as dimensions, unless the equation $X'=0$ likewise have as many roots as dimensions; and in general we have this rule, which determines a limit that the number of the roots of an equation cannot surpass, although it may fall short of it: "The roots of an equation $f(x)=0$ cannot exceed in number those of the equation $\frac{df(x)}{dx}=0$, by more than one."

But if we can find the roots of the equation $X'=0$, which is always one degree lower than the proposed equation, we can thence discover exactly both the number and the limits of the roots of this last. For let α', β', γ', &c. be substituted in the polynome $f(x)$, and let the results be arranged in order, viz.

$$\underset{-}{f(\alpha')},\underset{+}{f(\beta')},\underset{-}{f(\gamma')},\underset{+}{f(\delta')}, \&c.:$$

if these quantities are alternately negative and positive; the first, third, fifth, &c. which are all minima, having the sign *minus;* and the second, fourth, &c. which are all maxima, having the sign *plus;* then the proposed equation $f(x)=0$ will have just one root more than the equation $X'=0$. When some of the conditions fail, the roots of the proposed equation will fall short of the number specified. If one maximum have the sign *minus*, or one minimum the sign *plus*, two roots will be wanting in the proposed equation; and in general as many roots will disappear, as there are consecutive minima and maxima that have the same sign deducting one; unless the minima and maxima precede the greatest root, or come after the least root, in which cases there will be as many roots wanting as there are minima and maxima that have the same sign.

Since the series of functions, X, X′, X″, &c. are derived similarly from one another, we may prove, as has been done with respect to the two first, that the roots of any one are contained between the roots of that which follows it. Hence, if the given equation have as many roots as dimensions, every equation in the series will likewise have as many roots as dimensions; and if there be roots wanting in any one, there will be at least as many wanting in every equation preceding it in the series.

The connected equations necessarily terminate in one of the first degree, which gives a limit between the two roots of the quadratic immediately before it; in like manner, the roots of the quadratic are the limits of the roots of the cubic preceding it; and in this manner, by going through all the successive equations, we shall finally arrive at the limits of the roots of the proposed equation. This process has been called *La Methode des Cascades;* but the length of the calculations renders it useless in practice.

The procedure explained above would enable us to find the number of roots in an equation of any order, if we were in possession of rules for solving equations of the inferior degrees. For want of such rules, the practical advantage that can be derived from it is very limited. Mathematicians have therefore turned their attention to determine the point in question in a way that should not require the resolution of equations. They have sought to investigate rational functions of the co-efficients, which, by means of the signs they are affected with in every particular case, might indicate the number of roots the equation possesses. Of this nature is the method which Du Gua has given in the *Mémoires de Paris*, 1741, for finding the conditions necessary in order that an equation have as many roots as dimensions. By a process analogous to that of Du Gua, M. Cauchy, in an excellent *Me-*

moir, published in the sixteenth volume of the *Journal de l'Ecole Polytechnique*, has shown not only that the total number of the roots may in every case be discovered, but likewise that the numbers of the positive and negative roots may be separately ascertained. The principles of both these methods are to be found in the theory explained above; but as many considerations of some intricacy are involved in them, a particular account of them would exceed the limits of this article.

In what goes before, we have supposed that all the roots of the equation $X' = 0$ are unequal; and in order to complete the theory, it remains to notice the consequences that follow when the case is otherwise. Suppose, then, that $X' = (x-\lambda)^i \times Q$: And, in the first place, if λ be a root of the equation $f(x) = 0$, there will in reality be no exception to the general conclusion; because in this case it is known that the polynome $f(x)$ will be divisible by $(x-\lambda)^{i+1}$. (Sect. 6.) Now, the case just mentioned being set aside, if i be an even number, the polynome X', or $(x-\lambda)^i \cdot Q$, will be equal to zero when $x = \lambda$; but it will not change its sign when x, from being less, comes to be greater than λ. Hence the polynome $f(x)$ will neither attain a maximum nor a minimum value at the same limit; and it will have no root, either between λ and the next greater root of the equation $X' = 0$, or between λ and the next less root of the same equation. It appears, therefore, that when i is even, the number of the roots of the equation $f(x) = 0$, and their limits, will depend entirely upon the equation $Q = 0$. Again, when i is an odd number, the polynome X' will be equal to zero when $x = \lambda$, and it will likewise change its sign when x is taken on contrary sides of that limit: Consequently, when $x = \lambda$, the polynome $f(x)$ will be a maximum or a minimum; and the nature of its roots will depend upon the equation $(x-\lambda)\, Q = 0$. It is evident that we may extend the same conclusions to any two adjacent equations in the series,

$$X = 0,\ X' = 0,\ X'' = 0,\ X''' = 0, \ \&c.$$

provided the one which stands lower in the series is reducible to the form $(x-\lambda)^i Q$; and that $x-\lambda$ is not a common divisor of both. We may likewise draw this general inference from the principles that have been explained, viz. "If, in the series of connected equations, any one be found which is divisible by $(x-\lambda)^{2i}$, or $(x-\lambda)^{2i+1}$, at the same time that $x-\lambda$ is not a divisor of the equation immediately preceding, there will be at least $2i$ roots wanting in this last equation, and in all that stand before it in the series."

The following not inelegant proposition is a consequence of what has just been proved: "The number of the roots of an equation of n dimensions, in which $2i$ or $2i+1$, consecutive terms, are wanting, cannot be greater than $n-2i$."

Let the equation be represented by

$$P + Q = 0;$$

supposing that $2i$, or $2i+1$ terms, are wanting between P and Q. Therefore, if the first term of Q contain x^m, the last term of P will contain x^{m+2i+1}, or x^{m+2i+2}. Now, in the series of equations, we shall at length arrive at one from which all the quantities of Q are exterminated; which equation, if we use the notation of the differential calculus, is equivalent to

$$\frac{d^{m+1}P}{dx^{m+1}} = 0;$$

and it is divisible by x^{2i}, or x^{2i+1}: And as the one immediately preceding it in the series, viz.

$$\frac{d^mP}{dx^m} + \frac{d^mQ}{dx^m} = 0,$$

is not divisible by x, it follows, from what has been shown, that there will be at least $2i$ roots wanting in this last equation, and in all those that stand before it; consequently the proposed equation cannot have more than $n-2i$ roots.

From this we learn that it is not always possible, at least by any operations with real quantities, to transform an equation into another in which any proposed number of the intermediate terms shall be wanting. For the terms to be taken away may be such that the transformed equation could not have the same number of real roots as the one given; but it is impossible, without introducing imaginary quantities, to transform an equation with a certain number of real roots into another with a different number of such roots.

9. In what goes before, we have sought for the roots and binomial divisors in the nature of the polynome. We are now to take an inverted view of the subject, and to consider a rational polynome as produced by the continued multiplication of as many binomial factors as it has dimensions; from which source there arises an interesting set of properties.

If we take the words root and binomial factor strictly in the sense in which we have hitherto used them, and as denoting real quantities only, nothing is more certain than that all polynomes cannot be generated by binomial factors. But it will afterwards be proved that every rational polynome can be completely exhausted by binomial and trinomial divisors; and if we admit the resolution of every trinomial divisor into two imaginary factors, we shall arrive, with all the rigour of which the investigation is capable, at the genesis of equations supposed by Harriot, which represents them as entirely composed of binomial factors, possible or impossible. Besides, in extending to all equations the conclusions obtained from the manner of generating them, it may be observed that the properties so obtained, being ultimately expressed in functions of the co-efficients from which the roots and generating factors have disappeared, are in a manner independent of the method of investigation. Such is the structure of the language of algebra, that the conclusions to which it leads, although deduced by reasoning from a hypothesis not strictly general, are nevertheless true in all cases, when they are finally disengaged from what is peculiar in the analysis.

Suppose a polynome, as

$$x^n - A^{(1)}x^{n-1} + A^{(2)}x^{n-3} \ldots \pm A^{(n-1)}x \mp A^{(n)},$$

which is produced by the multiplication of the n factors,

$$(x-\alpha)\cdot(x-\beta)(x-\gamma)(x-\delta), \ \&c.$$

then, by actually multiplying the factors, and equating the like terms of the equivalent expressions, we shall get

$$A^{(1)} = \alpha + \beta + \gamma + \delta +, \&c.$$
$$A^{(2)} = \alpha\beta + \alpha\gamma +, \&c. + \beta\gamma +, \&c.$$
$$A^{(3)} = \alpha\beta\gamma + \alpha\beta\delta +, \&c. + \beta\gamma\delta +, \&c.$$
$$A^{(4)} = \alpha\beta\gamma\delta +, \&c.$$
&c.

Hence it appears that the co-efficient of the second term of the polynome, or $-A^{(1)}$, is equal to the sum of all the roots with their signs changed; the co-efficient of the third term, or $+A^{(2)}$, to the sum of all the products of every two roots; the co-efficient of the fourth term,

or $-A^{(3)}$, to the sum of all the products of every three roots with their signs changed, and so on, the signs of the roots being always changed in the products of an odd number; and finally, the last term is the product of all the roots with their signs changed or not, according as their number is odd or even.

It is evident that the ultimate product of the binomial factors will always be the same, in whatever order they are multiplied; and hence the co-efficients of the polynome will consist of the same products, however the roots be interchanged among one another. Expressions of the kind just mentioned, which have constantly the same value, whatever change is made in the order of the quantities they contain, are called *invariable functions* and *symmetrical functions.* The co-efficients of an equation are the most simple symmetrical functions of the roots, from which it may be required, on the one hand to deduce all other functions of the like kind, and on the other to go back to the roots themselves. Most inquiries relating to equations are connected with one or other of these two problems; of which the first, like most direct methods, is attended with little difficulty, and has been completely solved; while the other, past equations of the fourth degree, has eluded all the attempts of algebraists.

After the co-efficients of the polynome, the next most simple symmetrical functions of the roots are the sums of the squares, cubes, &c. In the universal arithmetic of Sir Isaac Newton, a very elegant rule is given for computing the sum of any proposed powers of the roots; and as this rule is a fundamental point in the theory of equations, we subjoin an elementary investigation of it.

Of the binomial factors before set down, let the first $x-\alpha$ be left out, and having multiplied the rest together, let the product be

$$x^{n-1}-\varphi^{(1)}x^{n-2}+\varphi^{(2)}x^{n-3}-\varphi^{(3)}x^{n-4}+,\&c.;$$

in which expression $\varphi^{(1)}$ is the sum of all the roots β, γ, δ, &c. except the first α; $\varphi^{(2)}$ is the sum of the products of every two of them, and so on. Now, multiply by $x-\alpha$, and the product will be equivalent to the given polynome: hence we get

$$\begin{aligned}
A^{(1)}&=\alpha+\varphi^{(1)},\\
A^{(2)}&=\alpha.\varphi^{(1)}+\varphi^{(2)},\\
A^{(3)}&=\alpha.\varphi^{(2)}+\varphi^{(3)},\\
&\vdots\\
A^{(r)}&=\alpha.\varphi^{(r-1)}+\varphi^{(r)}.
\end{aligned}$$

Again, multiply these formulæ in order by α^{r-1}, α^{r-2}, α^{r-3}, &c.; then

$$\begin{aligned}
\alpha^r&=\alpha^r,\\
A^{(1)}.\alpha^{r-1}&=\alpha^r+\alpha^{r-1}.\varphi^{(1)},\\
A^{(2)}.\alpha^{r-2}&=\alpha^{r-1}.\varphi^{(1)}+\alpha^{r-2}.\varphi^{(2)},\\
&\vdots\\
A^{(r-1)}.\alpha&=\alpha^2\varphi^{(r-2)}+\alpha.\varphi^{(r-1)},\\
A^{(r)}&=\alpha.\varphi^{(r-1)}+\varphi^{(r)};
\end{aligned}$$

and, by adding and subtracting alternately, we get

$$\alpha^{(r)}-A^{(1)}.\alpha^{r-1}+A^{(2)}.\alpha^{r-2}\ldots\pm A^{(r-1)}.\alpha \mp A^{(r)}=\mp\varphi^{(r)},$$

in which expression $\varphi^{(r)}$ is the sum of all the products of r dimensions of the roots β, γ, δ, &c. leaving out the first α.

In like manner, if we leave out the factor $x-\beta$, and multiply all the rest, and proceed as before, we shall get

$$\beta^r-A^{(1)}\beta^{r-1}+A^{(2)}\beta^{r-2}\ldots\pm A^{(r-1)}\beta\mp A^{(r)}=\pm\varphi'^{(r)},$$

the symbol $\varphi'^{(r)}$ being the sum of the products of r dimensions of all the roots, α, γ, δ, except the second β.

And if we next leave out the factor $x-\gamma$, and follow a like procedure, we shall get

$$\gamma^r-A^{(1)}.\gamma^{r-1}+A^{(2)}.\gamma^{r-2}\ldots\pm A^{(r-1)}.\gamma\mp A^{(r)}=\mp\varphi''^{(r)};$$

where $\varphi''^{(r)}$ represents the sum of the products of r dimensions of all the roots α, β, δ, &c. except the third γ.

If we proceed similarly till every one of the n factors is left out in its turn, and then add all the results, we shall get

$$S_r-A^{(1)}S_{r-1}+A^{(2)}S_{r-2}\ldots\pm A^{(r-1)}S_1 \mp nA^{(r)}=\mp\left\{\varphi^{(r)}+\varphi'^{(r)}+\varphi''^{(r)}+,\&c.\right\};$$

in which expression S_r is written for the sum of the r powers of the roots; S_{r-1} for the sum of the $(r-1)$ powers, and so on.

Every product in any one of the aggregate quantities $\varphi^{(r)}, \varphi^{(r)}, \varphi''^{(r)}$, &c., is found in $A^{(r)}$, which is the sum of the products of r dimensions of all the roots; and hence it is easy to perceive that the sum of all the aggregates must be a multiple of $A^{(r)}$. Take any product in $A^{(r)}$; then that product will not be contained in r of the quantities $\varphi^{(r)}, \varphi'^{(r)}, \varphi''^{(r)}$, &c.; because, in so many of them, one or other of the letters of the product will be wanting; but the same product will be contained once in every one of the $n-r$ remaining quantities, because in every one of these all the letters of the product will be contained. Every product in $A^{(r)}$ is therefore repeated $n-r$ times in the sum of the quantities $\varphi^{(r)}, \varphi'^{(r)}, \varphi''^{(r)}$, &c.; consequently,

$$\varphi^{(r)}+\varphi'^{(r)}+\varphi''^{(r)}+,\&c.=(n-r)A^{(r)}.$$

Substitute this value in the formula obtained above, and after transposing and cancelling $nA^{(r)}$, which appears with contrary signs, we shall get

$$S_r-A^{(1)}S_{r-1}+A^{(2)}S_{r-2}\ldots\pm A^{r-1}S \mp rA^{(r)}=0.$$

This is the rule of Sir Isaac Newton, and contains all his particular formulæ, as will readily appear by putting 1, 2, 3, &c. successively for r.

The preceding formula will enable us to compute, in succession, the sums of all the positive powers of the roots, both when r is less and when it is greater than the dimensions of the equation. But, in applying the formula in the latter case, we must observe that all the co-efficients of the polynome after $A^{(r)}$ are wanting, or equal to nothing.

If, in the first step of the preceding investigation, we take the co-efficients that follow $A^{(r)}$, we shall get

$$\begin{aligned}
A^{(r+1)}&=\alpha.\varphi^{(r)}+\varphi^{(r+1)},\\
A^{(r+2)}&=\alpha.\varphi^{(r+1)}+\varphi^{(r+2)},
\end{aligned}$$

$$A^{(n-1)} = \alpha\varphi^{(n-2)} + \varphi^{(n-1)},$$
$$A^{(n)} = \alpha \cdot \varphi^{(n-1)}.$$

And, by first dividing by α, α^2, α^3, &c. in order, and then subtracting and adding alternately, we shall obtain

$$\frac{A^{(r+1)}}{\alpha} - \frac{A^{(r+2)}}{\alpha^2} + \frac{A^{(r+3)}}{\alpha^3} -, \&c. = \varphi^{(r)}.$$

In a similar manner we get

$$\frac{A^{(r+1)}}{\beta} - \frac{A^{(r+2)}}{\beta^2} + \frac{A^{(r+3)}}{\beta^3} -, \&c. = \varphi'^{(r)},$$
$$\frac{A^{(r+1)}}{\gamma} - \frac{A^{(r+2)}}{\gamma^2} + \frac{A^{(r+3)}}{\gamma^3} -, \&c. = \varphi''^{(r)}, \&c.$$

Therefore, by adding all these formulæ, and substituting for the sum of $\varphi^{(r)}$, $\varphi'^{(r)}$, &c. the value of it already found, we shall finally obtain

$$A^{(r+1)} S_{-1} - A^{(r+2)} S_{-2} + A^{(r+3)} S_{-3} -, \&c.$$
$$= (n-r) A^{(r)},$$

the symbols S_{-1}, S_{-2}, &c. being put for the sums of the negative powers of the roots according to the indices underwritten. This formula will enable us to compute the sums of the negative powers of the roots.

If, in the formula for the sums of the positive powers of the roots, we make r successively equal to 1, 2, 3, &c. we shall get

$$A^{(1)} = S_1,$$
$$-2A^{(2)} = -A^{(1)} S_1 + S_2,$$
$$3A^{(3)} = A^{(2)} S_1 - A^{(1)} S_2 + S_3,$$
$$-4A^{(4)} = -A^{(3)} S_1 + A^{(2)} S_2 - A^{(1)} S_3 + S_4, \&c.$$

and from this we learn that the quantities S_1, S_2, S_3, &c. may be found by means of this expression, viz.

$$\frac{A^{(1)} - 2A^{(2)} z + 3A^{(3)} z^2 \ldots \pm A^{(n)} z^{n-1}}{1 - A^{(1)} z + A^{(2)} z^2 \ldots \pm A^{(n)} z^n} = S_1$$
$$+ S_2 \cdot z + S_3 \cdot z^2 +, \&c.$$

for if we multiply the series on the right-hand side of the sign of equality, by the denominator of the fraction on the other side, and then equate the co-efficients of the product to the like co-efficients of the numerator, we shall obtain the very formulæ set down above. Hence the sums of the powers of the roots expressed in terms of the co-efficients of the polynome will be found by developing the fraction in a series. In effecting the development different analytical methods may be followed; and the quantities sought will thus be obtained by different rules, or exhibited in expressions of different forms, such as those given by Waring, Vandermonde, Euler, and La Grange.

And in like manner, if, in the formula for the sums of the negative powers of the roots, we make r successively equal to $n-1$, $n-2$, $n-3$, &c. we shall get

$$A^{(n-1)} = A^{(n)} S_{-1},$$
$$-2A^{(n-2)} = -A^{(n-1)} S_{-1} + A^{(n)} S_{-2},$$
$$3A^{(n-3)} = A^{(n-2)} S_{-1} - A^{(n-1)} S_{-2} + A^{(n)} S_{-3},$$
$$-4A^{(n-4)} = -A^{(n-3)} S_{-1} + A^{(n-2)} S_{-2}$$
$$- A^{(n-1)} S_{-3} + A^{(n)} S_{-4},$$
&c.

from which it appears that the values of all the quantities S_{-1}, S_{-2}, S_{-3}, &c. will be obtained by means of this expression, viz.

$$\frac{A^{(n-1)} - 2A^{(n-2)} z + 3A^{(n-3)} z^2 -, \&c.}{A^{(n)} - A^{(n-1)} z + A^{(n-2)} z^2 -, \&c.} = S_{-1}$$
$$+ S_{-2} \cdot z + S_{-3} \cdot z^2 +, \&c.$$

Two kinds of quantities only can enter into any rational and symmetrical function of the roots of an equation; and these are the sums of the like powers of the roots, and the sums of such products as, $\alpha^i \beta^{i'} \gamma^{i''}$, &c. which arise from multiplying different powers of the roots, two and two, three and three, &c. We shall now shortly point out in what manner the latter sums are deduced from the sums of the like powers, for the computation of which rules have already been given; by which means we shall be enabled to find the value of any proposed function of the kind above mentioned.

Let it be required to find the sum of all the products, such as $\alpha^i \beta^{i'}$, that arise from combining two powers of the roots in all possible ways; which sum may be denoted by the symbol $\Sigma \, . \, \alpha^i \beta^{i'}$. Now it is evident that the product, $S_i \times S_{i'}$, will contain two sorts of terms only, namely, powers of the roots, such as $\alpha^{i+i'}$, and the products of which the sum is sought; therefore

$$\Sigma \, . \, \alpha^i \beta^{i'} = S_i \times S_{i'} - S_{i+i'}.$$

Next let it be required to find $\Sigma \, . \, \alpha^i \beta^{i'} \gamma^{i''}$, or the sum of all the products of three powers of the root. Now $\Sigma \, . \, \alpha^i \beta^{i'} \times S_{i''}$ will contain three sorts of terms, namely, products, such as $\alpha^{i+i''} \beta^{i'}$ and $\alpha^{i'+i''} \beta^i$, in which two roots only are combined, and the products of which the sum is required; therefore

$$\Sigma \, . \, \alpha^i \beta^{i'} \gamma^{i''} = \Sigma \alpha^i \beta^{i'} \times S_{i''}$$
$$- \Sigma \, . \, \alpha^{i+i''} \beta^{i'}$$
$$- \Sigma \, . \, \alpha^{i'+i''} \beta^i :$$

but, according to the last case,

$$\Sigma \, . \, \alpha^{i+i''} \beta^{i'} = S_{i+i''} \times S_{i'} - S_{i+i'+i''},$$
$$\Sigma \, . \, \alpha^{i'+i''} \beta^i = S_{i'+i''} \times S_i - S_{i+i'+i''} :$$

wherefore

$$\Sigma \, . \, \alpha^i \beta^{i'} \gamma^{i''} = S_i \times S_{i'} \times S_{i''}$$
$$- S_{i+i'} \times S_{i''}$$
$$- S_{i+i''} \times S_{i'}$$
$$- S_{i'+i''} \times S_i$$
$$+ 2S_{i+i'+i''}.$$

In like manner, when four different powers of the roots are multiplied together, we get

$$\Sigma \, . \, \alpha^i \beta^{i'} \gamma^{i''} \delta^{i'''} = \Sigma \, . \, \alpha^{i} \beta^{i'} \gamma^{i''} \times S_{i'''}$$
$$- \Sigma \, . \, \alpha^{i+i'''} \beta^{i'} \gamma^{i''}$$
$$- \Sigma \, . \, \alpha^{i'+i'''} \beta^i \gamma^{i''}$$
$$- \Sigma \, . \, \alpha^{i''+i'''} \beta^{i'} \gamma^i ;$$

and we have only to apply the preceding case in order to obtain the expression of the quantity sought in terms of the sums of the like powers of the roots.

According to the procedure just explained, the case where any number of powers are multiplied together, is reduced to the simpler case where the powers multiplied are one less. There would be no great difficulty in de-

Equations. ducing a general formula for the sum when the products contain any proposed number of different powers; but this would lead to calculations incompatible with the length of this article; and it may be doubted whether the use of such a formula is preferable in any cases likely to occur in practice, to the application of the principles here laid down.

The theory of symmetrical functions is of the most extensive use in every branch of the doctrine of equations. Thus, if it be required to form an equation, the roots of which shall be any combinations of the roots of a given equation; it is manifest that the co-efficients of the equation sought will be symmetrical functions of the roots of the given equation; and hence they may be found by calculating these functions in terms of the co-efficients of the given equation.

The theory of symmetrical functions is also of use in approximating to the roots of numerical equations. Sir Isaac Newton seems to have had this application in view in giving his rule for computing the sums of the like powers of the roots. He observes that the powers of a great number increase in a much higher ratio than the same powers of less numbers; and hence the $2r^{\text{th}}$ power of the greatest root of an equation will approach nearer to the sum of the $2r^{\text{th}}$ powers of all the roots as r is greater. Wherefore, neglecting the distinction between positive and negative roots, if we calculate S_{2r}, and then extract its $2r^{\text{th}}$ root, we shall have an approximation to the root of the equation greatest in point of magnitude; and the approximation will be so much more accurate as r is greater.

But there is a more convenient way of approximating to the greatest and least roots of an equation, by means of symmetrical functions. For, since

$$S_{r+1} = \alpha^{r+1} + \beta^{r+1} +, \&c.$$

$$S_r = \alpha^r + \beta^r +, \&c.$$

we have

$$\frac{S_{r+1}}{S_r} = \alpha \cdot \frac{1 + \dfrac{\beta^{r+1}}{\alpha^{r+1}} +, \&c.}{1 + \dfrac{\beta^r}{\alpha^r} +, \&c.};$$

Now, α being the greatest root, the fraction on the right-hand side will approach to unit when r is sufficiently large, in which case $\dfrac{S_{r+1}}{S_r}$ will be nearly equal to α. Hence, if we compute a series of consecutive sums, viz. S_r, S_{r+1}, S_{r+2}, &c.; the values

$$\frac{S_{r+1}}{S_r}, \frac{S_{r+2}}{S_{r+1}}, \frac{S_{r+3}}{S_{r+2}}, \&c.$$

will approach nearer and nearer to the greatest root of the equation.

In like manner, if we take the sums of the negative powers of the roots, we shall have

$$\frac{S_{-r}}{S_{-r-1}} = \alpha \cdot \frac{1 + \dfrac{\alpha}{\beta^r} +, \&c.}{1 + \dfrac{\alpha^{r+1}}{\beta^{r+1}} +, \&c.};$$

from which it appears that $\dfrac{S_{-r}}{S_{-r-1}}$ will approximate so much more to α, the least root of the equation, as r is greater. Equations.

Trinomial Divisors.

10. We proceed next to consider the trinomial divisors of a given polynome; and, in order to avoid reference to other treatises, we shall begin with a short investigation of a preliminary point.

We have this identical expression,

$$x^2 - y^2 = (x+y) \cdot (x-y):$$

consequently,

$$(x^2 - y^2)^n = (x+y)^n \cdot (x-y)^n;$$

and again,

$$(x^2 - y^2)^n = \frac{1}{4} \cdot \left\{ (x+y)^n + (x-y)^n \right\}^2 - \frac{1}{4} \cdot \left\{ (x+y)^n - (x-y)^n \right\}^2$$

Now, using the letters H and G as the characteristics of the particular functions under consideration, let

$$H_n(x, y^2) = \frac{1}{2} \cdot \left\{ (x+y)^n + (x-y)^n \right\},$$

$$G_n(x, y^2) = \frac{1}{2} \cdot \frac{(x+y)^n - (x-y)^n}{y};$$

or by expanding the binomial quantities in series,

$$H_n(x, y^2) = x^n + n \cdot \frac{n-1}{2} \cdot x^{n-2} y^2 +, \&c.$$

$$G_n(x, y^2) = nx^{n-1} + n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} x^{n-3} y^2 +, \&c.;$$

then, by means of these notations, the preceding expression will be thus written, viz.

$$(x^2 - y^2)^n = \left\{ H_n(x, y^2) \right\}^2 - y^2 \cdot \left\{ G_n(x, y^2) \right\}^2.$$

This equation is identical; that is, when the expressions on both sides of the sign of equality are expanded in series of terms containing the powers of y^2, they will consist of the same quantities with the same signs. It is evident, therefore, that the equation will still be identical if we change y^2 into $-y^2$; for by this change the simple quantities of the developed expressions will not be affected, and no alteration will be produced, except in the signs of the odd powers of y^2, which will now be contrary to what they were before. We therefore have

$$(x^2 + y^2)^n = \left\{ H_n(x, -y^2) \right\}^2 + y^2 \cdot \left\{ G_n(x, -y^2) \right\}^2;$$

in which equation it is to be observed that the functional expressions are not, as in the former instance, susceptible of an abridged algebraic notation, at least without introducing a new sign; but they can be exhibited in series, viz.

$$H_n(x, -y^2) = x^n - n \cdot \frac{n-1}{2} \cdot x^{n-2} y^2 + n \cdot \frac{n-1 \cdot n-2 \cdot n-3}{2 \cdot 3 \cdot 4} x^{n-4} y^2 -, \&c.$$

$$G_n(x, -y^2) = nx^{n-1} - n \cdot \frac{n-1 \cdot n-2}{2 \cdot 3} x^{n-3} y^2 +, \&c.$$

Now put $x = r \cos. \varphi$, $y = r \sin. \varphi$, $x^2 + y^2 = r^2$; and let $\varphi^{(n)}$ denote an arc, depending, in a certain manner, not yet discovered, upon the arc φ and the index n; then, in consequence of the equation obtained above, we shall have

$$r^n \cos. \varphi^{(n)} = H_n(x, -y^2),$$

$$r^n \sin. \varphi^{(n)} = y G_n(x, -y^2).$$

Again, multiply both sides of the same equation last referred to by $x^2 + y^2$; then

$$(x^2+y^2)^{n+1}=\left\{x\,.\,\mathrm{H}_n(x,-y^2)-y^2\mathrm{G}_n(x,-y^2)\right\}^2$$
$$+y^2\left\{\mathrm{H}_n(x,-y^2)+x\mathrm{G}_n(x,-y^2)\right\}^2,$$

but, since the equation alluded to is general for all the values of n, we may write $n+1$ for n; and thus we get

$$(x^2+y^2)^{n+1}=\left\{\mathrm{H}_{n+1}(x,-y^2)\right\}^2$$
$$+y^2\left\{\mathrm{G}_{n+1}(x,-y^2)\right\}^2:$$

therefore, by comparing the two values of $(x^2+y^2)^{n+1}$

$$\mathrm{H}_{n+1}(x,-y^2)=x\,.\,\mathrm{H}_n(x,-y^2)-y^2\mathrm{G}(x,-y^2),$$
$$y\mathrm{G}_{n+1}(x,-y^2)=y\mathrm{H}_n(x,-y^2)+yx\mathrm{G}n(x,-y^2):$$

and finally, by substituting the values of the functions in terms of the arcs, φ, $\varphi^{(n)}$, $\varphi^{(n+1)}$, we shall obtain

$$\cos.\varphi^{(n+1)}=\cos.\varphi\cos.\varphi^{(n)}-\sin.\varphi\sin.\varphi^{(n)}=\cos.(\varphi^{(n)}+\varphi),$$
$$\sin.\varphi^{(n+1)}=\cos.\varphi\sin.\varphi^{(n)}+\sin.\varphi\cos.\varphi^{(n)}=\sin.(\varphi^{(n)}+\varphi),$$
$$\varphi^{(n+1)}=\varphi^{(n)}+\varphi.$$

Now, if we make n successively equal to 1, 2, 3, &c. the results will be,

$$\varphi^{(2)}=2\varphi,$$
$$\varphi^{(3)}=3\varphi,$$
&c.

and generally, $\varphi^{(n)}=n\varphi$.

Thus it appears that

$$r^n\cos.n\varphi=\mathrm{H}_n(x,-y^2),$$
$$r^{n-1}\times\frac{\sin.n\varphi}{\sin.\varphi}=\mathrm{G}_n(x,-y^2);$$

or, if we take the expanded expressions of the functions,

$$r^n\cos.n\varphi=x^n-n.\frac{n-1}{2}x^{n-2}y^2+$$
$$n.\frac{n-1\,.\,n-2\,.\,n-3}{2\,.\,3\,.\,4}x^{n-4}y^2-,\ \&c.$$
$$r^{n-1}\times\frac{\sin.n\varphi}{\sin.\varphi}=nx^{n-1}-n.\frac{n-1\,.\,n-2}{2\,.\,3}x^{n-3}y^2+,\ \&c.$$

in which formulæ, $x=r\cos.\varphi$, $y=r\sin.\varphi$.

The functions here designated by the letters H and G may be expressed by means of the imaginary sign; for we have

$$\mathrm{H}_n(x,-y^2)=\frac{(x+y\sqrt{-1})^n+(x-y\sqrt{-1})^n}{2},$$
$$\mathrm{G}_n(x,-y^2)=\frac{(x+y\sqrt{-1})^n-(x-y\sqrt{-1})^n}{2y\sqrt{-1}};$$

And, in the case of $r=1$, the formulæ obtained above are equivalent to the expressions known in analysis since the time of Dr Moivre, viz.

$$\cos.n\varphi=\frac{(\cos.\varphi+\sin.\varphi\sqrt{-1})^n+(\cos.\varphi-\sin.\varphi\sqrt{-1})^n}{2}$$
$$\sin.n\varphi=\frac{(\cos.\varphi+\sin.\varphi\sqrt{-1})^n-(\cos.\varphi-\sin.\varphi\sqrt{-1})^n}{2\sqrt{-1}}.$$

But the mode of investigation we have followed is rigorous; and it has the advantage of leading to the true import of the imaginary sign, and of putting in a clear light its real effect in analytical operations. The real use of this sign may be shortly described by saying that it performs for even and odd functions the same office that the negative sign does for ordinary functions; in other words, when, by means of the ordinary operations of analysis, it has been proved that an even or odd function of an indeterminate quantity is equal to zero, it is by means of the impossible sign that the same equation is extended to the case when the square of the indeterminate quantity is negative. Every function of the indeterminate quantity x may be thus represented, viz.

$$\varphi(x^2)\pm x\Psi(x^2);$$

and the substitution of $x\sqrt{-1}$ in place of x, has no other effect than to change the preceding expression into the one following, viz.

$$\varphi(-x^2)\pm x\sqrt{-1}\,.\,\Psi(-x^2);$$

and from this it is obvious, that the same operations which, in the one case, lead us to the equations $\varphi(x^2)=0$ and $x\Psi(x^2)=0$, will, in the other, necessarily conduct us to the equations $\varphi(-x^2)=0$ and $x\,.\,\Psi(-x^2)=0$. It is to be observed, too, that the truth of the two latter equations is involved in that of the former. For the former equations cannot be generally true for all values of x^2, unless they are identical, or consist of equal quantities with opposite signs that mutually destroy one another; in which case the latter equations will also be identical. The sign of impossibility, as it has been called, is therefore one as truly significant as any other in analysis. It has, indeed, no consistent meaning when we consider it as only affecting x, or the indeterminate quantity to which it is joined; but it becomes perfectly intelligible when we contemplate the real changes produced by it in the functions of even and odd dimensions, in which its conclusions are always ultimately expressed. When the true import and real effect of the imaginary sign are clearly apprehended, the truth of its conclusion is no longer doubtful or mysterious, but follows as a necessary consequence of a fundamental principle of analytical language. Proceeding on this principle, we may even lay aside the imaginary character; and, in every particular case, with the assistance of a proper notation, arrive, by the ordinary operations, at the same conclusion to which it leads, as has been done in the preceding instance. It is to be observed further, that the imaginary arithmetic is not merely a short method of calculation convenient in practice, and that it may be dispensed with; it is strictly a necessary branch of analysis, without which, or some equivalent mode of investigation, that science would be extremely imperfect. The equations $\varphi(x^2)=0$ and $x\Psi(x^2)=0$, are unchangeable by any operations with the signs commonly received, by the use of which alone it is impossible to deduce, in a direct manner, the related equations $\varphi(-x^2)=0$ and $x\Psi(-x^2)=0$: although the latter are equally true, of as frequent occurrence, and as extensive application, as the former. Without the impossible sign the operations of algebra would, therefore, be defective; since there are analytical truths that could not be investigated in a direct manner by means of the elementary signs usually admitted. It is to supply this defect that the imaginary arithmetic has been introduced, and has grown up to be an extensive branch of analysis; advancing at first by slow steps, because the true import of the character it employs, and the real effect of its operations, were neither clearly perceived nor fully understood. But having premised what is conducive to our present purpose, we proceed to the investigation of the trinomial divisors of rational functions.

11. Every polynome of odd dimensions having at least one binomial factor, it may, by dividing by that factor, be reduced to another polynome one degree lower. And hence, in this part of our subject, we may confine our attention to polynomes of even dimensions. We may also suppose that the even polynomes under consideration have no double, triple, &c. factors of any kind: since, in case

any such are present, they can be found separately and eliminated by division.

Suppose, then, that $f(x)$ represents any polynome of even dimensions; let $\varrho + u$ be substituted in place of x; and, by using the notation of the differential calculus, the given polynome will be transformed into

$$f(\varrho) + \frac{df(\varrho)}{d\varrho} \cdot u + \frac{1}{2} \cdot \frac{d^2f(\varrho)}{d\varrho^2} \cdot u^2 +, \&c.$$

Since $f(x)$ is an even polynome, the equation $\frac{df(x)}{dx} = 0$ will be one of odd dimensions, having at least one root. Let ϱ be the sole root of $\frac{df(x)}{dx} = 0$, when it has but one, and the greatest root when it has several; then, because $\frac{df(\varrho)}{d\varrho} = 0$, the transformed function will become

$$f(\varrho) + \frac{1}{2} \cdot \frac{d^2f(\varrho)}{d\varrho^2} u^2 + \frac{1}{6} \cdot \frac{d^3f(\varrho)}{d\varrho^3} \cdot u^3 +, \&c.$$

It readily appears, from what was formerly proved (Sect. 8), that ϱ, the greatest root of $\frac{df(x)}{dx} = 0$, exceeds the greatest root of any of the equations, $\frac{1}{2} \cdot \frac{d^2f(x)}{dx^2} = 0$, $\frac{1}{6} \cdot \frac{d^3f(x)}{dx^3} = 0$, &c.; and because, in any equation, the substitution of a value greater than the greatest root must give a positive result, all the quantities $\frac{1}{2} \cdot \frac{d^2f(\varrho)}{d\varrho^2}$, $\frac{1}{6} \cdot \frac{d^3f(\varrho)}{d\varrho^3}$, &c. will be positive. With regard to $f(\varrho)$ it may be either positive or negative, but not equal to zero; since this last case can happen only when the polynome has equal roots. The original polynome will, therefore, assume this form, viz.

$$\mp y + A^{(2)}u^2 + A^{(3)}u^3 + A^{(4)}u^4 \ldots + A^{(2n-1)}u^{2n-1}$$

$+ u^{2n}$, in which expression y, $A^{(2)}$, $A^{(3)}$, &c. represent any positive quantities.

The most interesting proposition in the branch of the subject under consideration, is to prove that every polynome of even dimensions has a quadratic divisor, either of the form $(u + \alpha)^2 - r^2$, which admits two real binomial factors, or of the form $(u - \alpha)^2 + r^2$, which has two imaginary factors. By the preceding transformation this proposition is brought under two cases, according as y is affected with the sign *minus* or *plus*; the quadratic divisor being always of the form $(u + \alpha)^2 - r^2$ in the first case, and always of the form $(u - \alpha)^2 + r^2$ in the other case; a distinction that agrees with what was before proved, Sect. 8.

Now the first of these cases is attended with no difficulty. For two values of u, one negative and one positive, may be found that will satisfy the equation, Sect. 4.

$$y = A^{(2)}u^2 + A^{(3)}u^3 + A^{(4)}u^4 \ldots + u^{2n}.$$

Of these values, it is obvious that the negative one will be always greater than the positive one; and they may, therefore, be represented by $-(r + \alpha)$ and $r - \alpha$: wherefore, the polynome

$$-y + Au^2 + A^{(3)}u^3 + A^{(4)}u^4 \ldots\ldots + u^{2n},$$

will be divisible by each of the binomial factors,

$$u + r + \alpha,$$
$$u - r + \alpha;$$

and likewise by the quadratic factor,

$$(u + \alpha)^2 - r^2,$$

produced by their multiplication.

But the same mode of reasoning will not apply when y has the sign *plus*; in which case the demonstration must be deduced from other principles.

12. If we put

$$\varphi(u) = A^{(2)}u^2 + A^{(3)}u^3 + A^{(4)}u^4 \ldots + u^{2n},$$

the transformed polynome, supposing y to have the sign *plus*, will become

$$y + \varphi(u).$$

Let $(u - \alpha)^2 + r^2$ be a quadratic divisor of this polynome, and put $u - \alpha = z$, or $u = \alpha + z$; then, by substituting $\alpha + z$ for u, and writing all the terms of the transformed function $\varphi(\alpha + z)$ in two lines, one containing all the even and the other all the odd powers of z, the polynome $y + \varphi(u)$ will be equal to

$$y + \varphi(\alpha) + \frac{1}{2} \cdot \frac{d^2\varphi(\alpha)}{d\alpha^2} \cdot z^2 + \frac{1}{24} \cdot \frac{d^4\varphi(\alpha)}{d\alpha^4} z^4 +, \&c.$$
$$+ z \cdot \left\{ \frac{d\varphi(\alpha)}{d\alpha} + \frac{1}{6} \cdot \frac{d^3\varphi(\alpha)}{d\alpha^3} \cdot z^2 +, \&c. \right\}.$$

By the same substitution of z for $u - \alpha$, the divisor $(u - \alpha)^2 + r^2$ is changed into the binomial quantity $z^2 + r^2$; which will be a divisor of each of the preceding lines, if $-r^2$, when it is substituted for z^2, render each of them equal to zero, Sect. 3. Hence we obtain the two following equations, viz.

$$0 = y + \varphi(\alpha) - \frac{1}{2} \cdot \frac{d^2\varphi(\alpha)}{d\alpha^2} r^2 + \frac{1}{24} \cdot \frac{d^4\varphi(\alpha)}{d\alpha^4} r^4 -, \&c.$$
$$0 = \frac{d\varphi(\alpha)}{d\alpha} - \frac{1}{6} \cdot \frac{d^3\varphi(\alpha)}{d\alpha^3} r^2 +, \&c. \qquad \text{(C)}$$

If two numbers, α and r^2, can be found that will satisfy these equations, it is evident that $z^2 + r^2$ will be a divisor of each of the two lines that compose the transformed function $y + \varphi(\alpha + z)$; consequently it will be a divisor of the sum of both lines, or of the function itself, that is, $(u - \alpha)^2 + r^2$ will be a divisor of the proposed polynome $y + \varphi(u)$. We are now to prove that two such numbers may be found.

Substitute $\lambda^2\alpha^2 - s$ for r^2 in the equations (C), λ being a quantity to be afterwards determined; and, in order to shorten expressions, put

$$M = \varphi(\alpha) - \frac{1}{2} \cdot \frac{d^2\varphi(\alpha)}{d\alpha^2} (\lambda^2\alpha^2 - s) + \frac{1}{24} \cdot \frac{d^4\varphi(\alpha)}{a\alpha^4} \times$$
$$(\lambda^2\alpha^2 - s)^2 - \&c.$$
$$N = \frac{d\varphi(\alpha)}{d\alpha} - \frac{1}{6} \cdot \frac{d^3\varphi(\alpha)}{d\alpha^3} (\lambda^2\alpha^2 - s) +, \&c.$$

And the two equations (C) will be thus written, viz.

$$y + M = 0,$$
$$N = 0.$$

In these equations α and s are always supposed to represent positive numbers, in which case the equation $N = 0$ cannot take place when s is greater than $\lambda^2\alpha^2$; for then all the terms of N would be positive.

Considering N as a function of α, the part of it that does not contain α is evidently

$$A^{(3)}s + A^{(5)}s^2 + A^{(7)}s^3 +, \&c.$$

which is always positive. The highest power of α contained in the same function is α^{2n-1}; and we shall obtain all the terms of N that contain this power by putting α^{2n} for $\varphi(\alpha)$ in the expression

$$\frac{d\varphi(\alpha)}{d\alpha} - \frac{1}{6} \cdot \frac{d^3\varphi(\alpha)}{d\alpha^3}\lambda^2\alpha^2 + \frac{1}{120} \cdot \frac{d^5\varphi(\alpha)}{d\alpha^5}\lambda^4\alpha^4 -, \&c.;$$

which terms are therefore as follows, viz.

$$\alpha^{2n-1} \left\{ 2n - 2n.\frac{2n-1 \,.\, 2n-2}{2 \;.\; 3} \lambda^2 + \right.$$

Equations.

$$2n.\frac{2n-1\,.\,2n-2\,.\,2n-3\,.\,2n-4}{2\quad.\quad3\quad.\quad4\quad.\quad5}\lambda^4+,\&c.\Big\}.$$

Now, in the expression obtained in Sect. 10, viz.

$$r^{2n-1}\times\frac{\sin.2n\varphi}{\sin.\varphi}=2nx^{2n-1}-2n.\frac{2n-1\,.\,2n-2}{2\quad.\quad3}x^{2n-3}y^2+,\&c.$$

if we put $\lambda^2=\frac{y^2}{x^2}=\tan.^2\varphi$, and divide both sides by $x^{2n-1}=r^{2n-1}\cos.^{2n-1}\varphi$; we shall obtain

$$\frac{\sin.2n\varphi}{\sin.\varphi}\times\frac{1}{\cos.^{2n-1}\varphi}=2n-2n\cdot\frac{2n-1\,.\,2n-2}{2\quad.\quad3}\lambda^2+,\&c.;$$

from which formula it follows, that the polynome on the right-hand side of the sign of equality will be equal to nothing, where $\varphi=\pm\frac{m}{n}\times90°$, m being any integer number less than n, zero not included. Wherefore the first, third, &c. roots of the polynome will be expressed by the formula

$$\lambda^2=\tan.^2\frac{2k+1}{n}\cdot90,$$

$2k+1$ representing any odd number less than n; and the second, fourth, &c. roots by the formula

$$\lambda^2=\tan.^2\frac{2k+2}{n}\cdot90°,$$

$2k+2$ being any even number less than n. And it is evident that the polynome will be negative for every value of λ^2 that lies between any odd root and the next even root, that is, for every value between these limits, viz.

$$\lambda^2>\tan.^2\frac{2k+1}{n}\cdot90°,$$

$$\lambda^2<\tan.^2\frac{2k+2}{n}\cdot90°.$$

Thus, an indefinite number of values of λ^2 may be found that will make the polynome negative.

Having assumed such a value of λ^2, let any positive number whatever be substituted for s, and N will be converted into a rational function of α; the greatest power of α, or α^{2n-1}, being odd, and having a negative co-efficient; and the term which does not contain α being positive. Wherefore at least one positive value of α may be found that will satisfy the equation $N=0$; and, as has already been observed, this value of α will be such as to make $\lambda^2\alpha^2-s$ a positive quantity. It is possible indeed that, in the equation $N=0$, there may be several values of α for every assumed value of s; but we here confine our attention to the least positive value, which is distinguished by this circumstance, that it vanishes with the absolute term of the equation, or with s; whereas, when s is equal to zero, all the other roots of the equation $N=0$ have finite values depending upon the given co-efficients.

Now, if we suppose s to increase from zero to infinity, and assume two values, s, and $s+\delta s$, very near one another, according to what has been proved, we shall have the corresponding values α and $\alpha+\delta\alpha$, such, that the equation $N=0$ will be satisfied by substituting both s and α, and likewise $s+\delta s$ and $\alpha+\delta\alpha$. Hence, because $N=0$, and $\delta N=0$, we get

$$\frac{dN}{d\alpha}.\delta\alpha+\frac{dN}{ds}.\delta s=0,$$

$$\text{and, }\delta\alpha=-\frac{\delta s}{\left(\frac{dN}{d\alpha}\right)}\times\frac{dN}{ds}.$$

Again, if we substitute first s and α, and then $s+\delta s$ and $\alpha+\delta\alpha$, in the function M, we shall get

Equations.

$$\delta M=\frac{dM}{d\alpha}.\delta\alpha+\frac{dM}{ds}.\delta s.$$

But, by comparing the functions M and N, the following properties will readily be discovered, viz.

$$\frac{dM}{d\alpha}+2\lambda^2\alpha.\frac{dM}{ds}=N-2\frac{dN}{ds}(\lambda^2\alpha^2-s),$$

$$\frac{dM}{ds}=\frac{1}{2}\cdot\frac{dN}{d\alpha}+\lambda^2\alpha\cdot\frac{dN}{ds}:$$

whence,

$$\frac{dM}{d\alpha}=N-2\frac{dN}{ds}(\lambda^2\alpha^2-s)-\frac{dN}{d\alpha}\lambda^2\alpha-2\lambda^4\alpha^2\frac{dN}{ds}.$$

Consequently,

$$\delta M=\left\{N-2\frac{dN}{ds}(\lambda^2\alpha^2-s)-\frac{dN}{d\alpha}\lambda^2\alpha-2\lambda^4\alpha^2\cdot\frac{dN}{ds}\right\}\times\delta\alpha+\left\{\frac{1}{2}\cdot\frac{dN}{d\alpha}+\lambda^2\alpha\cdot\frac{dN}{ds}\right\}\cdot\delta s:$$

and, if we observe that $N=0$, and substitute the value of $\delta\alpha$ found above, we shall get

$$\delta M=\frac{-\delta s}{\left(\frac{dN}{d\alpha}\right)}.-\left\{2\left(\frac{dN}{ds}\right)^2(\lambda^2\alpha^2-s)+\frac{1}{2}\left(\frac{dN}{d\alpha}+2\lambda^2\alpha\frac{dN}{ds}\right)^2\right\},$$

in which expression all the quantities are essentially positive, except $\frac{dN}{d\alpha}$, which is always negative, as may be thus proved.

The quantity s remaining invariable, if we make $\alpha=0$, the function N will be positive; for it is equal to

$$A^{(3)}s+A^{(5)}s^2+A^{(7)}s^3+,\&c.;$$

and the same function will continue positive, while α increases from zero to the least root of the equation $N=0$. At this limit N is first equal to zero, and then becomes negative; it must, therefore, be decreasing, and consequently $\frac{dN}{d\alpha}$ is negative. It mav indeed happen, that, for particular values of s, the co-efficients of N may be such, that N and $\frac{dN}{d\alpha}$ shall be both equal to zero at the same time; but, in such cases, it will readily appear that $\frac{dN}{ds}$ and δM will likewise be equal to zero. Wherefore δM will be negative; at least, if it become equal to zero for any particular values of s and α, it cannot become positive. It follows, therefore, that the function M itself will be invariably negative, while s and α increase together from zero to be infinitely great.

Now assume a series of values of s increasing from zero without limit, viz.

$$0,s^{(1)},s^{(2)},s^{(3)},\ldots\ldots s^{(x)},s^{(x+1)}\ldots.$$

and having substituted these in the function N, find, by means of the equation $N=0$, the corresponding values of α, viz.

$$0,\alpha^{(1)},\alpha^{(2)},\alpha^{(3)},\ldots\ldots\alpha^{(x)},\alpha^{(x+1)}\ldots$$

then, by substituting these values in M, we shall obtain a series of results all negative, and increasing from zero without limit, viz.

$$0,-M^{(1)},-M^{(2)},-M^{(3)}..-M^{(x)},-M^{(x+1)}..$$

 and whatever be the magnitude of the positive quantity y, it must be contained between two consecutive terms of this last series, viz. between $M^{(x)}$ and $M^{(x+1)}$. But as the values of s may be assumed as near one another as we please, it follows that $M^{(x)}$ and $M^{(x+1)}$ may be made to approach to one another and to y, within any required degree of accuracy. Thus two values of s and α may be found that will satisfy both the equations,

$$y + M = 0,$$
$$N = 0;$$

and having found these values, we shall obtain the quadratic divisor of the proposed polynome $y + \varphi(u)$, viz. $(u-\alpha)^2 + r^2$, or

$$(u-\alpha)^2 + \lambda^2\alpha^2 - s.$$

In the preceding demonstration it is supposed that M increases without limit, as s becomes indefinitely great; which may be thus proved: The values of M and N will coincide nearly with the terms containing the highest powers of s and α, when these quantities are very great; and ultimately the functions may be considered as equal to those terms alone. In such circumstances, therefore, the values of the functions will be found by writing α^{2n} for $\varphi(\alpha)$; whence we get

$$M = \alpha^{2n} - 2n.\frac{2n-1}{2}.\alpha^{2n-2}(\lambda^2\alpha^2 - s) +, \&c.$$

$$N = 2n\,\alpha^{2n-1} - 2n.\frac{2n-1\cdot 2n-2}{2\ .\ 3}(\lambda^2\alpha^2 - s) +, \&c.$$

and if we put $\lambda^2\alpha^2 - s = t^2\alpha^2$, or $\alpha^2 = \frac{s}{\lambda^2 - t^2}$,

then $M = \alpha^{2n}\left\{1 - 2n.\frac{2n-1}{2}.t^2 +, \&c.\right\}$

$$N = \alpha^{2n-1}\left\{2n - 2n.\frac{2n-1\cdot 2n-2}{2\ \cdot\ 3}.t^2 +, \&c.\right\}$$

Now, s remaining invariable, α will increase as t^2 increases; and the least value of α that will satisfy the equation $N = 0$, corresponds to the least value of t^2 that will make the polynome in the expression of N equal to zero; which value, according to what was before shown, is

$$t^2 = \tan.^2 \frac{1}{n} \times 90°.$$

But, if we put $t = \tan.\ \varphi$, we shall get

$$M = \alpha^{2n} \times \frac{\cos.\ 2n\varphi}{\cos.^{2n}\varphi};$$

or, because $\varphi = \frac{1}{n} \times 90°$; $\cos.\ \varphi = \frac{1}{\sqrt{1+t^2}}$,

and $\alpha^2 = \frac{s}{\lambda^2 - t^2}$;

$$M = -s^n \times \left(\frac{1+t^2}{\lambda^2 - t^2}\right)^n;$$

which proves the point assumed in the demonstration.

By a similar mode of reasoning, we may likewise prove the former case of the proposition, when y is negative. In this case the quadratic divisor is $(u-\alpha)^2 - r^2$; and if we proceed as before, or, which is the same thing, if we change the signs of y and r^2 in the equations (C) already obtained, and put

$$M = \varphi(\alpha) + \frac{1}{2}\cdot\frac{d^2\varphi(\alpha)}{d\alpha^2}\cdot r^2 +, \&c.$$

$$N = \frac{d\varphi(\alpha)}{d\alpha} + \frac{1}{6}\cdot\frac{d^3\varphi(\alpha)}{d\alpha^3}r^2 +, \&c.;$$

we shall get

$$-y + M = 0,$$
$$N = 0.$$

Now, by pursuing the steps of the foregoing analysis, we may prove, first, that, for every assumed value of r^2, a negative value of α may be found, which will satisfy the equation $N = 0$; and, secondly, that when the values which satisfy the equation $N = 0$ are substituted in the function M, the results will be invariably positive; whence it follows that a positive value of r^2, and a negative value of α, may be found that will satisfy both the equations, whatever be the magnitude of y. The analogy between the two cases is thus placed in a strong light; and a little reflection will even bring us to this conclusion, that in reality the one case is a necessary consequence of the other. For since α and r^2 depend only upon y, and the given co-efficients of the polynome, they will be functions of y; wherefore, in the equations of the first case, viz.

$$-y + M = 0,$$
$$N = 0,$$

α being negative, and r^2 positive, we may suppose $-\alpha = y\varphi(y)$ and $r^2 = y\Psi(y)$, these values being such as to render each of the equations identical; and then the quadratic divisor $(u-\alpha)^2 - r^2$ will become

$$\left\{u + y\,\varphi(y)\right\}^2 - y\Psi(y).$$

But, because the foregoing equations become identical by the substitution of the values mentioned, it is a necessary consequence that the equations of the second case, viz.

$$y + M = 0,$$
$$N = 0,$$

in which the signs of y, α, and r^2, are contrary to what they were in the former equations, will likewise be identical, when $-\alpha = -y\varphi(-y)$ and $r^2 = -y\Psi(-y)$; and the quadratic divisor, $(u-\alpha)^2 - r^2$, will now become

$$\left\{u - y\varphi(-y)\right\}^2 + y\Psi(-y).$$

Thus, when the quadratic divisor of the first case is expressed in terms of y, we have only to change the sign of that quantity, in order to have the quadratic divisor of the second case. It is not difficult to perceive, that what has now been proved is nothing more than another application of the principle employed in Sect. 10; a principle which is the real foundation of the imaginary arithmetic, with the processes of which the preceding investigations are intimately connected. None but real quantities have occurred in the analysis we have pursued, because we have sought to investigate r^2, which is always rational; whereas, if we had proposed to find r, we should inevitably have been led to the real quantity $\sqrt{y}$ in the one case, and to the impossible quantity $\sqrt{-y}$ in the other. These few observations are made for the purpose of throwing light upon a part of analysis which is certainly obscure in its principles, although there is no question that it is a useful, and even a necessary branch of the art of calculation. A fuller elucidation of the subject would be unsuitable to this place; but enough has been said to show that we must seek in the principles of analysis itself for the explanation of the operations it employs; and we may with great probability conclude that no satisfactory account of the imaginary calculus will ever be obtained by having recourse to fanciful geometrical constructions, or to the analogy between the circle and the hyperbola, or to the metaphysical proposition, that all processes with general symbols, whether signifi-

cant or not, are equally entitled to be considered as demonstrative.

13. Having now proved, in a rigorous manner, that every polynome of even dimensions has at least one quadratic divisor of the one kind or the other, it follows that it may be reduced by division to another polynome two degrees lower: in like manner, this last polynome will admit of being lowered two degrees more; and by repeating the same process, the first polynome will at length be completely exhausted by quadratic divisors. If, therefore, we recollect, that every polynome of odd dimensions has one binomial divisor, we shall arrive at this general conclusion, "That every rational polynome can be completely exhausted by binomial and trinomial divisors; and, consequently, that it is equal to the product of a certain number of factors of the two first degrees."

It appears also that the binomial factors of any polynome are such only as arise from the resolution of the quadratic divisors; and they are, therefore, either real or imaginary. And thus we finally obtain the following proposition, which was assumed by Harriot, and is the foundation of the received theory of equations, namely, "Every rational polynome has as many binominal factors, and as many roots, real and imaginary, as it has dimensions."

The necessity of confirming, by a general demonstration, the assumed theory of the impossible roots of equations, was early felt; and accordingly, this point has engaged the attention of all the great mathematicians to whom analysis is indebted for the progress it has made in the course of the last and the present centuries. An account of their several researches would greatly exceed the limits of this article; but the reader will find all the information he can wish for in two long notes (9 and 10) of the *Traité des Equations Numeriques*, by La Grange, in which the author, with his usual elegance, has explained and commented upon the various modes of investigation that have been proposed. It will be sufficient to observe here, that all the demonstrations that have appeared are either calculations with impossible quantities, or they proceed upon the assumption that every equation has as many roots as dimensions, and thus involve the very thing to be proved.

14. The general cases in which mathematicians have been successful in resolving rational functions into their trinomial factors, are confined to the theorem of Cotes, and to a more general proposition of a similar kind, for which we are indebted to De Moivre. These instances are of great importance in analysis, and we shall therefore subjoin an investigation of them, because they are deduced in a very direct manner from the method we have followed.

Suppose, as before, that $f(x)$, or $x^n + A^{(1)}x^{n-1} + A^{(2)}x^{n-2} \ldots + A^{(n-1)}x + A^{(n)}$, is a rational polynome of n dimensions, and $(x-\alpha)^2 + \tau^2$ one of its quadratic divisors; put $z = x - \alpha$, substitute $\alpha + z$ for x, and write the transformed function in two lines, one containing all the even, and the other all the odd powers of z; then the polynome will be equal to

$$f(\alpha) + \frac{1}{2}\cdot\frac{d^2f(\alpha)}{d\alpha^2}z^2 + \frac{1}{24}\cdot\frac{d^4f(\alpha)}{d\alpha^4}z^4 -, \text{ \&c.}$$

$$+ z \times \left\{\frac{df(\alpha)}{d\alpha} + \frac{1}{6}\ \frac{d^3f(\alpha)}{d\alpha^3}z^2 + \frac{1}{120}\cdot\frac{d^5f(\alpha)}{d\alpha^5}z^4, \text{ \&c.}\right\}$$

By the same substitution of z for $x - \alpha$, the divisor $(x-\alpha)^2 + \tau^2$ will become $z^2 + \tau^2$; and, as before, the conditions that $z^2 + \tau^2$ shall divide each of the foregoing lines, will be expressed by the following equations, viz.

$$0 = f(\alpha) - \frac{1}{2}\cdot\frac{d^2f(\alpha)}{d\alpha^2}\tau^2 + \frac{1}{24}\cdot\frac{d^4f(\alpha)}{d\alpha^4}\tau^4 -, \text{ \&c.} \quad \text{(D)}$$

$$0 = \frac{df(\alpha)}{d\alpha} - \frac{1}{6}\cdot\frac{d^3f(\alpha)}{d\alpha^3}\tau^2 + \frac{1}{120}\cdot\frac{d^5f(\alpha)}{d\alpha^5}\tau^4 -, \text{ \&c.}$$

In these formulæ substitute the expanded values of $f(\alpha)$, $\frac{df(\alpha)}{d\alpha}$, &c.; and class together all the homogeneous terms of the same order, that is, all the terms in which the exponents of α and τ amount to the same sum, then we shall have

$$0 = \alpha_n - n.\frac{n-1}{2}\alpha^{n-2}\tau^2 +, \text{ \&c.}$$

$$+ A^{(1)}.\left\{\alpha^{n-1} - n-1.\frac{n-2}{2}.\alpha^{n-3}\tau^2 +, \text{ \&c.}\right\}$$

$$+ A^{(2)}.\left\{\alpha^{n-2} - n-2.\frac{n-3}{2}\alpha^{n-4}\tau^2 +, \text{ \&c.}\right\}$$

&c.

$$0 = n\alpha^{n-1} - n.\frac{n-1.n-2}{2\ .\ 3}\alpha^{n-3}\tau^2 +, \text{ \&c.}$$

$$+ A^{(1)}.\left\{(n-1)\alpha^{n-2} - n-1.\frac{n-2.n-3}{2\ .\ 3}\alpha^{n-4}\tau^2 +, \text{ \&c.}\right\}$$

$$+ A^{(2)}.\left\{(n-2)\alpha^{n-3} - n-2.\frac{n-3.n-4}{2\ .\ 3}\alpha^{n-5}\tau^2 +, \text{ \&c.}\right\}$$

&c.

Now, put $\alpha = r\cos.\varphi$, $\tau = r\sin.\varphi$; and, by what was proved in Sect. 10, the two foregoing equations will become

$$r^n\cos.n\varphi + A^{(1)}r^{n-1}\cos.(n-1)\varphi \ldots\ldots + A^{(n-1)}r\cos.\varphi + A^{(n)} = 0, \quad \text{(E)}$$

$$\frac{1}{\sin.\varphi}.\left\{r^{n-1}\sin.n\varphi + A^{(1)}r^{n-2}\sin.(n-1)\varphi \ldots\ldots + A^{(n-)}\sin.\varphi\right\} = 0:$$

And the quadratic divisor $(x-\alpha)^2 + \tau^2$ will be changed into

$$x^2 - 2r\cos.\varphi.x + r^2.$$

When $\sin.\varphi = 0$, and $\varphi = 0$ or 180°, the preceding equations coincide with these, viz.

$$r^n \pm A^{(1)}r^{n-1} + A^{(2)}r^{n-2} \pm, \text{ \&c.} = 0,$$

$$nr^{n-1} \pm (n-1)A^{(1)}r^{n-2} + (n-2)A^{(2)}r^{n-3} \pm, \text{ \&c.} = 0,$$

which express the condition that the given polynome has two or more factors equal to $x \mp r$; at which limits a quadratic divisor changes from being of the form $(x-\alpha)^2 - \tau^2$ to be of the form $(x-\alpha)^2 + \tau^2$, or the contrary. Thus we learn that, in the equations (E), $\sin.\varphi$ must always have a finite value, and then the denominator of the second equation may be neglected.

Let the preceding investigation be applied to find the quadratic factors of $x^n - \alpha^n$. In this case the two equations (E) will become

$$r^n\cos.n\varphi - \alpha^n = 0,$$

$$r^{n-1} \times \frac{\sin. n\varphi}{\sin. \varphi} = 0;$$

whence

$$r = a,$$
$$\cos. n\varphi = 1,$$
$$\frac{\sin. n\varphi}{\sin. \varphi} = 0.$$

Now, excluding the cases when $\varphi = 0$ and $\varphi = 180°$, the last equation will be satisfied when $\varphi = \frac{2k+1}{n} \times 180°$, or $\varphi = \frac{2k}{n} \times 180°$, the numerators of the fractions representing all the odd and even numbers less than the common denominator; but the second equation will be satisfied only when $\varphi = \frac{2k}{n} \times 180°$; wherefore all the quadratic factors of the function $x^n - a^n$ will be comprehended in the formula

$$x^2 - 2ax \times \cos. \frac{2k}{n} \times 180° + a^2.$$

When n is an even number, the quadratic factors will amount to $\frac{n-2}{2}$; and if to them we add the simple factors $x + a$ and $x - a$, we shall have the complete resolution of the function. When n is odd, the number of quadratic factors is $\frac{n-1}{2}$, to which must be added the binomial factor $x - a$.

By proceeding in a similar manner in the case of the function $x^n + a^n$, we shall have the equations

$$r = a,$$
$$\cos. n\varphi = -1,$$
$$\frac{\sin. n\varphi}{\sin. \varphi} = 0.$$

Excluding the cases when $\varphi = 0$ and $\varphi = 180°$, the second and third equations will be both satisfied, when $\varphi = \frac{2k+1}{n} \times 180°$, the numerator of the fraction representing any odd number less than n. Wherefore all the quadratic factors will be comprehended in the formula

$$x^2 - 2ax \times \cos. \frac{2k+1}{n} \times 180° + a^2.$$

When n is even, the number of quadratic factors is $\frac{n}{2}$, and they exhibit the complete resolution of the function. When n is odd, the number of quadratic factors is $\frac{n-1}{2}$, to which the binomial factor $x + a$ must be added.

Let us next take the more general function.

$$x^{2n} - 2\beta x^n a^n + a^{2n}.$$

And, in the first place, when β is greater than unit, the function is equal to

$$\left\{x^n - a^n(\beta + \sqrt{\beta^2 - 1})\right\} \times \left\{x^n - a^n(\beta - \sqrt{\beta^2 - 1})\right\};$$

and the quadratic factors may be found by the cases already considered.

When β is less than unit, let $\beta = \cos. \theta$, and the function to be resolved will be

$$x^{2n} - 2a^n x^n \cos. \theta + a^{2n}.$$

By means of the equations (E) we get

$$r^{2n} \cos. 2n\varphi - 2a^n r^n \cos. \theta \cos. n\varphi + a^{2n} = 0,$$
$$r^{2n-1} \times \frac{\sin. 2n\varphi}{\sin. \varphi} - 2a^n r^{n-1} \times \frac{\sin. n\varphi}{\sin. \varphi} \times \cos. \theta = 0;$$

and hence

$$r = a,$$
$$\cos. 2n\varphi - 2\cos. \theta \cos. n\varphi + 1 = 0,$$
$$\frac{\sin. 2n\varphi}{\sin. \varphi} - 2\frac{\sin. n\varphi}{\sin. \varphi} \times \cos. \theta = 0.$$

But, $\cos. 2n\varphi + 1 = 2\cos.^2 n\varphi$; and $\sin. 2n\varphi = 2\cos. n\varphi \times \sin. n\varphi$; wherefore the two last equations will become

$$2\cos. n\varphi\,(\cos. n\varphi - \cos. \theta) = 0,$$
$$2\frac{\sin. n\varphi}{\sin. \varphi}(\cos. n\varphi - \cos. \theta) = 0:$$

and these, supposing $\cos. \theta$ different from unit, can be satisfied only by making $\cos. n\varphi - \cos. \theta = 0$, or

$$\cos. n\varphi = \cos. \theta.$$

Now, $\cos. \theta = \cos. (m \times 360° + \theta)$, m being any integer number whatever, zero included; and hence $\varphi = \frac{m \times 360° + \theta}{n}$, which formula comprehends all the values of θ that will satisfy the above equations. Wherefore all the factors sought will be contained in this general expression, viz.

$$x^2 - 2ax \cos. \frac{m \times 360° + \theta}{n} + a^2;$$

in which, if for m we substitute all the integer numbers less than n, zero included, we shall obtain the n quadratic factors of the proposed function.

15. The quadratic divisors $(x - \alpha)^2 - r^2$ and $(x - \alpha)^2 + r^2$, have hitherto been considered separately; but they may be both represented by $(x - \alpha)^2 - s$, which will coincide with the one or the other, according as s is positive or negative. And, if we now proceed as before, we shall get the following equations, which express the conditions necessary, in order that the polynome $f(x)$ of any proposed dimensions, as n, shall be divisible by $(x - \alpha)^2 - s$, viz.

$$0 = f(\alpha) + \frac{1}{2} \cdot \frac{d^2 f(\alpha)}{d\alpha^2} s + \frac{1}{24} \cdot \frac{d^4 f(\alpha)}{d\alpha^4} \cdot s^2 +, \&c.$$
$$0 = \frac{df(\alpha)}{d\alpha} + \frac{1}{6} \cdot \frac{d^3 f(\alpha)}{d\alpha^3} \cdot s + \frac{1}{120} \cdot \frac{d^5 f(\alpha)}{d\alpha^5} s^2 +, \&c.$$

By eliminating s we shall obtain an equation, viz.

$$A = 0,$$

in which α is the unknown quantity. As the process of elimination is independent of the particular values of the co-efficients of $f(x)$, the degree of the resulting equation will be the same when the polynome $f(x)$ has as many real roots as dimensions, and when the case is otherwise. But when $f(x)$ is equal to the product of n real binomial factors, the multiplication of every two of them will form a quadratic factor. The number of such factors will, therefore, be equal to $n \times \frac{n-1}{2}$, which expresses all the combinations made with n things taken two and two. Consequently, there will be just so many different values of α that will satisfy the equation $A = 0$, which will, therefore, have its exponent equal to $n \times \frac{n-1}{2}$. It thus appears that the equation $A = 0$ rises in its dimensions very rapidly above the given polynome, on which account little advantage is derived from this procedure.

Again, by eliminating α from the same two equations, we shall obtain one, viz.

$$S = 0,$$

in which s is the unknown quantity. This equation, which has already been alluded to (Sect. 8), rises to the same dimensions with the former equation, $A = 0$; but it is possessed of some useful properties, derived chiefly from the consideration that every positive root gives a quadratic factor of the form $(x - \alpha)^2 - r^2$ in the polynome $f(x)$, and every negative root a quadratic factor of the form $(x - \alpha)^2 + r^2$ in the same polynome.

The quadruple of s is equal to the square of the difference of the two binomial factors of $(x - \alpha)^2 - s$; whence it follows that the quadruples of the several roots of the equation $S = 0$ are equal to the squares of the differences of the roots of $f(x) = 0$. If, therefore, we put x', x'', x''', &c. for the roots of $f(x) = 0$, the roots of $S = 0$ will be

$$\frac{1}{4}(x' - x'')^2,\ \frac{1}{4}(x' - x''')^2,\ \frac{1}{4}(x'' - x''')^2,\ \&c.;$$

and from this it is manifest that the co-efficients of the same equation will be known symmetrical functions of the quantities x', x'', x''', &c. or of the roots of $f(x) = 0$. The rules formerly explained may, therefore, be employed for calculating the co-efficients of $S = 0$; and this method of forming the equation is not only more convenient than the process of eliminating, but it likewise has the advantage of enabling us to find any one co-efficient separately without computing the rest. Thus, if we put

$$K^{(n)} = (x' - x'')^2 \cdot (x' - x''')^2 \cdot (x'' - x''')^2 \cdot \&c.$$

and expand this product, and in place of the symmetrical functions of which it is composed, substitute their values in terms of the given co-efficients of $f(x) = 0$, we shall obtain the value of $K^{(n)}$; and the last term of the equation $S = 0$ will be equal to

$$\pm \frac{K^{(n)}}{2^{n(n-1)}}$$

the upper sign taking place when $n \times \frac{n-1}{2}$, the dimensions of the equation $S = 0$ is even, and the lower sign when the same number is odd.

If we suppose the given equation $f(x) = 0$ to be possessed of as many real roots as dimensions, or to have n real binomial factors, the product of every two of these will be a quadratic factor $(x - \alpha)^2 - s$, in which s is positive; wherefore, the roots of $S = 0$ will be all real and all positive. On the other hand, when the given equation $f(x) = 0$ has not as many real roots as dimensions, it will be divisible by one or more quadratic factors not resolvable into real binomial factors, and in which s is negative; consequently, the equation $S = 0$ will have one or more negative roots. It is, therefore, a property of the auxiliary equation $S = 0$, that when the roots are all real they are all positive, and when they are not all real some of them are negative. Now the rule of Descartes will enable us to find whether the roots are all positive or not; and by this means we shall discover whether the roots of the given equation $f(x) = 0$ are all real or not. From what has been said, we may lay down this rule: "The proposed equation $f(x) = 0$ will have all its roots real when the auxiliary equation $S = 0$ has as many variations from one sign to another as it has dimensions, or when its terms are alternately positive and negative; otherwise the proposed equation will have one or more quadratic factors of the form $(x - \alpha)^2 + r^2$, but the number of such factors cannot exceed the continuations of the same sign in the auxiliary equation."

Again, in the equation $S = 0$, the polynome S is equal to a certain number of binomial factors or the forms $x - a$ and $x + a$, multiplied into a supplementary polynome of even dimensions, which, not being capable of having a negative value, will have its last term positive (Sect. 5). It is manifest, therefore, that the last term of $S = 0$ will be positive or negative, according as the number of factors of the form $x - a$ is even or odd, that is, according as the equation has an even or odd number of real and positive roots. But every two real roots in the equation $f(x) = 0$ give one real and positive root in the subsidiary equation $S = 0$; wherefore, if m denote the number of real roots in the former equation, the number of real and positive roots in the latter will be equal to $m \times \frac{m-1}{2}$; and the last term of the subsidiary equation will be positive or negative, according as $m \times \frac{m-1}{2}$ is an even or an odd number.

In a cubic equation $x^3 + px + q = 0$, m is either one or three. In the first case, the equation $S = 0$ will have no positive roots, and the last term will be positive; in the second case, it will have three real and positive roots, and the last term will be negative. Now the dimensions of $S = 0$ being odd, the function $K^{(3)}$ will be negative in the first case and positive in the second. Wherefore the given cubic equation will have one real root, or three, according as the function $K^{(3)}$, that is,

$$(x' - x'')^2 \cdot (x' - x''')^2 \cdot (x'' - x''')^2,$$

or $-4p^3 - 27q^2$, is negative or positive.

In a biquadratic equation $x^4 + px^2 + qx + r = 0$, m is equal to zero, or two, or four. In the first case the equation $S = 0$ has no positive roots, in the third it has six, and in both cases the last term is positive. In the second case the same equation has only one real and positive root, and the last term is negative. The dimensions of $S = 0$, equal to $\frac{4 \times 3}{2}$, being even, the function $K^{(4)}$ will be positive in the first and third cases, and negative in the second case. Wherefore the proposed biquadratic equation will have only two real roots when the function $K^{(4)}$, that is,
$(x' - x'')^2 . (x' - x''')^2 . (x' - x^{IV})^2 . (x'' - x''')^2 . (x - x^{IV})^2 . (x''' - x^{IV})^2$, or, $256r^3 - 128p^2r^2 + 144q^2pr + 16p^4r - 27q^4 - 4q^2p^3$, is negative; and when the same function is positive, the proposed equation will have four real roots, if the terms of the auxiliary equation $S = 0$ be alternately positive and negative; otherwise it will have no real roots.

In an equation of the fifth degree, m is equal to one, or three, or five. In the first and third cases the last term of $S = 0$ will be positive, for there are either no positive roots or ten; in the second case the last term is negative, the number of positive roots being three. The dimensions of $S = 0$, equal to $\frac{5 \times 4}{2}$, being even, the function $K^{(5)}$ will be positive in the first and third cases, and negative in the second. Wherefore the given equation of the fifth degree will have three real roots when the function $K^{(5)}$ is negative; and when the same function is positive, it will have five real roots if the terms of the auxiliary equation $S = 0$ be alternately positive and negative; otherwise it will have but one.

Resolution of Algebraic Equations.

16. When the co-efficients of an equation are given in

numbers, we may investigate the numerical value of any one root separately, by first seeking the limits between which it lies, and then narrowing those limits to any required degree of approximation. But this process is not what is meant by the general solution of algebraical equations, which supposes that the co-efficients are denoted by general symbols, and consists in finding such a function of those quantities as shall, by the multiplicity of its values, represent all the roots. An algebraical expression is susceptible of many values, by means of the different radical quantities it contains; but these radical quantities being themselves the roots of an equation, it follows that the general formula for the solution of any proposed equation can be nothing more than a function of the given co-efficients combined with the roots of another equation.

The solution of quadratic equations has been known since the origin of algebra; it is found in the work of Diophantus, the first treatise on the science extant, if it be not the very first that was written. The Italian mathematicians, who are the founders of the modern algebra, discovered the solution of cubic and biquadratic equations. The rules they invented for this purpose are, however, rather the result of particular artifices than deductions from any profound views of the structure of the equations they considered. In the course of the last and the present centuries, the general solution of equations has been the subject of almost innumerable researches by all the mathematicians of the first rank; but their labours have not been successful in advancing this branch of the science beyond the steps made by the first algebraists.

The rules usually given for the solution of cubic and biquadratic equations are to be found in all the elementary books, and it would be superfluous to repeat them here. An account of the attempts that have been made to obtain a general theory for solving algebraic equations would greatly exceed the limits we must prescribe to ourselves. What has most impeded the progress of algebraists in their researches on this subject, is the difficulty of treating it by a perfect analysis, or of arriving at general conclusions by a process of reasoning founded solely on the principles of the inquiry, and disengaged from particular artifices of calculation, and from particular suppositions. In what follows we shall endeavour to lay before our readers the general principles on which is founded all that has been successfully accomplished in this theory.

Resolution of cubic equations.

Let the three roots of a cubic equation be represented by a, b, c; and having interchanged these letters among one another in all possible ways, we shall get the six permutations following, viz.—

$$abc,\quad cab,\quad bca.$$
$$acb,\quad bac,\quad cba.$$

The combinations that stand first on the left are formed by prefixing the same letter to the permutations made with the other two; and those on each line are derived from one another by making the last letter of one stand first in that which follows, while the other two letters preserve the same order.

Now let $\varrho^3 - 1 = 0$; and let the letters of first combination of each line be prefixed in order to the three terms of $1 + \varrho + \varrho^2$; then we shall get

$$t = a + b\varrho + c\varrho^2, \qquad s = a + c\varrho + b\varrho^2;$$

and if we multiply t and s by $1, \varrho, \varrho^2$ successively, we shall further obtain

$$t = a + b\varrho + c\varrho^2, \qquad s = a + c\varrho + b\varrho^2,$$
$$t\varrho = c + a\varrho + b\varrho^2, \qquad s\varrho = b + a\varrho + c\varrho^2,$$
$$t\varrho^2 = b + c\varrho + a\varrho^2. \qquad s\varrho^2 = c + b\varrho + a\varrho^2.$$

The six quantities $t, t\varrho, t\varrho^2, s, s\varrho, s\varrho^2$, comprehend all the values that can be formed by combining with $1 + \varrho + \varrho^2$, the three letters taken in any order whatever; and it is obvious that the cubes of all these six quantities, being each equal either to t^3 or s^3, have no more than two values.

And because t^3 and s^3 have only one value each, any symmetrical functions of them, as $t^3 + s^3$ and $t^3 s^3$, will have determinate values, which remain the same, however the letters a, b, c be interchanged among one another. The quantities $t^3 + s^3$ and $t^3 s^3$ must, therefore, be symmetrical functions of a, b, c; and, consequently, they can be found in terms of the co-efficients of the given equation.

By actually involving to the third power, we get

$$\begin{aligned} t^3 = a^3 + b^3 + c^3 &+ 6\,abc \\ &+ 3\,(a^2b + b^2c + c^2a)\,.\,\varrho \\ &+ 3\,(a^2c + c^2b + b^2a)\cdot\varrho^2, \\ s^3 = a^3 + b^3 + c^3 &+ 6\,abc \\ &+ 3\,(a^2c + c^2b + b^2a)\,.\,\varrho \\ &+ 3\,(a^2b + b^2c + c^2a)\,.\,\varrho^2. \end{aligned}$$

and likewise

$$\begin{aligned} (a + b + c)^3 = a^3 + b^3 + c^3 &+ 6\,abc \\ &+ 3\,(a^2b + b^2c + c^2a) \\ &+ 3\,(a^2c + c^2b + b^2a). \end{aligned}$$

Now $1 + \varrho + \varrho^2 = 0$, when ϱ is any root of $\varrho^3 - 1 = 0$ different from unit; therefore, by adding the last three expressions, we get

$$t^3 + s^3 = 3\,(a^3 + b^3 + c^3) + 18\,abc - (a + b + c)^3.$$

Again, by actually multiplying

$$\begin{aligned} ts = a^2 + b^2 &+ c^2 \\ &+ (ab + bc + ca)\,.\,\varrho \\ &+ (ab + bc + ca)\,.\,\varrho^2; \end{aligned}$$

and, because $\varrho + \varrho^2 = -1$,

$$ts = a^2 + b^2 + c^2 - (ab + bc + ca).$$

By means of the preceding formulæ, we can compute the values of $t^3 + s^3$ and $t^3 s^3$; and these values being the co-efficients of a quadratic equation having its roots equal to t^3 and s^3, we can thence find t^3 and s^3, and t and s. Now t and s being known, we have

$$a + b + c = a + b + c,$$
$$t = a + b\varrho + c\varrho^2,$$
$$s = a + c\varrho + b\varrho^2;$$

wherefore,

$$a = \frac{1}{3}(a + b + c) + \frac{1}{3}(t + s),$$

$$b = \frac{1}{3}(a + b + c) + \frac{1}{3}(t\varrho^2 + s\varrho),$$

$$c = \frac{1}{3}(a + b + c) + \frac{1}{3}(t\varrho + s\varrho^2).$$

To apply the foregoing investigation, we shall take a cubic equation, $x^3 - 3px - 2q = 0$, which is so prepared as to want the second term, then (Sect. 9)

$$a + b + c = 0,$$
$$ab + ac + bc = -3p,$$
$$a^2 + b^2 + c^2 = 6p,$$
$$a^3 + b^3 + c^3 = 6q,$$
$$abc = 2q;$$

consequently $t^3 + s^3 = 3^3 \times 2q$; $ts = 9p$, and $t^3 s^3 = 3^3 \times 3^3\,.\,p^3$. Hence

$$\frac{1}{3}t = (q + \sqrt{q^2 - p^3})^{\frac{1}{3}},$$

$$\frac{1}{3}s = (q - \sqrt{q^2 - p^3})^{\frac{1}{3}},$$

Wherefore, by substituting these values in the expressions of the roots, we get

$$a = (q + \sqrt{q^2 - p^3})^{\frac{1}{3}} + (q - \sqrt{q^2 - p^3})^{\frac{1}{3}},$$

$$b = \varrho^2\cdot(q + \sqrt{q^2 - p^3})^{\frac{1}{3}} + \varrho\,.\,(q - \sqrt{q^2 - p^3})^{\frac{1}{3}},$$

$$c = \varrho \cdot (q + \sqrt{q^2 - p^3})^{\frac{1}{3}} + \varrho^2 \cdot (q - \sqrt{q^2 - p^3})^{\frac{1}{3}}.$$

The preceding investigation, as well as all other methods that have been proposed for cubic equations, leads to the same result with the rule invented by Cardan; and, like that rule, it becomes in some cases insufficient for arithmetical computation, on account of the imaginary quantities that appear in the expressions of the roots. What is now mentioned is not an accidental circumstance, but a necessary consequence of the method of investigation pursued, and of the introduction of the imaginary roots of the equation $\varrho^3 - 1 = 0$. When a, b, c, are real quantities, the value of t and s will be both imaginary, because they involve ϱ and ϱ^2, or $\frac{-1+\sqrt{-3}}{2}$ and $\frac{-1-\sqrt{-3}}{2}$. In this case, therefore, although the three roots of the proposed equation are all real, yet the algebraic expressions of them are all imaginary, and useless for the purpose of numerical calculation; and the former circumstance is precisely the reason of the latter. On the other hand, when one root a is real and the other two imaginary, the impossible quantities destroy one another in the expressions of t and s, which are, therefore, real quantities; and in this case the algebraic formulæ answer for finding the numerical values of the roots. The distinction here pointed out depends on the radical $\sqrt{q^2 - p^3}$, which is real or imaginary, according as the equation has one or three real roots, because $q^2 - p^3$ is always positive in the first case and negative in the second.

Much labour and thought have been bestowed in order to free the formulæ for the roots of cubic equations from the imaginary expressions that render them unfit for arithmetical computation. In particular instances the difficulty disappears; namely, when the radical quantities are perfect cubes, in which cases the impossible parts of the cube roots destroy one another, so as to leave none but real quantities in the expressions of the roots of the equation. And, by expanding the radical quantities, we may in all cases obtain the roots of a cubic equation in series of an infinite number of terms free from the imaginary sign. But when it is required to transform the formulæ for the case of a cubic equation with three real roots, into finite expressions free from impossible quantities, and to do so without employing any other than the received notations of algebra, all attempts to solve the problem have led to equations in the same circumstances with the one proposed, and have ended in bringing back the same difficulty; in so much that equations of the description mentioned are said to be in the irreducible case.

It is, however, possible to transform the formulæ for the roots of a cubic equation in the irreducible case into real expressions, although not so as to fulfil all the conditions above mentioned. Let $q^2 - p^3 = y^2$; then $p = (q^2 - y^2)^{\frac{1}{3}}$: wherefore the equation $x^3 - 3px - 2q = 0$, will become

$$x^3 - 3\,(q^2 - y^2)^{\frac{1}{3}}\,x - 2q = 0 \ldots (1).$$

By the preceding formula the value of x in this equation will be

$$x = (q + y)^{\frac{1}{3}} + (q - y)^{\frac{1}{3}};$$

or, according to the notation of Section 10, making

$$n = \frac{1}{3},$$

$$x = 2\mathrm{H}_{\frac{1}{3}}\,(q, y^2).$$

By substituting this value of x, we get

$$\left\{2\,\mathrm{H}_{\frac{1}{3}}(q, y^2)\right\}^3 - 3\,(q^2 - y^2)^{\frac{1}{3}}.\left\{2\,\mathrm{H}_{\frac{1}{3}}(q, y^2)\right\} - 2q = 0;$$

which equation, being true for all values of q and y^2, must be identical, or, when expanded, must consist of a series of quantities that mutually destroy one another. Now the equation will still be identical, when y^2 is changed into $-y^2$; so that we shall have

$$\left\{2\,\mathrm{H}_{\frac{1}{3}}\,(q, -y^2)\right\}^3 - 3(q^2 + y^2)\,.^{\frac{1}{3}}\left\{2\,\mathrm{H}_{\frac{1}{3}}\,(q, -y^2)\right\} - 2\,q = 0;$$

and this proves that the equation

$$x^3 - 3\,(q^2 + y^2)^{\frac{1}{3}}\,.\,x - 2q = 0 \ldots (2)$$

is solved by the formula

$$x = 2\,\mathrm{H}_{\frac{1}{3}}\,(q, -y^2).$$

As the investigation in Section 10 is equally true, whether n be a whole or a fractional number, we may apply it to find the value of the symbol $2\mathrm{H}_{\frac{1}{3}}\,(q, -y^2)$.

For this purpose, let

$q = r \cos.\,\varphi = r \cos.\,(\varphi + 360°) = r \cos.\,(\varphi + 2\,.\,360°)$,

$y = r \sin.\,\varphi = r \sin.\,(\varphi + 360°) = r \sin.\,(\varphi + 2\,.\,360°)$;

then $r = \sqrt{q^2 + y^2}$; and, according as we take one or other of the angles that have the same sines and cosines, we shall obtain three different values of $2\mathrm{H}_{\frac{1}{3}}\,(q, -y^2)$, or of x, viz.:

$$a = 2r^{\frac{1}{3}}\,.\,\cos.\,\frac{\varphi}{3},$$

$$b = 2r^{\frac{1}{3}}\,.\,\cos.\left(\frac{\varphi}{3} + 120°\right),$$

$$c = 2r^{\frac{1}{3}}\,.\,\cos.\left(\frac{\varphi}{3} + 240°\right).$$

By putting $p = (q^2 + y^2)^{\frac{1}{3}}$, the equation (2) will assume the same form as at first, namely,

$$x^3 - 3px - 2q = 0;$$

and because $p^3 = q^2 + y^2 = r^2$, and $y = \sqrt{p^3 - q^2}$, if we determine the angles by means of their tangents instead of their sines and cosines, we shall get $\frac{\sqrt{p^3 - q^2}}{q} = \tan.\,\varphi = \tan.\,(\varphi + 360°) = \tan.\,(\varphi + 2\,.\,360°)$; and the three roots of the equation will be

$$a = 2\sqrt{p}\,.\,\cos.\,.\,\frac{\varphi}{3},$$

$$b = 2\sqrt{p}\,.\,\cos.\left(\frac{\varphi}{3} + 120°\right),$$

$$c = 2\sqrt{p}\,.\,\cos.\left(\frac{\varphi}{3} + 240°\right).$$

Every cubic equation falls under one or other of the formulæ (1) and (2), except when $y = 0$, or $p^3 = q^2$, which takes place when an equation changes from one class to another; and in this case we have

$$x^3 - 3q^{\frac{2}{3}}\,.\,x - 2q = (x - 2\,q^{\frac{1}{3}})\,.\,(x + q^{\frac{1}{3}})\,.\,(x + q^{\frac{1}{3}}).$$

The several rules that have now been given, therefore, include every possible case.

The difficulty attending the irreducible case arises from a real distinction between the two subordinate classes of cubic equations, and is insurmountable by the ordinary operations of algebra. There is no permanent distinctions of equations belonging to the same order, when we consider their roots as positive or negative; because, in any proposed equation, all the roots, or as many of them as we please, can be changed from positive to negative, by the simple artifice of increasing or diminishing them

Equations.

all by a given quantity. But the case is otherwise when we consider the roots of an equation in their character of real or imaginary quantities. No transformation can change an equation with one real root into another with three real roots, without involving the operations of the impossible arithmetic. If, therefore, we lay down this condition, namely, that the formulæ for the roots of equations must be in a shape fit for numerical calculation, we may conclude that in fact there is no resolution of equations except what consists in reducing all those of the same class to some one of that class, the most simple and convenient in its form that can be found. If we examine the preceding investigation, it will appear that it is merely an attempt to reduce all cubic equations to the form $x^3 - A = 0$; and this readily succeeds without impossible operations, when the proposed equation, and that with which it is compared, have their roots of a similar description; and it as surely fails when the case is otherwise.

In geometry, where the relations of the magnitudes under consideration are never lost sight of, there is no tendency to refer the solution of a problem to a class to which it does not belong. The ancient geometer could never be in danger of applying the problem for finding two mean proportionals to a case that can be constructed only by the trisection of an angle. The modern analyst, dismissing the original magnitudes of his problem, and reducing all possible relations to equations in abstract numbers, is apt to overlook distinctions, and sometimes to waste his labour, in seeking to accomplish what a due separation of cases would show to be impossible. There is the same distinction between the class of cubic equations with one real root, and that with three real roots, that there is between the two geometrical problems alluded to above; and the algebraist who attempts, by means of the ordinary operations of his art, to transform Cardan's formula so as to make it apply to the irreducible case, is precisely in the same situation with the geometer who should set about trisecting an angle by finding two mean proportionals.

The power and force of the algebraic method does not consist in breaking down real distinctions, but in connecting, by sure and general principles, many truths which in geometry are joined only by vague analogies, and even have no affinity at all. This advantage is derived chiefly from the doctrine of negative quantities, and from the impossible arithmetic. By means of the first, a formula which is obtained by considering only one state of the data of a problem, applies, necessarily and by the very structure of analytical language, to the same problem in all possible conditions of the data. On the other hand, when the relations of the data vary, the geometer is obliged to subdivide his problem into cases, or into other subordinate problems; and although it may be perceived that great similitude prevails among all the subdivisions, yet it is impossible to reduce the analogy between them to determinate rules, as is done in algebra. But in the whole compass of geometry there is nothing that bears any resemblance to the imaginary arithmetic. When the geometer has fixed the *determination* of his problem, or ascertained the limits within which it is possible, he has drawn a line that must be the boundary of his investigation. Now it is to truths lying beyond this line that the meaning of the comprehensive expressions of the imaginary arithmetic must be referred. It is not to be understood that a problem can be solved by algebra, which is impossible in geometry; but the analytical formulæ, at the same time that they mark the limits of the problem, go beyond them, and point out connected truths, that require only certain changes to be made in the algebraic expressions, in like manner as all the possible cases of the same problem are derived from one only, by means of the variations of the signs.

Biquadratic equations.

If a, b, c, d, represent the four roots of a biquadratic equation; and if we prefix the same letter a to all the permutations made with the other three, we shall get the six combinations following, viz.

$$\begin{array}{lll} abcd, & adbc, & acdb, \\ adcb, & acbd, & abdc. \end{array}$$

In the first line, the letters b, c, d, are made to circulate, by placing immediately after the immoveable letter a that which stands last in the combination preceding; and in the second line the moveable letters have respectively an inverted order to what they have in the first line.

Let $\varrho^2 - 1 = 0$; and let the four letters taken in the several orders of the six combinations be prefixed to the terms of $1 + \varrho + \varrho^2 + \varrho^3$; the results of the first line being t, t', t'', and those of the second line s, s', s''; then

$$\begin{array}{ll} t = a + b\varrho + c\varrho^2 + d\varrho^3, & s = a + d\varrho + c\varrho^2 + b\varrho^3, \\ t' = a + d\varrho + b\varrho^2 + c\varrho^3, & s' = a + c\varrho + b\varrho^2 + d\varrho^3, \\ t'' = a + c\varrho + d\varrho^2 + b\varrho^3, & s'' = a + b\varrho + d\varrho^2 + c\varrho^3. \end{array}$$

Now, in the equation $\varrho^2 - 1 = 0$, ϱ is either equal to $+1$ or to -1; and whether we take the one value or the other, it is apparent that $t = s$, $t' = s'$, $t'' = s''$.

Again, from every one of the six foregoing combinations, four others are derived by circulating the letters continually from the last place to the first; and in this manner we obtain twenty-four permutations, which are all that can be made with four letters. Thus, if we take $abcd$, and move the letters as directed, we shall get these four combinations, viz.

$$\begin{array}{l} abcd, \\ dabc, \\ cdab, \\ bcda. \end{array}$$

And if we multiply t by ϱ continually, observing to retain the three first powers of ϱ, and to make $\varrho^4 = 1$, we shall get

$$\begin{aligned} t &= a + b\varrho + c\varrho^2 + d\varrho^3, \\ t\varrho &= d + a\varrho + b\varrho^2 + c\varrho^3, \\ t\varrho^2 &= c + d\varrho + a\varrho^2 + b\varrho^3, \\ t\varrho^3 &= b + c\varrho + d\varrho^2 + a\varrho^3; \end{aligned}$$

so that $t, t\varrho, t\varrho^2, t\varrho^3$, are the functions formed by prefixing to $1 + \varrho + \varrho^2 + \varrho^3$, the letters of the four combinations; and it is obvious that these functions have all the same square, equal to t^2.

Wherefore, if the four letters, taken in all possible orders, be prefixed to the terms of $1 + \varrho + \varrho^2 + \varrho^3$, the squares of the twenty-four resulting functions will be equal to one or other of the six quantities, $t^2, t'^2, t''^2, s^2, s'^2, s''^2$; and since it has been proved that $t = s$, $t' = s'$, $t'' = s''$, it follows that the twenty-four squares have no more than three different values, equal to t^2, t'^2, t''^2.

And because t^2, t'^2, t''^2, can have no more than one value each, any symmetrical functions of them, viz.

$$\begin{array}{l} t^2 + t'^2 + t''^2, \\ t^2 t'^2 + t^2 t''^2 + t'^2 t''^2, \\ t^2 t'^2 t''^2, \end{array}$$

will have determinate values independent of the order of the letters a, b, c, d. The same functions will therefore be symmetrical expressions of the roots of the given biquadratic equation, and they will be known in terms of the co-efficients of that equation.

Supposing $\varrho = -1$, we get

$$\begin{aligned} t &= a - b + c - d, \\ t' &= a - d + b - c, \\ t'' &= a - c + d - b; \end{aligned}$$

and hence

$$\begin{aligned} t^2 &= a^2 + b^2 + c^2 + d^2 \\ &\quad - 2(ab + ad + bc + cd) + 2(ac + bd), \\ &= (a + b + c + d)^2 - 4\Sigma . ab + 4(ac + bd) \end{aligned}$$

the symbol $\Sigma \,.\, ab$ being used here, as in Sect. 9, to denote the sum of the products of every two of the roots. Wherefore, if we put

$$M = (a+b+c+d)^2 - 4\Sigma \,.\, ab,$$
$$m = ac+bd,$$
$$m' = ab+dc,$$
$$m'' = ad+bc,$$

then

$$t^2 = M+4m,$$
$$t'^2 = M+4m',$$
$$t''^2 = M+4m'';$$

and hence

$$t^2+t'^2+t''^2 = 3M+4(m+m'+m''),$$
$$t^2t'^2+t^2t''^2+t'^2t''^2 = 3M^2+ 8M(m+m'+m'') +16(mm'+mm''+m'm'').$$

But it will readily appear that

$$m+m'+m'' = \Sigma \,.\, ab$$
$$mm'+mm''+m'm'' = (a+b+c+d) \times \Sigma \,.\, abc - 4abcd.$$

Now, by substituting these values, we get

$$t^2+t'^2+t''^2 = 3(a+b+c+d)^2 - 8\Sigma \,.\, ab,$$
$$t^2t'^2+t^2t''^2+t'^2t''^2 = 3(a+b+c+d)^4 - 16(a+b+c+d)^2 \times \Sigma \,.\, ab + 16(a+b+c+d) \times \Sigma \,.\, abc + 16(\Sigma \,.\, ab)^2 - 64abcd.$$

Again, if we multiply the expressions of t, t', t'', we shall get

$$tt't'' = (a-c) \,.\, (a^2-c^2)+(b-d) \,.\, (b^2-d^2) - (a+c)\,(b-d)^2 - (b+d)\,(a-c)^2;$$

or, $tt't'' = a^3+b^3+c^3+d^3+2\Sigma \,.\, abc - (a^2b+a^2c+a^2d+b^2a+b^2c+b^2d+c^2a+c^2b+c^2d+d^2a+d^2b+d^2c)$;

and finally, by means of the formulæ in Sect. 9,

$$tt't'' = (a+b+c+d)^3+8\Sigma \,.\, abc - 4(a+b+c+d) \times \Sigma \,.\, ab.$$

If now we substitute the values computed by the preceding formulæ in the cubic equation

$$0 = u^3 - (t^2+t'^2+t''^2)u^2 + (t^2t'^2+t^2t''^2+t'^2t''^2)u - t^2t'^2t''^2,$$

we shall obtain the values of t^2, t'^2, t''^2, and consequently of t, t', t'', by solving that equation; and when t, t', t'', are known, we have

$$a+b+c+d = a+b+c+d,$$
$$t = a+b\varrho+c\varrho^2+d\varrho^3,$$
$$t' = a+d\varrho+b\varrho^2+c\varrho^3,$$
$$t'' = a+c\varrho+d\varrho^2+b\varrho^3;$$

wherefore, because $0=1+\varrho+\varrho^2+\varrho^3$, we get

$$a=\frac{1}{4}\left\{a+b+c+d+t+t'+t''\right\},$$
$$b=\frac{1}{4}\left\{a+b+c+d+t\varrho^3+t'\varrho^2+t''\varrho\right\},$$
$$c=\frac{1}{4}\left\{a+b+c+d+t\varrho^2+t'\varrho+t''\varrho^3\right\},$$
$$d=\frac{1}{4}\left\{a+b+c+d+t\varrho+t'\varrho^3+t''\varrho^2\right\}.$$

And finally, by making $\varrho=-1$,

$$a=\frac{1}{4}\left\{a+b+c+d+t+t'+t''\right\},$$
$$b=\frac{1}{4}\left\{a+b+c+d-t+t'-t''\right\},$$
$$c=\frac{1}{4}\left\{a+b+c+d+t-t'-t''\right\},$$
$$d=\frac{1}{4}\left\{a+b+c+d-t-t'+t''\right\}.$$

In applying these formulæ, it is necessary to observe, that as the quantities t, t', t'', are found by extracting the square root, they may each have either the sign plus or the sign minus prefixed. But all ambiguity from this cause will be taken away, if it be observed that the expressions of a, b, c, d, will always give the same results, provided the signs of t, t', t'', be so determined as to satisfy the equation,

$$tt't''=(a+b+c+d)^3+8\Sigma \,.\, abc - 4(a+b+c+d) \times \Sigma \,.\, ab.$$

For, if we suppose that the signs of t, t', t'', are so determined as to satisfy the equation mentioned, they cannot be varied so as still to satisfy the same equation, unless two of them be changed together; for, if one sign only be changed, or if all the three be changed together, the product $tt't''$ will have an opposite sign to what it had before, and the equation will no longer be satisfied. But the expressions of a, b, c, d, give the same set of values when the signs of any two of the letters t, t', t'', are changed together; so that, in order to have the true values of the quantities sought, no other rule for the signs of t, t', t'', is necessary than that they must be such as to satisfy the equations alluded to.

To apply the preceding investigation, we may take the equation

$$x^4+px^2+qx+r=0,$$

which wants the second term. Then,

$$o=a+b+c+d,$$
$$p=\Sigma \cdot ab,$$
$$-q=\Sigma \,.\, abc,$$
$$r=abcd:$$

hence

$$t^2+t'^2+t''^2=-8p,$$
$$t^2t'^2+t^2t''^2+t'^2t''^2=16p^2-64r,$$
$$tt't''=8q:$$

and t^2, t'^2, t''^2, are the roots of the cubic equation

$$u^3+8pu^2+16(p^2-4r)u-64q^2=0.$$

Having solved this equation, and found the values of t, t', t'', the signs of these quantities must next be determined so as to satisfy the equation,

$$tt't''=-8q;$$

and then we have these formulæ for computing the roots of the proposed equation, viz.

$$a=\frac{t+t'+t''}{4},$$
$$b=\frac{-t+t'-t''}{4},$$
$$c=\frac{t-t'-t''}{4},$$
$$d=\frac{-t-t'+t''}{4}.$$

These formulæ coincide with the method of solving biquadratic equations first proposed by Euler in his Algebra. But, in order to take away the ambiguity arising from the double sign of the square root, that celebrated mathematician uses two sets of expressions for the roots of the equation, viz.

$$a=\frac{t+t'+t''}{4}, \qquad a=\frac{-t-t'-t''}{4},$$
$$b=\frac{-t+t'-t''}{4}, \qquad b=\frac{t-t'+t''}{4},$$
$$c=\frac{t-t'-t''}{4}, \qquad c=\frac{-t+t'+t''}{4},$$
$$d=\frac{-t-t'+t''}{4}, \qquad d=\frac{t+t'-t''}{4},$$

of which one set is the same with the formulæ given above, and the other is obtained by changing t, t', t'', into $-t, -t', -t''$: the first set being directed to be used

Equations. when $-8q$ is positive, and the other set when the same quantity is negative. This procedure is not so simple as that we have followed, which requires only one set of formulæ. It has even been the occasion of leading into error, in as much as it makes the signs of t, t', t'', depend entirely upon the sign of the given quantity $-8q$; whereas it is indispensable that, regard being had to the nature of the quantities t, t', t'', their signs shall be determined so as to satisfy the equation $tt't'' = -8q$. This inadvertence of Euler has escaped the observation of most of the authors who have treated of biquadratic equations, and was first noticed by M. Bret, in the second volume of the *Correspondance sur l'Ecole Polytechnique.*

It may not be improper to notice briefly some of the other rules for biquadratic equations. These are chiefly two; the method of Descartes, which resolves the given equation into two quadratic factors; and the oldest method of all, invented by Louis Ferrari, a pupil of Cardan, which proceeds by transforming the given equation, so as to make it equal to the difference of two complete squares, and then extracting the square roots. However different from one another these two methods may at first seem, they are at bottom the same; and they are so far connected with that already investigated, that all the three lead to the same cubic equation.

Suppose that a, b, c, d, are the roots of the biquadratic equation

$$x^4 - Ax^3 + Bx^2 - Cx + D = 0;$$

then $x^2 - (a+b)x + ab = 0$, and $x^2 - (c+d)x + cd = 0$, are two quadratic factors, the product of which is equal to the given equation. Now,

$$A = a + b + c + d,$$
$$t = a + b - c - d;$$

wherefore, if we put $ab = p + y$, $cd = p - y$, the two factors will become

$$x^2 - \frac{1}{2}(A + t)x + p + y = 0,$$

$$x^2 - \frac{1}{2}(A - t)x + p - y = 0:$$

and if we multiply them, and equate the co-efficients of the product to the co-efficients of the given equation, we shall get

$$2p + \frac{1}{4}A^2 - \frac{1}{4}t^2 = B,$$
$$Ap + ty = C,$$
$$p^2 - y^2 = D.$$

And it is to be observed that, on account of the first two of these equations, p and y are both real quantities when t is a real quantity; so that, provided a real value of t can be found, the given equation is always resolved, by this method, into two quadratic factors free from imaginary expressions.

Now, by combining the equations just found, we shall get

$$\begin{aligned} 0 = t^6 &- (3A^2 - 8B) \cdot t^4 \\ &+ (3A^4 - 16A^2B + 16B^2 + 16AC - 64D) \cdot t^2 \\ &- (A^3 - 4AB + 8C)^2, \end{aligned}$$

$$p = \frac{1}{2}B - \frac{1}{8}A^2 + \frac{1}{8}t^2$$

$$y = \sqrt{\left(\frac{1}{2}B - \frac{1}{8}A^2 + \frac{1}{8}t^2\right)^2 - D}.$$

The first of these equations is a cubic, of which the root is t^2; and it is precisely the same with the cubic of the former method. As the last term of this equation is essentially positive, it follows that there is always one positive value of t^2, and one real value of t; wherefore, in consequence of what has been proved, the values of p and y, derived from the positive value of t^2, are in every case real quantities, which is no doubt an advantage in the practical application of the method. Equations.

If we wish to follow the process of Louis Ferrari, we may assume p, t, y, so as to render the expression

$$\left(x^2 - \frac{1}{2}Ax + p\right)^2 - \left(\frac{1}{2}tx + y\right)^2 = 0$$

identical with the given equation; and as this expression is no more than the product of the two quadratic factors of the last method, the quantities to be determined will be found by the formulæ already given.

Equations of the fifth degree.

The theory of permutations, which is successful in solving cubic and biquadratic equations, applies likewise to those of the fifth and higher orders. But, to use the words of Lagrange, "Passé le quatrième degré, la méthode, quoiqu' applicable en général, ne conduit plus qu'à des équations resolvantes de degres superieurs à celui de la proposée." Thus, in the case of equations of the fifth degree, the theory leads to a biquadratic equation, of which the co-efficients are to be found by resolving an equation of the sixth order.

There is, however, no doubt that the doctrine of permutations contains the principles from which we are to expect the resolution of equations of the higher orders, if the problem be possible. It may be alleged, with great probability, that the theory succeeds in the less complicated cases, because when the number of the roots is small, their permutations are soon exhausted, and we speedily arrive at those combinations of them which remain invariable, whatever be the order of the quantities combined. But when the number of the roots is greater than four, their permutations are very numerous, and at the same time the functions produced by combining them are very complicated; on which accounts it is difficult to conduct the investigation so as to arrive at a satisfactory conclusion, either accomplishing the intended purpose, or proving that the undertaking is impossible.

In the twelfth volume of the *Italian Society*, and in a work published at Modena in 1813, M. Paolo Ruffini has proved that no function of five letters can exist that is susceptible of only three or four different values when the letters are interchanged among one another in all possible ways. M. Cauchy, in the sixteenth volume of the *Journal de l'Ecole Polytechnique*, has demonstrated that a function of n letters, unless it have no more than two different values, cannot have a number of different values less than the prime number next below n. On these grounds it has been inferred that the resolution of equations of the fifth degree is in reality an impossible problem. (Lacroix, *Compt. des Elem. d'Algebre*, p. 61.) And if it be admitted that, in the process of resolution, no equations can occur except such as have symmetrical functions of the five letters for their co-efficients, the inference founded on the labours of the eminent mathematicians we have mentioned would be indisputable. But it is not impossible that the resolution of equations of a high order must be effected by gradually depressing an equation at first of great dimensions; and in this procedure we may arrive at equations, the co-efficients of which, although functions of the roots of the proposed equation, are not symmetrical functions, but partial expressions, susceptible of several values, according as the order of the letters that denote the roots is made to vary. On this supposition, the resolution of equations above the fourth order, by means of equations inferior in degree, would not be inconsistent with what has been proved.

Some particular classes of equations.

17. A method for solving equations of one order may be generalized so as to extend to a certain class in all orders. Thus De Moivre has found a species of equations

of every degree that have their roots similar to those of cubics, and which are solved by the formula

$$x = (q + \sqrt{q^2 - p^n})^{\frac{1}{n}} + (q - \sqrt{q^2 - p^n})^{\frac{1}{n}},$$

differing in no respect from the expression for resolving cubics, except that n is written in place of 3.

An equation may be depressed to a lower order when it is known that the roots have a given relation to one another. An instance of this has already occurred in the case of equal roots; for, the equal roots having been first found, the equation can be lowered by division. Reciprocal equations furnish another example of depression to a lower order, on account of a relation subsisting among the roots. A reciprocal equation is one of even dimensions, such that half the roots are respectively the reciprocals of the other half, in which case no alteration is produced in the equation when $\frac{1}{x}$ is substituted for x. In equations of this kind, the same co-efficients occur in the same order, and with the same signs, reckoning from either end; a description that likewise applies to some equations of odd dimensions, which, however, do not constitute a new class, being merely reciprocal equations, as defined above, multiplied by the factor $x + 1$. A reciprocal equation may always be depressed to half the dimensions, by transforming it so that the new unknown quantity shall be equal to $x + \frac{1}{x}$. It is sufficient to have mentioned these cases, which are fully treated of in all the elementary books.

Equations with only two terms, as $x^p - 1 = 0$, are the most extensive class that have been resolved by a general method. The successful application of analysis to this class of equations is extremely interesting, both in itself, and likewise because it is connected with the division of the circle into equal parts, and has occasioned the discovery of some curious and unexpected results respecting that problem. For these reasons, it appears proper to lay before our readers a short view of this branch of the doctrine of algebraic equations.

We have already shown, that, admitting the theory of angular sections, every equation with only two terms, as $x^p - 1 = 0$, may be completely resolved into its binomial and trinomial factors; and hence all its roots, possible and impossible, may be computed by means of the trigonometrical tables in common use. If we put $\varphi = \frac{360°}{p}$, and denote by k any number less than $\frac{1}{2}p$, we have found that the equation $x^p - 1 = 0$ is divisible by the quadratic factor $x^2 - 2x$, $\cos. \varphi + 1$, and, consequently, that it has the two impossible roots,

$$x = \cos. k\varphi + \sin. k\varphi . \sqrt{-1},$$
$$x = \cos. k\varphi - \sin. k\varphi . \sqrt{-1}:$$

and, because $\cos. k\varphi = \cos. (p-k)\varphi$, and $-\sin. k\varphi = \sin. (p-k)\varphi$, the same two roots may be otherwise more symmetrically represented thus,

$$x = \cos. k\varphi + \sin. k\varphi . \sqrt{-1},$$
$$x = \cos. (p-k)\varphi + \sin. (p-k)\varphi . \sqrt{-1}.$$

Therefore, when p is odd, the equation $x^p - 1 = 0$ has one real root equal to 1; and when p is even, it has two real roots equal to ± 1; and in both cases the remaining roots are all impossible, and are found from the formula

$$x = \cos. k\varphi + \sin. k\varphi . \sqrt{-1},$$

by making k equal to all the integral numbers less than p in the one case, and less than $p - 1$ in the other. Nothing, therefore, can be more simple than the computation of the roots of such equations by means of the trigonometrical tables. But in seeking a general solution, it is required to investigate the roots without resorting to the properties of the circle, unless in so far as this may be necessary for solving similar equations inferior in degree to the one proposed. In this view the resolution of the equation $x^p - 1 = 0$, is equivalent to the division of the circle into p equal parts, granting the like division for all numbers less than p. And in order to render the investigation of the problem as simple as possible, it may be further observed, that it will be sufficient to consider the case when the exponent is a prime number; because, from this case, the other, when it is a composite number, can be readily deduced.

It will be proper to premise here a property of the roots of equations with only two terms, to which we shall have occasion continually to refer. The property in question depends upon this theorem, namely, when k is any number not a multiple of the prime number p, the remainders of the terms of the series

$$1 \times k, 2 \times k, 3 \times k \ldots (p-1) \times k,$$

when each is divided by p, are all different from one another; and, consequently, without regard to the order, they will coincide with the numbers 1, 2, 3, &c. less than p. If, therefore, we take any one of the impossible roots of the equation $x^p - 1$, viz.

$$r = \cos. k\varphi + \sin. k\varphi \sqrt{-1},$$

all its powers with indices less than p, viz.

$$r^2 = \cos. 2k\varphi + \sin. 2k\varphi . \sqrt{-1},$$
$$r^3 = \cos. 3k\varphi + \sin. 3k\varphi . \sqrt{-1},$$
&c.

will be different from one another; and likewise they will coincide, without regard to the order, with the like powers of any other impossible root of the same equation: because, whatever number k stands for, the arcs are all different from one another, and, neglecting whole circumferences, constitute the same series of terms, although in different orders. Wherefore, p being a prime number, if r be one of the impossible roots of the equation $x^p - 1 = 0$, all the roots will be represented by the terms of the geometrical progression

$$r^0, r^1, r^2, r^3, \ldots . r^{p-1};$$

for every one of these terms satisfies the given equation, and it has been shown that they are all different from one another.

When p is a composite number, the same property does not belong to all the roots of the equation $x^p - 1 = 0$, but only to some of them. It belongs generally to the root

$$r = \cos. k\varphi + \sin. k\varphi . \sqrt{-1},$$

when k is either equal to unit, or to any number that has no common divisor with p; in which cases all the powers of r are roots of the equation $x^p - 1 = 0$, and all different from one another, when the exponents are different and less than p.

If the equation $x^p - 1 = 0$ be divided by the binomial factor $x - 1$, we shall get

$$x^{p-1} + x^{p-2} + x^{p-3} \ldots . + x + 1 = 0;$$

and this being a reciprocal equation, it can be farther depressed to half the dimensions. In this manner we obtain the solution of $x^7 - 1 = 0$, which is reduced to a cubic; but, by the same procedure, the equation next in order,

viz. $x^{11}-1=0$, can be lowered only to the fifth degree, for equations of which class there is no rule. Nevertheless this last equation has been solved by Vandermonde, to whom, and to Lagrange, we are mainly indebted for disengaging the resolution of equations from the complicated operations of algebra, and for substituting, in their place, reasonings founded on the doctrine of combinations. The author has not explained particularly the process by which his solution was obtained; he gives it as a result of his theory, which, although it fails in general for equations above the fourth degree, succeeds in this instance on account of particular relations between the roots. Similar relations subsist between the roots of any other binomial equation when the exponent is a prime number; and, in consequence, a like mode of investigation will apply, as indeed the author has expressly said. But this procedure would unavoidably be attended in every new instance with very long calculations; and it appears hardly possible to arrive in this way at any general method that would apply to all equations of the class in a regular manner, and without considerations drawn from each particular case.

M. Gauss, in a work entitled *Disquisitiones Arithmeticæ*, replete with original and important matter, applied a property of prime numbers to the solution of binomial equations, which removed every difficulty, and led to a theory that unites simplicity and generality. If we suppose that p is a prime number, and resolve $p-1$ into its component factors, so that $p-1=a^{\lambda}.b^{\mu}.c^{\gamma}$. &c., a, b, c, &c. being prime numbers, M. Gauss has proved that the solution of the equation $x^p-1=0$, or, which is the same thing, the division of the circle into p equal parts, can be effected by solving successively λ equations of a dimensions, μ equations of b dimensions, γ equations of c dimensions, &c. Thus, if $p=13$, then, because $13-1=3\times 2^2$, the roots of $x^{13}-1=0$ can be found, or a polygon of 13 sides can be inscribed in a circle, by solving a cubic and two quadratic equations in succession. In certain cases, when a prime number comes under the form 2^n+1, as 17, 257, &c. the division of the circle will require the solution of equations no higher than the second order; whence this unexpected consequence has resulted from the theory of M. Gauss, that the inscription of a polygon of 17, or 257 sides in a circle, which are problems that have always been understood to transcend the limits of the elementary geometry, can, nevertheless, be constructed by the operations admitted in that science.

A work replete with so many interesting discoveries as the *Disquisitiones Arithmeticæ* could not fail to excite the attention of mathematicians. Legendre, in republishing his *Essay on the Theory of Numbers*, has added to it an exposition of M. Gauss's theory of binomial equations; and the same theory is the subject of the 14th note in the second edition of Lagrange's *Treatise on Numerical Equations*. No part of the mathematics could pass through the hands of men of so much ability without receiving great improvement. Lagrange has shown that it is not necessary to go through the several intermediate equations that make so essential a part in the investigation of M. Gauss; and, by this means, he has reduced the solution of equations with two terms to the utmost simplicity of which it is capable. But, in one respect, it must be admitted that the procedure of the illustrious geometer is imperfect. Although it arrives, by a short investigation, at the partial quantities that by their additions form the expressions of the roots sought, it leaves indeterminate the order in which they are to be combined. M. Gauss has avoided ambiguity in this respect by deducing from one of the quantities all the other parts of the same expression; but, amidst a multiplicity of different systems of values that may be deduced from the partial quantities, Lagrange has given no clue to guide to the true one.

In laying before our reader some account of this interesting branch of the theory of algebraic equations, we shall view the subject in a light somewhat different from that in which it has hitherto been placed. Instead of seeking directly the roots of binomial equations, we shall apply the principles of M. Gauss's theory immediately to the division of the circle into equal parts, by taking the arcs of the circumference in that order to which the method owes all its success. This procedure is attended with some advantages. In the first place, the algebraic expressions of the quantities sought, represented by $\cos.\frac{k\times 360°}{p}$, are more simple than those of the imaginary roots of the corresponding binomial equation; and, in the second place, the same expressions, having always real values, are better fitted for application than the roots of binomial equations, which require to be further reduced to prepare them for calculation.

Before entering on the principal problem, it is necessary to say something of that property of numbers on which the whole theory depends. Supposing p to be any prime number, Euler has distinguished by the name of a *Primitive Root* any number less than $p-1$, such that, if we take the series of all its powers with indices less than p, and in each power reject the multiples of p it contains, the several remainders are all different from one another, and, consequently, paying no regard to the order, they will coincide with the numbers 1, 2, 3, &c. less than p. It has been proved that, for every prime number, there are as many primitive roots as there are numbers less than $p-1$, which have no common divisor with it. The existence of such numbers in every case is therefore demonstrated; but no direct method of finding them has yet been published with which we are acquainted.

We gladly seize the present occasion of laying down a rule for finding the primitive roots of a prime number. But first we must premise, that when any proposed number is said to satisfy the equation $x^m+1=0$, it is always understood that the multiples of the prime number p are rejected; and the meaning is, that, when the given number is substituted for x, the whole result is divisible by p without any remainder.

Now, let p be a prime number, and 2, a, b, c, &c. the prime divisors of $p-1$, so that $p-1=2^{\pi}.a^{\lambda}.b^{\mu}.c^{\gamma}$. &c.: then every primitive root will satisfy the first of the following equations without satisfying any of the rest, viz.

$$x^{\frac{p-1}{2}}+1=0,$$
$$x^{\frac{p-1}{2a}}+1=0,$$
$$x^{\frac{p-1}{2b}}+1=0,$$
$$x^{\frac{p-1}{2c}}+1=0,$$
&c.

And, on the other hand, every number not a primitive root, which satisfies the first equation, will at the same time satisfy one, or more, or all, of the other equations.

But the numbers which satisfy the first equation are exclusively those which are not found among the remainders of the series of square numbers divided by p.

Wherefore, setting aside the first equation, if we seek among the non-residual numbers for such as satisfy none of the remaining equations, the numbers so found will be the primitive roots sought.

When one primitive root is found by this method, all the rest may be directly obtained from it. For, if 1, w, w', w'', &c. . . . $n^{(n)}$, represent all the numbers less than $p-1$ and prime to it; then a being one of the primitive roots, all the roots will be equal to the series of powers,

$$a, a^w, a^{w'}, a^{w''}, \ldots\ldots a^{w^{(n)}},$$

rejecting always the multiples of p.

The demonstration of these properties would lead us aside from our present purpose; and we shall be content with adding some examples for the sake of illustration.

Let $p=11$: then $\frac{p-1}{2}=5$, and $\frac{p-1}{2.5}=1$; so that in this case, the only equation of exclusion is $x+1=0$, which admits only one solution, viz. $x=p-1=10$. Therefore all the non-residual numbers except 10 are the primitive roots; namely, 2, 6, 7, 8. We may extend this conclusion to every case when $\frac{p-1}{2}$ is a prime number, as 7, 23, 47, &c.; in all which instances all the non-residuals, except $p-1$, are the primitive roots.

Next, let $p=17$; then $\frac{p-1}{2}=8=2^3$; and there are no equations of exclusion. In this case, therefore, all the non-residuals, without exception, are primitive roots; and the same thing is true of every prime number of the form 2^n+1, such as 5, 257, &c.

Let $p=13$; then $\frac{p-1}{2}=2\times 3$; and the only equation of exclusion is

$$x^2+1=0,$$

which admits only two solutions, viz. $x=5$ and $x=8$. In this instance, therefore, all the non-residual numbers, except 5 and 8, are the primitive roots.

Let $p=31$; then $\frac{p-1}{2}=3\times 5$; and we have two equations of exclusion, viz.

$$x^3+1=0,$$
$$x^5+1=0.$$

The non-residual numbers are

3, 6, 11, 12, 13, 15, 17, 21, 22, 23, 24, 26, 27, 29, 30.

Of these numbers the first, viz. 3, is a primitive root, since it satisfies neither of the two equations; and as the numbers less than 30, and prime to it, are 1, 7, 11, 13, 17, 19, 23, 29; all the primitive roots of 31 are as follows: viz. $3^1=3$, $3^7=17$, $3^{11}=13$, $3^{13}=24$, $3^{17}=22$, $3^{19}=12$, $3^{23}=11$, $3^{29}=21$. With respect to the other non-residual numbers, it will be found on trial that the first equation is satisfied by 6 and 26; the second by 15, 23, 27, 29; and both equations by 30.

We are now prepared to enter upon the solution of the problem for dividing the circle into as many equal parts as there are units in the prime number $p=2n+1$. If we conceive a polygon of p sides, to be inscribed in a circle, it will be admitted that the centre of gravity of the polygon coincides with the centre of the circle. Wherefore, if perpendiculars be drawn to any diameter of the circle from all the angles of the polygon, it follows, from the nature of the centre of gravity, that the sum of the cosines lying on one side of the centre of the circle will be equal to the sum of the cosines lying on the other side. Let $\varphi=\frac{360°}{p}$; and put u for the arc intercepted between the diameter and any angle of the polygon, then we shall have this equation, viz.

$$0=\cos.u+\cos.(\varphi+u)+\cos.(2\varphi+u)\ldots.+\cos.(2n\varphi+u),$$

which is no more than the analytical expression of the geometrical property just mentioned. Now, suppose that the diameter passes through one of the angles of the polygon; then $u=0$, and the equation becomes

$$0=1+\cos.\varphi+\cos.2\varphi+\cos.3\varphi\ldots.+\cos.2n\varphi.$$

Let a be one of the primitive roots of the prime number p; then rejecting multiples of p, and paying no regard to the order, the terms of the geometrical progression,

$$a, a^2, a^3, a^4\ldots\ldots a^{2n},$$

will be equal to the several numbers less than p. Wherefore, in the two series of arcs,

$$a\varphi, a^2\varphi, a^3\varphi, a^4\varphi\ldots\ldots a^{2n}\varphi,$$
$$\varphi, 2\varphi, 3\varphi, 4\varphi\ldots\ldots 2n\varphi,$$

every arc in the geometrical progression will either be equal to some one in the arithmetical progression, or will differ from it by a whole circumference, or circumferences. Hence the cosines of the first series of arcs may be substituted in the last equation for the cosines of the other series; and thus we have

$$-1=\cos.a\varphi+\cos.a^2\varphi+\cos.a^3\varphi\ldots+\cos.a^{2n}\varphi.$$

Again, by Fermat's theorem, $a^{2n}-1=(a^n+1)(a^n-1)$ $=$ a multiple of p; and because no primitive root of a prime number is the remainder of a square divided by that number, we have $a^n+1=$ a multiple of p; and consequently $a^{n+\lambda}+a^{\lambda}=$ a multiple of p. It follows, therefore, that $a^{n+\lambda}\varphi+a^{\lambda}\varphi$ is equal to a multiple of the circumference of the circle; and hence,

$$\cos.a^{n+\lambda}\varphi=\cos.a^{\lambda}\varphi \qquad \text{(A)}$$

From this it appears that the cosines in the last equation may be distributed into two equal sums; one containing the cosines of all arcs from $a\varphi$ to $a^n\varphi$ inclusively, and the other the remaining cosines; consequently

$$-\frac{1}{2}=\cos.a\varphi+\cos.a^2\varphi+\cos.a^3\varphi\ldots\cos.a^n\varphi;$$

and because $\cos.a^n\varphi=\cos.\varphi$,

$$-\frac{1}{2}=\cos.\varphi+\cos.a\varphi+\cos.a^2\varphi\ldots..+\cos.a^{n-1}\varphi. \quad (1)$$

Let $r=\frac{360°}{n}$; and put

$$e=\cos.r+\sin.r\sqrt{-1};$$

then all the powers of e with indices less than n will be different from one another, and all of them roots of the equation $e^n-1=0$, the solution of which requires the division of the circle into only n, or $\frac{p-1}{2}$, equal parts.

In what follows, we shall have continual occasion to consider the expression

$$\cos.a^{\lambda}\varphi+e^m\cos.a^{\lambda+1}\varphi+e^{2m}\cos.a^{\lambda+2}\varphi\ \ldots\ +e^{(n-1)m}\cos.a^{\lambda+n-1}\varphi;$$

and it will therefore be convenient to adopt an abridged mode of writing it. Now, the expression will be wholly known, and can be constructed when the two indices λ and m are given; and we may therefore denote it by the symbol $f(\lambda, m)$, placing always the index of a before the other. We shall invariably make the index of a positive, and suppose it reduced below n by means of the formula (A). In like manner we shall suppose that the index of e is always reduced below n by

suppressing the multiples of n; and we shall write it sometimes positive and sometimes negative, observing that the negative indices may be always rendered positive by supplying the proper multiples of n; thus,

$$e^{-im} = e^{n-im} = e^{2n-im} = e^{3n-im}, \text{ \&c.}$$

According to the notation just explained, we have

$$f(o,m) = \cos.\varphi + e^{m}\cos.a\varphi + e^{2m}\cos.a^2\varphi\ldots + e^{(n-1)m}\cos.a^{n-1}\varphi,$$

$$f(o,-m) = \cos.\varphi + e^{-m}\cos.a\varphi + e^{-2m}\cos.a^2\varphi\ldots + e^{-(n-1)m}\cos.a^{n-1}\varphi.$$

And because $e^{o} = e^{n} = e^{-n} = 1$, the symbols $f(o,o)$, $f(o,n)$, $f(o,-n)$, will represent the series of cosines in the equation (1); so that we have

$$-\frac{1}{2} = f(o,o) = f(o,n) = f(o,-n).$$

The following formula is no more than a corollary from the preceding notation, viz.

$$e^{-\lambda m}\times f(o,m) = f(\lambda,m). \quad \text{(B)}$$

By means of the trigonometrical formula in common use, any powers and products of the cosines of the arc φ and its multiples may be reduced to a series of terms, containing the like cosines multiplied by given co-efficients. Wherefore, because $\cos.p\varphi = 1$, and likewise because the cosines of all arcs greater than $p\varphi$, $2p\varphi$, $3p\varphi$, &c. may be reduced to the cosines of arcs less than $p\varphi$, it follows that every rational and integral function of $\cos.\varphi$, $\cos.2\varphi$, $\cos.3\varphi$, &c. may be brought under this form of expression, viz.

$$A + B\cos.\varphi + C\cos.2\varphi + D\cos.3\varphi\ldots + N\cos.2n\varphi.$$

Now, if we suppose the function we are considering to be such, that it retains the same value when any of the multiple arcs 2φ, 3φ, &c. is substituted for φ, the transformed expression will be possessed of the same property. But if we actually substitute the arcs 2φ, 3φ, &c. for φ in the foregoing expression, it will become successively

$$A + B\cos.2\varphi + C\cos.4\varphi + D\cos.6\varphi +, \text{\&c.}$$
$$A + B\cos.3\varphi + C\cos.6\varphi + D\cos.9\varphi +, \text{\&c.}$$
&c.

each line containing the same cosines, although in a different order, because the series of arcs is the same when whole circumferences, or the multiples of $p\varphi$, are rejected; and all these expressions cannot have the same value unless $B = C = D =$ &c.; that is, unless the expression be of this form, viz.

$$A + B(\cos.\varphi + \cos.2\varphi + \cos.3\varphi\ldots + \cos.2n\varphi),$$

which, in consequence of what was before proved, is equal to $A - B$. It is therefore demonstrated that every rational and integral function of $\cos.\varphi$, $\cos.2\varphi$, $\cos.3\varphi$, &c., which remains unchanged when any of the multiple arcs 2φ, 3φ, &c. is substituted for φ, has for its value an expression without cosines, and depending only upon the nature of the function.

If we introduce the arcs in geometrical instead of those in arithmetical progression, it is obvious that the substitution of the multiple arcs 2φ, 3φ, &c., for φ, is equivalent to the changing of φ into $a\varphi$, $a^2\varphi$, $a^3\varphi$, &c.; and hence any rational and integral function of the cosines of φ and its multiples, which remains invariable when φ is changed into $a\varphi$, $a^2\varphi$, $a^3\varphi$, &c. is a quantity independent of the cosines, or has its value expressed by a function from which the cosines are eliminated.

What has now been proved will enable us to appreciate the advantage arising from the introduction of the arcs in geometrical in place of those in arithmetical progression, in which principally consists the improvement that this theory owes to M. Gauss. The solution of the problem turns upon finding those functions of $\cos.\varphi$, $\cos.2\varphi$, $\cos.3\varphi$, &c. which have determinate values independent of the cosines; which functions, it has been proved, remain invariable when any of the multiple arcs 2φ, 3φ, &c. is substituted for φ. Now, although the substitution of any multiple arc, in place of the arc itself, always reproduces the same series of cosines, yet the order is irregular, and varies with every different multiple arc; and this circumstance makes it difficult to investigate what change the substitution will effect in a given function. On the other hand, by introducing the arcs in geometrical progression, the same order is still preserved, whatever substitution be made; and by this means every facility possible is obtained for investigating the functions sought.

The following properties are deducible from what has been proved. First, if m, m', m'', &c. be any numbers, none of which is equal to zero, or a multiple of n, and such that their sum is equal to n, or to a multiple of n, the product

$$f(o,m)\times f(o,m')\times f(o,m''), \text{\&c.}$$

will be independent of the cosines of φ and its multiples, or will be an expression containing only the powers of e multiplied by numeral co-efficients.

For by the formula (B) we have

$$e^{-\lambda m}\times f(o,m) = f(\lambda,m)$$
$$e^{-\lambda m'}\times f(o,m') = f(\lambda,m')$$
$$e^{-\lambda m''}\times f(o,m'') = f(\lambda,m'')$$
&c. &c.

Therefore, by multiplying and observing that $e^{-\lambda m}\times e^{-\lambda m'}\times e^{-\lambda m''}\times$, &c. $= 1$, because $\lambda\times(m + m' + m'' +$, &c.) is a multiple of n, we get

$$f(o,m)\times f(o,m')\times f(o,m''), \text{\&c.} = f(\lambda,m)\times f(\lambda,m')\times f(\lambda,m''), \text{\&c.}$$

which shows that the product in question is not altered when φ is changed into $a^{\lambda}\varphi$. Consequently, according to what was before proved, the product is independent of the cosines.

It follows, as a corollary, that the product

$$f(o,m)\times f(o,-m)$$

is independent of the cosines.

Next, if m, m', m'', &c. be any numbers, and $s = m + m' + m''$, &c.; and if neither s nor any of the numbers m, m', m'', &c. be a multiple of n, we shall have

$$f(o,m)\times f(o,m')\times f(o,m''), \text{\&c.} = M\times f(o,s),$$

the quantity M being independent of the cosines, and containing only the powers of e multiplied by numeral co-efficients.

For, by the property already demonstrated, and its corollary, we have

$$f(o,m)\times f(o,m')\times f(o,m'')\times f(o,-s) = A$$
$$f(o,s)\times f(o,-s) = A';$$

A and A′ being quantities independent of the cosines. Therefore, by exterminating $f(o,-s)$, we get

$$f(o,m)\times f(o,m')\times f(o,m'')\times, \text{\&c.} = \frac{A}{A'}.f(o,s).$$

The foregoing properties are the foundations of the theory. But it is not enough to establish the principles by a general demonstration; it is also necessary to be able to compute the numerical values that occur in the application to particular problems. Therefore, supposing that m and m' are two numbers, and $s = m + m'$, none of the

three numbers s, m, m', being a multiple of n, it is proposed to find the value of A in the equation

$$f(o, m) \times f(o, m') = \mathrm{A} \times f(o, s).$$

For this purpose, set down the several terms of $f(o, m')$ in their order; and below them write the terms of $f(o, m)$, placing first any term, as $e^{\lambda m} \cos. a^{\lambda}\varphi$, and the rest in their order, in this manner:

$$\cos.\varphi + e^{m'}\cos.a\,\varphi + e^{2m'}\cos.a^2\varphi \ldots\ldots + e^{(n-1)m'} \cos.a^{n-1}\varphi,$$

$$e^{\lambda m}\cos.a^{\lambda}\varphi + e^{(\lambda+1)m}\cos.a^{\lambda+1}\varphi + e^{(\lambda+2)m}\cos.a^{\lambda+2}\varphi \,.\,. + e^{(\lambda+n-1)m}\cos.a^{\lambda+n-1}\varphi.$$

Now, let every term in the lower line be multiplied into that which stands above it; and, separating the factor $e^{\lambda m}$, which is common to each product, let the symbol $e^{\lambda m} \times \Psi(\lambda)$ represent the sum of all the products; then

$$\Psi(\lambda) = \cos.\varphi\cos.a^{\lambda}\varphi + e^{s}\cos.a\,\varphi\cos.a^{\lambda+1}\varphi \ldots . + e^{(n-1)s}\cos.a^{n-1}\varphi\cos.a^{\lambda+n-1}\varphi.$$

If we repeat this operation, so as to make every term of the lower line stand first in succession, it is evident that, by this means, every term of $f(o, m')$ will be multiplied by all the terms of $f(o, m)$; so that the sum of all the results will be the product sought. We therefore obtain

$$f(o, m) \times f(o, m') = \Psi(o) + e^{m}\Psi(1) + e^{2m}\Psi(2) \ldots + e^{(n-1)m}\Psi(n-1).$$

Let $a^{\lambda} + 1 = w$, and $a^{\lambda} - 1 = w'$; then, because the product of the cosines of the two arcs is equal to half the sum of the cosines of the sum and difference of the two arcs, we shall have

$$\Psi(\lambda) = \frac{1}{2}\left\{\cos.w\varphi + e^{s}\cos.a\,.\,w\varphi + e^{2s}\cos.a^2\,.\,w\varphi +, \&c.\right\} + \frac{1}{2}\left\{\cos.w'\varphi + e^{s}\cos.a\,.\,w'\varphi + e^{2s}\cos.a^2.w'\varphi +, \&c.\right\}.$$

In the first place, when $\lambda = 0$, $w = 2$, $w' = 0$; therefore

$$\Psi(o) = \frac{1}{2}\left\{\cos.2\varphi + e^{s}\cos.a\,.\,2\varphi + e^{2s}\cos.a^2\,.\,2\varphi \ldots . e^{(n-1)s}\cos.a^{n-1}\,.\,2\varphi\right\} + \frac{1}{2}\left\{1 + e^{s} + e^{2s} + e^{3s} \,.\,. + e^{(n-1)s}\right\}.$$

But $e^{n} - 1 = 0$; and hence $e^{ns} - 1 = 0$; or

$$0 = (1 - e^{s}) . \left\{1 + e^{s} + e^{2s} +, \&c. \ldots + e^{(n-1)s}\right\}:$$

and, according to the value assumed for e, the equation $1 - e^{s} = 0$ cannot take place when s is not a multiple of n; wherefore

$$0 = 1 + e^{s} + e^{2s} + e^{3s} \ldots + e^{(n-1)s}.$$

Now, if we put $a^{i} = 2$, we shall get

$$\Psi(o) = \frac{1}{2}f(i, s) = \frac{1}{2}\left\{\cos.\,.a^{i}\varphi + e^{s}\cos.a^{i+1}\varphi + e^{2s}\cos.a^{i+2}\varphi +, \&c.\right\}$$

Wherefore, on account of the formula (B), we finally get

$$\Psi(o) = \frac{1}{2}e^{-is} \times f(o, s).$$

Next, when λ is not equal to zero, let $h(\lambda)$ and $h(\lambda)$ denote the numbers derived from λ by means of the equations

$$a^{\lambda} + 1 = a^{h(\lambda)},$$

$$a^{\lambda} - 1 = a^{h'(\lambda)};$$

then, by substituting $a^{h(\lambda)}$ and $a^{h'(\lambda)}$ for w and w', we shall get

$$\Psi(\lambda) = \frac{1}{2}f\Big(h(\lambda), s\Big) + \frac{1}{2}f\Big(h'(\lambda), s\Big):$$

and, on account of the formula (B),

$$\Psi(\lambda) = \left\{\frac{1}{2}e^{-(\lambda)s} + \frac{1}{2}e^{-h'(\lambda)s}\right\}.f(o, s).$$

Now, collecting all the parts in the expression of $f(o, m) \times f(o, m')$, we shall get these formulæ, viz.:

$$\left.\begin{aligned} &f(o, m) \times f(o, m') = \mathrm{A} \times f(o, s) \\ &\mathrm{A} = \frac{1}{2}e^{-is} + \frac{1}{2}e^{m-h(1)s} + \frac{1}{2}e^{m-h'(1)s} \\ &\qquad + \frac{1}{2}e^{2m-h(2)s} + \frac{1}{2}e^{2m-h'(2)s} \\ &\qquad + \frac{1}{2}e^{3m-h(3)s} + \frac{1}{2}e^{3m-h'(3)s} \\ &\qquad\quad \&c. \qquad\qquad \&c \end{aligned}\right\} \quad (2)$$

As nothing changes in the expression of A except the indices m and s, it may be denoted by the abridged symbol (m, s), in which it is obvious that m' may be substituted for m; so that

$$\mathrm{A} = (m, s) = (m', s).$$

When s is equal to n, and $m' = n - m$, the product in question becomes $f(o, m) \times f(o, -m)$, which has been proved to be a quantity independent of the cosines. In this case, therefore, we shall have

$$f(o, m) \times f(o, -m) = \mathrm{B};$$

B being a quantity from which the cosines are eliminated, and which is now to be investigated.

If, in the foregoing case, we suppose $m' = n - m$ and $s = n$, we shall get

$$f(o, m) \times f(o, -m) = \Psi(o) + e^{m}\Psi(1) + e^{2m}\Psi(2) \ldots e^{(n-1)m}\Psi(n-1):$$

but here, because $e^{s} = e^{n} = 1$, e and its powers disappear from the expression of $\Psi(\mu)$, and we have

$$\Psi(\lambda) = \cos.\varphi\cos.a^{\lambda}\varphi + \cos.a\varphi\cos.a^{\lambda+1}\varphi + \cos.a^2\varphi \times \cos.a^{\lambda+2}\varphi +, \&c.;$$

and, by expanding the products of the cosines, as before,

$$\Psi(\lambda) = \frac{1}{2}\left\{\cos.w\varphi + \cos.a\,.\,w\varphi + \cos.a^2 w\varphi \ldots + \cos.a^{n-1}\,.\,w\varphi\right\} + \frac{1}{2}\left\{\cos.w'\varphi + \cos.a\,.\,w'\varphi + \cos.a^2\,.\,w'\varphi \ldots . + \cos.a^{n-1}\,.\,w'\varphi\right\}.$$

When $\lambda = 0$, $w = 2$, $w' = 0$; therefore

$$\Psi(o) = \frac{1}{2}.\left\{\cos.2\varphi + \cos.a\,.\,2\varphi + \cos.a^2\ 2\varphi \ldots + \cos.a^{n-1}\,.\,2\varphi\right\}$$

$$+\frac{1}{2}\left\{1+1+1+1+1\ldots\ldots\ldots+1\right\}.$$

But no alteration is made in equation (1) when we substitute, instead of the arc φ, any one of its multiples, or, which is the same thing, change φ into $a\varphi$, $a^2\varphi$, &c.; because such substitution or change continually reproduces the same cosines. Thus it appears that the sum of the n cosines in $\Psi(o)$ is equal to $-\frac{1}{2}$; and we have

$$\Psi(o)=\frac{n}{2}-\frac{1}{4}.$$

For every other value of λ, w and w' are neither of them equal to zero, nor to a multiple of n; wherefore, according to what has just been said, the sum of the n cosines in each of the two parts of $\Psi(\lambda)$ is equal to $-\frac{1}{2}$; and thus, when λ is not equal to zero, we have

$$\Psi(\lambda)=\frac{1}{2}\times-\frac{1}{2}+\frac{1}{2}\times-\frac{1}{2}=-\frac{1}{2}.$$

By substituting the values of $\Psi(o)$ and $\Psi(\lambda)$, we get

$$f(o,m)\times f(o,-m)=$$

$$\frac{n}{2}-\frac{1}{4}-\frac{1}{2}\left(e^{m}+e^{2m}+e^{3m}\ldots+e^{(n-1)m}\right).$$

But, as was already proved,

$$-1=e^{m}+e^{2m}+e^{3m}\ldots\ldots+e^{(n-1)m}:$$

wherefore

$$f(o,m)\times f(o,-m)=\frac{n}{2}-\frac{1}{4}+\frac{1}{2}=\frac{2n+1}{4}=\frac{1}{4}p.$$

Now, if we put $k^2=\frac{1}{4}p$, we have finally

$$f(o,m)\times f(o,-m)=k^2\ldots\ldots(3).$$

When n is an even number, it is obvious that $f\left(o,\frac{n}{2}\right)$ $=f\left(o,-\frac{n}{2}\right)$: therefore it follows as a corollary, that in this case

$$f\left(o,\frac{n}{2}\right)=f\left(o,-\frac{n}{2}\right)=\pm k=\pm\frac{1}{2}\sqrt{p}.$$

By applying the equation (2), first to the indices m and m', and then to the indices $n-m$ and $n-m'$, or to m and m' taken negatively, we deduce

$$f(o,m)\times f(o,m')=(m,s)\times f(o,s),$$
$$f(o,-m)\times f(o,-m')=(-m,-s)\times f(o,-s):$$

and by multiplying we shall get, on account of equation 3), this remarkable formula, viz.

$$(m,s)\times(-m,-s)=k^2\ldots(4).$$

By successive applications of the equation (2), we get

$$f(o,1)\times f(o,1)=(1,2)\times f(o,2),$$
$$f(o,1)\times f(o,2)=(1,3)\times f(o,3),$$
$$f(o,1)\times f(o,3)=(1,4)\times f(o,4),$$
&c.

By combining these equations, and writing P for $f(o,1)$, we deduce

$$P^2=(1,2)\,.f(o,2),$$
$$P^3=(1,2)\,.(1,3)\,.f(o,3),$$
$$P^4=(1,2)\,.(1,3)\,.(1,4)\,.f(o,4),$$
&c.

Wherefore, when n is an even number,

$$P^{\frac{n}{2}}=(1,2)\,.(1,3)\,.(1,4)\ldots\ldots\left(1,\frac{n}{2}\right).f\left(o,\frac{n}{2}\right);$$

and, by squaring and observing that, by equation (3), $\left\{f\left(o,\frac{n}{2}\right)\right\}^2=k^2$, we get

$$P^n=(1,2)^2.(1,3)^2.(1,4)^2\ldots\left(1,\frac{n}{2}\right)^2.k^2. \qquad (5).$$

When n is an odd number, we have, in like manner,

$$P^{\frac{n-1}{2}}=(1,2)\,.(1,3)\,.(1,4)\ldots\left(1,\frac{n-1}{2}\right)\times f\left(o,\frac{n-1}{2}\right),$$

$$P^{\frac{n+1}{2}}=(1,2)\,.(1,3)\,.(1,4)\ldots\left(1,\frac{n+1}{2}\right)\times f\left(o,\frac{n+1}{2}\right);$$

but, by equation (3), $f\left(o,\frac{n-1}{2}\right)\times f\left(o,\frac{n+1}{2}\right)=k^2$; wherefore

$$P^n=(1,2)^2.(1,3)^2.(1,4)^2\ldots\left(1,\frac{n-1}{2}\right)^2.\left(1,\frac{n+1}{2}\right).k^2\ldots(6).$$

Again, from the preceding expressions we get

$$f(o,2)=\frac{1}{(1,2)}.P^2;$$

and, by equation (4),

$$f(o,2)=\frac{(-1,-2)}{k^2}.P^2.$$

In like manner,

$$f(o,3)=\frac{(-1,-2)}{k^2}.\frac{(-1,-3)}{k^2}.P^3,$$

$$f(o,4)=\frac{(-1,-2)}{k^2}.\frac{(-1,-3)}{k^2}.\frac{(-1,-4)}{k^2}.P^4,$$
&c.

These formulæ need only be continued till we obtain the value of the function $f\left(o,\frac{n-2}{2}\right)$ when n is even, and of $f\left(o,\frac{n-1}{2}\right)$ when n is odd; the remaining functions $f(o,n-2)$, $f(o,n-3)$, &c. or, which is the same thing, $f(o,-2)$, $f(o-3)$, &c. being derived from the preceding values merely by changing the signs of the different indices of e. Thus, if we write P′ for $f(o,-1)$, we shall have

$$f(o,-2)=\frac{(1,2)}{k^2}.P'^2,$$

$$f(o,-3)=\frac{(1,2)}{k^2}.\frac{(1,3)}{k^2}.P'^3,$$

$$f(o,-4)=\frac{(1,2)}{k^2}.\frac{(1,3)}{k^2}.\frac{(1,4)}{k^2}.P'^4,$$
&c.

Now, ϱ being any number less than n, it has been shown that

$$o=1+e^{\varrho}+e^{2\varrho}+e^{3\varrho}\ldots\ldots+e^{(n-1\varrho)}:$$

and hence if we attend to the nature of functions $f(o,o)$, $f(o,1)$, $f(o,2)$, &c. we shall readily get

$$\cos.a^{\varrho}\varphi=$$

$$\frac{f(o,o)}{n}+\frac{1}{n}.\left\{e^{-\varrho}.f(o,1)+e^{-2\varrho}f(o,2)+e^{-3\varrho}f(o,3)+,\ \&c.\right\};$$

or, by arranging the terms differently, and because

$f(o, o) = -\frac{1}{2}$,

$$\cos. a^{\varrho}\varphi = -\frac{1}{2n} + \frac{1}{n}.\left\{e^{-\varrho} f(o, 1) + e^{\varrho}.f(o, -1)\right\}$$
$$+\frac{1}{n}.\left\{e^{-2\varrho}.f(o, 2) + e^{2\varrho}.f(o, -2)\right\}$$
$$+\frac{1}{n}.\left\{e^{-3\varrho}.f(o, 3) + e^{3\varrho}.f(o, -3)\right\}$$
&c.

and it is to be observed that, when n is even, the last term is the single quantity $\frac{1}{n}\times e^{-\frac{n}{2}\varrho}\times f\left(o, \frac{n}{2}\right)$, which has no corresponding part. Now, this quantity is entirely known. For, since $e^n = 1$, we have $e^{\frac{n}{2}} = e^{-\frac{n}{2}} = \pm 1$; but e has been so assumed, that none of its powers with indices less than n are equal to unit; and, therefore,

$e^{-\frac{n}{2}} = -1$, and $e^{-\frac{n}{2}\varrho} = (-1)^{\varrho}$. Again, by equation (3), $f\left(o, \frac{n}{2}\right) = \pm k$; wherefore we have

$$\frac{1}{n}.e^{-\frac{n}{2}\varrho}.f\left(o, \frac{n}{2}\right) = \frac{1}{n}.(-1)^{\varrho}.\times \pm k.$$

On the whole, the preceding analysis brings us to the following formulæ, which contain the solution of the problem, viz.

when n is even, by equation (5),

$$P^{\frac{n}{2}} = (1, 2).(1, 3).(1, 4)....\left(1, \frac{n}{2}\right)\times \pm k;$$

when n is odd, by equation (6),

$$P^n = (1, 2)^2.(1, 3)^2(1, 4)^2...\left(1, \frac{n-1}{2}\right)^2.\left(1, \frac{n+1}{2}\right).k^2;$$

and by equation (2), $PP' = k^2$.

Finally, by substituting the values of $f(o, 2)$, $f(o, 3)$, &c. $f(o, -2)$, $f(o, -3)$, &c. in the expression of $\cos. a^{\varrho}\varphi$, we get

$$\cos. a^{\varrho}\varphi = -\frac{1}{2n} + \frac{k}{n}.\left\{\frac{e^{-\varrho}P}{k} + \frac{e^{\varrho}P'}{k}\right\}$$
$$+\frac{k}{n}.\left\{\frac{(-1, -2)}{k}.\left(\frac{e^{-\varrho}P}{k}\right)^2 + \frac{(1, 2)}{k}.\left(\frac{e^{\varrho}P'}{k}\right)^2\right\}$$
$$+\frac{k}{n}.\left\{\frac{(-1, -2)}{k}.\frac{(-1, -3)}{k}.\left(\frac{e^{-\varrho}P}{k}\right)^3 + \frac{(1, 2)}{k}.\frac{(1, 3)}{k}\left(\frac{e^{\varrho}P'}{k}\right)^3\right\}$$
$+$, &c.

the series of terms must be continued till the last index of $\frac{e^{-\varrho}P}{k}$ and $\frac{e^{\varrho}P'}{k}$ is $\frac{n-1}{2}$ when n is odd, and $\frac{n-2}{2}$ when n is even; and, in this last case, the quantity $\frac{1}{n}\times(-1)^{\varrho}\times \pm k$, must be added, prefixing to k the same sign that is given to it in the value of $P^{\frac{n}{2}}$.

The solution of the problem is thus reduced to the computation of the functions (1, 2), (1, 3), &c. which requires no more than the substitution of 1 for m, and of 2, 3, 4, &c. successively for s, in the expression of A, equation (2). The half of these functions that have negative indices are deduced from the other half, merely by changing the signs of the several indices of e, or by means of equation (4). All the cosines sought are found by substituting o, 1, 2, 3, &c. successively for ϱ. Although the function P is susceptible of n different values, represented by x, ex, e^2x, &c.; yet the same cosines are deduced from any one of these values. By this means all ambiguity is avoided with regard to the system of values that represent the cosines; but the numerical value that must be attached to each particular cosine remains quite indeterminate, because φ may equally stand for $\frac{360°}{p}$, $2\times\frac{360°}{p}$, $3\times\frac{360°}{p}$, &c. The adaptation of the numerical quantities to the geometrical cosines must be made out by means of their relative magnitudes; the largest number answering to the greatest cosine. But when the value of one cosine is fixed, the rest are unambiguously determined by means of their indices.

In the formula for $\cos. a^{\varrho}\varphi$ all the terms in which two quantities are combined have real values, although their forms are imaginary. But it is not difficult to transform them into equivalent quantities without the imaginary sign.

It is manifest that the functions (1, 2) and (— 1, — 2) are of this form, viz.

$$(1, 2) = A + Be + Ce^2 + De^3 .. + Ne^{n-1},$$
$$(-1, -2) = A + Be^{-1} + Ce^{-2} + De^{-3}... + Ne^{-(n-1)},$$

A, B, C, &c. denoting given co-efficients.

But we have generally

$$e^{\lambda} = \cos. \lambda r + \sin. \lambda r\sqrt{-1},$$
$$e^{-\lambda} = \cos. \lambda r - \sin. \lambda r\sqrt{-1}:$$

wherefore, by combining the two expressions of (1, 2) and (— 1, — 2), we shall readily get

$$\frac{(1, 2) + (-1, -2)}{2} = A + B\cos. r + C\cos. 2r +, \&c.$$
$$\frac{(1, 2) - (-1, -2)}{2} = \quad B\sin. r + C\sin. 2r +, \&c.$$

But, on account of equation (4), we may assume

$$(1, 2) = k(\cos. \beta + \sin. \beta\sqrt{-1}),$$
$$(-1, -2) = k(\cos. \beta - \sin. \beta\sqrt{-1});$$

and, by substituting these values in the last expressions, we get

$$k\cos. \beta = A + B\cos. r + C\cos. 2r +, \&c.$$
$$k\sin. \beta = \quad B\sin. r + C\sin. 2r +, \&c.$$

by which means the arc β is determined without ambiguity, since both its sine and cosine are ascertained. In like manner are determined the several arcs in the formulæ

$$(1, 3) = k(\cos. \beta' + \sin. \beta'\sqrt{-1}),$$
$$(-1, -3) = k(\cos. \beta' - \sin. \beta'\sqrt{-1}),$$
$$(1, 4) = k(\cos. \beta'' + \sin. \beta''\sqrt{-1}),$$
$$(-1, -4) = k(\cos. \beta'' - \sin. \beta''\sqrt{-1}),$$
&c.

Again, because $PP' = k^2$, we may assume

$$P = k(\cos. w + \sin. w\sqrt{-1}),$$
$$P' - k(\cos. w - \sin. w\sqrt{-1}),$$

And if these values, and the similar values of the functions (1, 2), (1, 3), &c. be substituted in the value of $P^{\frac{n}{2}}$, we shall readily deduce, when n is an even number,

$$\frac{n}{2}\cdot w = \beta + \beta' + \beta'' +, \text{\&c.}$$

When n is an odd number, we must separate the function $\left(1, \frac{n+1}{2}\right)$ from the rest, by supposing $\left(1, \frac{n+1}{2}\right) = k$ $(\cos.\gamma + \sin.\gamma\sqrt{-1})$:
and then, by means of equation (6), we shall easily obtain

$$nw = 2(\beta + \beta' + \beta'' +, \text{\&c.}) + \gamma.$$

The two last formulæ determine the arc w; and we likewise have

$$\frac{e^{-\varrho}P}{k} = \cos.(w - \varrho\tau) + \sin.(w - \varrho\tau)\sqrt{-1},$$

$$\frac{e^{\varrho}P'}{k} = \cos.(w - \varrho\tau) - \sin.(w - \varrho\tau)\sqrt{-1};$$

and, by putting $w^{(\varrho)} = w - \varrho\tau$,

$$\frac{e^{-\varrho}P}{k} = \cos.w^{(\varrho)} + \sin.w^{(\varrho)}\sqrt{-1},$$

$$\frac{e^{\varrho}P}{k} = \cos.w^{(\varrho)} - \sin.w^{(\varrho)}\sqrt{-1}.$$

Finally, by substituting the different values exhibited above in the formula for $\cos.a^{\varrho}\phi$, we shall get

$$\begin{aligned}\cos.a^{\varrho}\phi = -\frac{1}{2n} &+ \frac{2k}{n}.\cos.w^{(\varrho)} \\ &+ \frac{2k}{n}.\cos.(2w^{\varrho} - \beta) \\ &+ \frac{2k}{n}.\cos.(3w^{(\varrho)} - \beta - \beta') \\ &+ \frac{2k}{n}.\cos.(4w^{(\varrho)} - \beta - \beta' - \beta'') \\ &\text{\&c.}\end{aligned}$$

the series of terms being continued till all the arcs β, β', β'', &c. are taken in when n is odd; and till they are all taken in except the last when n is even, in which case also the quantity $(-1)^{\varrho}.\frac{k}{n}$ must be added.

By the preceding analysis the division of the circle into p equal parts is accomplished, when p is a prime number, by dividing a given arc into n or $\frac{p-1}{2}$ equal parts. And this conclusion agrees with the general proposition of M. Gauss. For the nth part of a given arc is found by bisecting as often as n is divisible by 2, trisecting as often as it is divisible by 3, and so on. When n is a power of two, as in the case of the polygon of 17 sides, the solution is effected by repeated bisections, and thus comes under the elementary geometry. Supposing the division of the circle to be accomplished, we must further resolve the quadratic equation

$$x + \frac{1}{x} = 2\cos..\frac{\lambda \times 360°}{p},$$

in order to find the roots of the binomial equation $x^p - 1 = 0$.

The following examples are subjoined for the sake of illustrating the method of calculation. And, in the first place, we may take the case of $p = 11$ equivalent to finding the roots of the equation $x^{11} - 1 = 0$, which was first solved by Vandermonde, and has been considered both by Lagrange and Legendre. Here, $n = 5$; $k = \frac{1}{2}\sqrt{11}$;
$\tau = \frac{360°}{5} = 72°$ $= \cos.\tau + \sin.\tau\sqrt{-1}$; and, as 2 is a primitive root of 11, we may suppose $a = 2$. In order to find the numbers $h(\lambda)$ and $h'(\lambda)$, write down the series 1, 2, 3, &c. as far as n or 5; and, above each number, write the power of a equal to it when the multiples of 11 are rejected, taking always the least remainder, whether positive or negative: thus,

$$\begin{array}{ccccc} a^0 & a^1 & a^3 & a^2 & a^4 \\ 1 & 2 & 3 & 4 & 5. \end{array}$$

In this arrangement of the powers of a, it is evident that, λ denoting any index, $h(\lambda)$ is the next on the right hand, and $h'(\lambda)$ the next on the left hand: we have, therefore,

$$\begin{array}{cc} \multicolumn{2}{c}{i = 1,} \\ h(1) = 3, & h'(1) = 0, \\ h(2) = 4, & h'(2) = 3, \\ h(3) = 2, & h'(3) = 1, \\ h(4) = 4, & h'(4) = 2. \end{array}$$

Now, substitute these numbers in the expression of A, equation (2), and likewise put $m = 1$; then

$$\begin{aligned}A = \frac{1}{2}e^{-s} &+ \frac{1}{2}e^{1-3s} + \frac{1}{2}e \\ &+ \frac{1}{2}e^{2-4s} + \frac{1}{2}e^{2-3s} \\ &+ \frac{1}{2}e^{3-2s} + \frac{1}{2}e^{3-s} \\ &+ \frac{1}{2}e^{4-4s} + \frac{1}{2}e^{4-2s}.\end{aligned}$$

In order to find (1, 2) and (1, 3), we have only to substitute 2 and 3 for s in the expression of A; hence

$$(1, 2) = 1 + 2e + \frac{1}{2}e^3 + e^4,$$

$$(1, 3) = 1 + \frac{1}{2}e + 2e^2 + e^3;$$

which values will, in this case, be rendered somewhat more simple by combining them with the equation $0 = 1 + e + e^2 + e^3 + e^4$: and thus we get

$$(1, 2) = e - e^2 - \frac{1}{2}e^3 = m,$$

$$(1, 3) = e^2 - e^4 - \frac{1}{2}e = \mu.$$

The functions $(-1, -2)$ and $(-1, -3)$ are found by subtracting the indices of e in the values of (1, 2) and (1, 3) from 5, which is equivalent to changing the signs of the indices; therefore

$$(-1, -2) = e^4 - e^3 - \frac{1}{2}e^2 = m,$$

$$(-1, -3) = e^3 - e - \frac{1}{2}e^4 = \mu'.$$

And it will be found, by actually multiplying, that

$$mm' = k^2 = \frac{11}{4} \text{ and } \mu\mu' = k^2 = \frac{11}{4}.$$

These values being found, we have, according to the foregoing method,

$$P^5 = (1, 2)^2 \cdot (1, 3) \cdot k^2 = m^2\mu \cdot k^2,$$

$$P'^5 = \frac{k^{10}}{P^5} = (-1, -2)^2.(-1, -3).k^2 = m'^2\mu'.k^2;$$

and hence $\frac{P}{k} = \frac{1}{k}(m^2\mu.k^2)^{\frac{1}{5}}$,

$$\frac{P'}{k} = \frac{1}{k}(m'^2\mu'.k^2)^{\frac{1}{5}},$$

$$\frac{m'}{k}\cdot\frac{P^2}{k^2} = \frac{1}{k}(m'\mu^2.k^2)^{\frac{1}{5}}$$

$$\frac{m}{k}\cdot\frac{P'^2}{k^2} = \frac{1}{k}(m\mu'^2.k^2)^{\frac{1}{5}}$$

wherefore we have

$$\cos. a^{\varrho}\phi = -\frac{1}{10} + \frac{e^{-\varrho}}{5}\cdot(m^2\mu\cdot k^2)^{\frac{1}{5}} + \frac{e^{\varrho}}{5}\cdot(m'^2\mu'\cdot k^2)^{\frac{1}{5}}$$
$$+\frac{e^{-2\varrho}}{5}\cdot(m'\mu^2\cdot k^2)^{\frac{1}{5}} + \frac{e^{2\varrho}}{5}\cdot(m\mu'^2\cdot k^2)^{\frac{1}{5}}.$$

If, in this expression, we make $\varrho=0$, and substitute the numerical values of k^2, and of e and its powers, in the quantities under the radical sign, the result will coincide with the formula of Vandermonde, and with the calculation of Lagrange.

The expression just found being imaginary, if it be required to reduce it to a form fit for calculation, we must begin with substituting the values of e and its powers in m and μ: then

$$m=(\cos.\tau-\cos.2\tau-\frac{1}{2}\cos.3\tau)$$
$$+(\sin.\tau-\sin.2\tau-\frac{1}{2}\sin.3\tau)\cdot\sqrt{-1},$$
$$\mu=(\cos.2\tau-\cos.4\tau-\frac{1}{2}\cos.\tau)$$
$$+(\sin.2\tau-\sin.4\tau-\frac{1}{2}\sin.\tau)\cdot\sqrt{-1}.$$

Now, $\cos.\tau=\cos.4\tau=-\frac{1}{4}+\frac{1}{4}\sqrt{5}$, and $\cos.2\tau=\cos.3\tau=-\frac{1}{4}-\frac{1}{4}\sqrt{5}$; also $\sin.\tau=-\sin.4\tau$, and $\sin.2\tau=-\sin.3\tau$: wherefore

$$m=(\cos.\tau-\frac{3}{2}\cos.2\tau)+(\sin.\tau-\frac{1}{2}\sin.2\tau)\cdot\sqrt{-1},$$
$$\mu=(\cos.2\tau-\frac{3}{2}\cos.\tau)+(\sin.2\tau+\frac{1}{2}\sin.\tau)\cdot\sqrt{-1}.$$

Again,

$$m=k(\cos.\beta+\sin.\beta\cdot\sqrt{-1}),$$
$$\mu=k(\cos.\gamma+\sin.\gamma\sqrt{-1});$$

consequently

$$\cos.\beta=\frac{1}{k}(\cos.\tau-\frac{3}{2}\cos.2\tau)=\frac{1+5\sqrt{5}}{4\sqrt{11}},$$
$$\sin.\beta=\frac{1}{k}(\sin.\tau-\frac{1}{2}\sin.2\tau),$$
$$\cos.\gamma=\frac{1}{k}(\cos.2\tau-\frac{3}{2}\cos.\tau)=\frac{-1+5\sqrt{5}}{4\sqrt{11}},$$
$$\sin.\gamma=\frac{1}{k}(\sin.2\tau+\frac{1}{2}\sin.\tau).$$

Hence

$$\beta=23^\circ\ 20'\ 46'',$$
$$\gamma=140\ \ 7\ \ 6\tfrac{1}{2},$$
$$5\omega=2\beta+\gamma=186\ \ 48\ \ 38\tfrac{1}{2},$$
$$\omega=37\ \ 21\ \ 44,$$
$$\omega^{(\varrho)}=\omega-\varrho\times72^\circ:$$
$$\cos.a^{\varrho}\phi=-\frac{1}{10}+\frac{\sqrt{11}}{5}\cdot\left\{\cos.\omega^{(\varrho)}+\cos.(2\omega^{\varrho}-\beta)\right\}.$$

By making ϱ successively equal to 0, 1, 2, 3, 4, the formula will give all the ten cosines of a polygon of eleven sides inscribed in a circle; because $\cos.\frac{360^\circ}{11}=\cos.10\cdot\frac{360^\circ}{11}$, $\cos.2\cdot\frac{360^\circ}{11}=\cos.9\cdot\frac{360^\circ}{11}$, &c. It determines also the order of the arcs to which the numerical quantities belong; so that when the value of one cosine is fixed, the values of all the rest are likewise ascertained.

This last formula coincides with the calculation of Legendre.

The next example shall be the case of $p=17$. Then, $n=8$, $k=\frac{1}{2}\sqrt{17}$, $\tau=\frac{360^\circ}{8}=45^\circ$, and $e=\cos.\tau+\sin.\tau\sqrt{-1}$; and, 3 being one of the primitive roots of 17, we may take $a=3$. Now, arranging the powers of a as in the last example, we have

$$a^0,\ a^6,\ a^1\ a^4,\ a^5,\ a^7,\ a^3,\ a^2$$
$$1,\ 2,\ 3,\ 4,\ 5,\ 6,\ 7,\ 8:$$

and hence,

$$i=6$$

$h(1)=4,$	$h'(1)=6,$
$h(2)=2,$	$h'(2)=3,$
$h(3)=2,$	$h'(3)=7,$
$h(4)=5,$	$h'(4)=1,$
$h(5)=7,$	$h'(5)=4,$
$h(6)=1,$	$h'(6)=0,$
$h(7)=3,$	$h'(7)=5.$

By substituting these numbers in the expression of A, and likewise by putting $m=1$, we get

$$\mathrm{A}=\frac{1}{2}e^{-6s}+\frac{1}{2}e^{1-4s}+\frac{1}{2}e^{1-6s}$$
$$+\frac{1}{2}e^{2-2s}+\frac{1}{2}e^{2-3s}$$
$$+\frac{1}{2}e^{3-2s}+\frac{1}{2}e^{3-7s}$$
$$+\frac{1}{2}e^{4-5s}+\frac{1}{2}e^{4-s}$$
$$+\frac{1}{2}e^{5-7s}+\frac{1}{2}e^{5-4s}$$
$$+\frac{1}{2}e^{6-s}+\frac{1}{2}e^{6}$$
$$+\frac{1}{2}e^{7-3s}+\frac{1}{2}e^{7-5s}.$$

In order to have the functions (1, 2), (1, 3), (1, 4), nothing more is necessary than to substitute 2, 3, 4 for s in the expression of A: then, observing that $e+e^5=0$, $e^2+e^6=0$, $e^3+e^7=0$, we readily get

$$(1,2)=\frac{3}{2}e^4+e^7+e^5=-\frac{3}{2}-\sqrt{-2}=-m,$$
$$(1,3)=1+\frac{1}{2}e^4+2e^6=\frac{1}{2}-2\sqrt{-1}=n,$$
$$(1,4)=\frac{3}{2}+e+e^3=\frac{3}{2}+\sqrt{-2}=m:$$

and hence

$$(-1,-2)=\frac{3}{2}e^4+e+e^3=-\frac{3}{2}+\sqrt{-2}=-m',$$
$$(-1,-3)=1+\frac{1}{2}e^4+2e^2=\frac{1}{2}+2\sqrt{-1}=n',$$
$$(-1,-4)=\frac{3}{2}+e^7+e^5=\frac{3}{2}-\sqrt{-2}=m'.$$

These values being found, we next have

$$\mathrm{P}^4=(1,2)\cdot(1,3)\cdot(1,4)\cdot f(0,4);$$
$$f(0,4)=\pm k;$$

therefore, making $f(0,4)=-k$,

$$\mathrm{P}^4=m^2nk,$$
$$\mathrm{P}'^4=\frac{k^8}{\mathrm{P}^4}=m'^2n'k;$$

and hence

$$\frac{1}{k}\mathrm{P}=\frac{1}{k}(m^2nk)^{\frac{1}{4}};\ \frac{1}{k}\cdot\mathrm{P}'=\frac{1}{k}(m'^2n'k)^{\frac{1}{4}};$$

$$-\frac{m'}{k}\cdot\frac{P^2}{k^2}=-\frac{1}{k}\cdot\sqrt{nk}\,;\ -\frac{m}{k}\cdot\frac{P^2}{k^2}=-\frac{1}{k}\sqrt{n'k}\,;$$

$$-\frac{m'}{k}\cdot\frac{n'P^3}{kk^3}\cdot=-\frac{1}{k}(m^2n'k)^{\frac{1}{4}}\,;\ -\frac{m}{k}\cdot\frac{n}{k}\cdot\frac{P'^3}{k^3}$$

$$=-\frac{1}{k}(m'^2nk)^{\frac{1}{4}}\,;$$

$$\cos.\ a^{\varrho}\varphi=-\frac{1}{16}-(-1)^{\varrho}\cdot\frac{\sqrt{17}}{16}$$

$$+\frac{1}{8}\cdot\left\{e^{-\varrho}(m^2nk)^{\frac{1}{4}}+e^{\varrho}(m'^2n'k)^{\frac{1}{4}}\right\}$$

$$-\frac{1}{8}\cdot\left\{e^{-2\varrho}(nk)^{\frac{1}{2}}+e^{2\varrho}(n'k)^{\frac{1}{2}}\right\}$$

$$-\frac{1}{8}\left\{e^{-3\varrho}(m^2n'k)^{\frac{1}{4}}+e^{3\varrho}(m'^2nk)^{\frac{1}{4}}\right\}.$$

In order to reduce this expression, we shall put

$$\varphi(\varrho)=e^{-2\varrho}\sqrt{nk}+e^{2\varrho}\sqrt{n'k},$$

$$\Psi(\varrho)=e^{-\varrho}(m^2nk)^{\frac{1}{4}}+e^{\varrho}(m'^2n'k)^{\frac{1}{4}}$$

$$-e^{-3\varrho}(m^2n'k)^{\frac{1}{4}}-e^{3\varrho}(m'^2nk)^{\frac{1}{4}}.$$

And because $e^4=e^{-4}=-1$, we get $e^{6\varrho}=e^{-2\varrho}=(-1)^{\varrho}\cdot e^{2\varrho}$, and $e^{-6\varrho}=e^{2\varrho}=(-1)^{\varrho}\cdot e^{-2\varrho}$. Wherefore, by squaring,

$$\left\{\varphi(\varrho)\right\}^2=2k^2+(-1)^{\varrho}\cdot k,$$

$$\left\{\Psi(\varrho)\right\}^2=4k^2-6k(-1)^{\varrho}+3\varphi(\varrho)-2k\cdot\varphi(\varrho)\cdot(-1)^{\varrho}.$$

Now, in the formula for cos. $a^{\varrho}\varphi$, viz. cos. $a^{\varrho}\varphi=-\frac{1}{16}-(-1)^{\varrho}\cdot\frac{\sqrt{17}}{16}-\frac{1}{8}\varphi(\varrho)-\frac{1}{8}\Psi(\varrho)$, if we change ϱ into $\varrho+4$, no alteration will be produced, except that $\Psi(\varrho)$ will change its sign; for it is obvious that

$$\Psi(\varrho+4)=e^4\cdot\Psi(\varrho)=-\Psi(\varrho).$$

Hence we readily deduce these two equations, viz.

$$\frac{1}{2}(\cos.\ a^{\varrho}\varphi+\cos.\ a^{\varrho+4}\varphi)=-\frac{1}{16}-(-1)^{\varrho}\cdot\frac{\sqrt{17}}{16}-\frac{1}{8}\varphi(\varrho),$$

$$\frac{1}{4}(\cos.\ a^{\varrho}\varphi-\cos.\ a^{\varrho+4}\varphi)^2=\frac{1}{64}\times\left\{\Psi(\varrho)\right\}^2.$$

If we suppose $\varrho=0$, then

$$\left\{\varphi(0)\right\}^2=2k^2+k;$$

wherefore

$$\frac{1}{2}(\cos.\ \varphi+\cos.\ a^4\varphi)=-\frac{1}{16}-\frac{\sqrt{17}}{16}-\frac{1}{8}\sqrt{2k^2+k},$$

$$\frac{1}{4}(\cos.\ \varphi-\cos.\ a^4\varphi)^2=\frac{1}{64}\cdot\left\{4k^2-6k-(2k-3)\times\sqrt{2k^2+k}\right\}.$$

And, when $\varrho=2$, then

$$\varphi(2)=e^4\cdot\varphi(0)=-\varphi(0);$$

wherefore

$$\frac{1}{2}(\cos.\ a^2\varphi+\cos.\ a^6\varphi)=-\frac{1}{16}-\frac{\sqrt{17}}{16}+\frac{1}{8}\sqrt{2k^2+k},$$

$$\frac{1}{4}(\cos.\ a^2-\cos.\ a^6\varphi)^2=\frac{1}{64}\cdot\left\{4k^2-6k+(2k-3)\times\sqrt{2k^2+k}\right\}$$

Next, suppose $\varrho=1$, then

$$\left\{\varphi(1)\right\}^2=2k$$

wherefore

$$\frac{1}{2}(\cos.\ a\varphi+\cos.\ a^5\varphi)=-\frac{1}{16}+\frac{\sqrt{17}}{16}+\frac{1}{8}\sqrt{2k^2-k},$$

$$\frac{1}{4}(\cos.\ a\varphi-\cos.\ a^5\varphi)^2=\frac{1}{64}\cdot\left\{4k^2+6k+(2k+3)\sqrt{2k^2-k}\right\}:$$

and, finally, making $\varrho=3$, we get

$$\varphi(3)=e^4\times\varphi(1)=-\varphi(1);$$

wherefore

$$\frac{1}{2}(\cos.\ a^3\varphi+\cos.\ a^7\varphi)=-\frac{1}{16}+\frac{\sqrt{17}}{16}-\frac{1}{8}\sqrt{2k^2-k},$$

$$\frac{1}{4}(\cos.\ a^3\varphi-\cos.\ a^7\varphi)^2+\frac{1}{64}\cdot\left\{4k^2+6k-(2k+3)\sqrt{2k^2-k}\right\}.$$

These formulæ enable us to find the numerical values of all the cosines sought; observing always that φ is indeterminate, and varies with the primitive root from which the solution is deduced. (J. I.)

EQUATOR (*æquare, to make equal*), in *Astronomy* and *Geography*, a great circle of the sphere, equally distant from the two poles of the world, or having the same poles as the world. It is called *equator* because when the sun is in it the days and nights are *equal;* whence also it is denominated the *equinoctial*; and when drawn on maps, planispheres, or globes, it is called the *equinoctial line*, or simply *the line.* Every point in the equator is 90 degrees or a quadrant's distance from the poles of the world; and hence the equator divides the sphere into two equal hemispheres, in one of which is the northern, and in the other the southern pole. See Astronomy.

EQUATORIAL, pertaining to the equator.

Equatorial, an astronomical instrument for directing a telescope at once to any celestial object whose right ascension and declination are known, and for keeping the object in view for any length of time notwithstanding the diurnal motion. See Astronomy, vol. iv., p. 53.

EQUERRY (Fr. *écurie, a stable*), an officer who has the care and management of the horses of a king or prince.

The equerries of the royal household in England are certain officers under the Master of the Horse, the first of whom is styled chief equerry and clerk-marshal, and has a salary of L.500 a-year. The royal equerries in rotation attend the sovereign when riding abroad in state. Other members of the royal family are likewise attended by equerries.

EQUES Auratus, a knight-bachelor; styled *auratus* because anciently knights alone had the privilege of adorning their armour with gold. In law its equivalent term is *miles* or *chevalier.*

EQUESTRIAN (Lat. *eques, a horseman*, from *equus, a horse*), pertaining to horses or to horsemanship.

EQUIANGULAR, having equal angles; as a square, an equilateral triangle, &c.

EQUIDISTANT, being at an equal distance from some fixed point or place.

EQUILATERAL, having all the sides equal; as an equilateral triangle, a square, &c.

EQUILIBRIUM (Lat.), equipoise, equality of weight, balance; as when the two ends of a lever or a balance,

charged with an equal weight, maintain an even or level position, parallel to the horizon. See MECHANICS.

EQUIMULTIPLE, in *Arithmetic* and *Geometry*, a number or quantity multiplied by the same number or quantity. Hence equimultiples are always in the same ratio to each other as the simple quantities before multiplication. Thus, if 6 and 8 are multiplied by 4, the equimultiples 24 and 32 will be to each other as 6 to 8.

EQUINOCTIAL (*æquus, equal*, and *nox, night*), in *Astronomy*, a great circle of the sphere, under which the equator moves in its diurnal motion.

The equinoctial, or æquinoctial line, is ordinarily confounded with the equator; but there is a difference, the equator being moveable, and the equinoctial immoveable; the equator being drawn about the convex surface of the sphere, and the equinoctial on the concave surface of the *magnus orbis*.

When the sun, in its progress through the ecliptic, comes to this circle, the days and nights are equal all over the globe. The equinoctial, then, is the circle which the sun describes, or appears to describe, at the time of the equinoxes; that is, when the length of the day is everywhere equal to that of the night, which happens twice a-year, viz., about the 21st of March and the 23d of September.

EQUINOCTIAL *Points*, the two points in which the equator and ecliptic intersect each other. The one, being in the first point of Aries, is called the *vernal point* or *equinox;* the other, in the first point of Libra, is denominated the *autumnal point* or *equinox*. See ASTRONOMY, vol. iv., p. 12.

EQUINOCTIAL *Dial*, a dial of which the plane is parallel to that of the equinoctial.

EQUINOX, in *Astronomy*, the time when the sun enters one of the equinoctial points.

The equinoxes happen when the sun is in the equinoctial circle, and the days are equal to the nights throughout the world, which is the case twice a-year; namely, about the 21st of March and the 23d of September, the former being called the vernal and the latter the autumnal equinox. See ASTRONOMY, vol. iv., p. 14; and PRECESSION OF THE EQUINOXES.

EQUIPOLLENCE (*æquus, equal*, and *pollens*, part. of *pollere, to be powerful*), in *Logic*, an equivalence between two or more propositions; that is, when they signify the same thing though differently expressed. Such terms or propositions are said to be *equipollent*.

EQUIRIA, in *Antiquity*, a festival said to have been instituted by Romulus, and celebrated with horse-races in the Campus Martius on the 27th of February, in honour of Mars.

EQUITES, an order of men in the commonwealth of Rome, to which we can furnish no exact parallel in modern times. They seem, indeed, to have resembled in some degree the gentry of England; with this difference, however, that they enjoyed peculiar privileges, and were more of a separate caste than any body of men which can now be pointed out. Their origin goes back to the earliest times of Roman history, though we can perceive, even from the legendary statements of Livy and Dionysius, that their constitution and mode of selection had been changed in the course of ages. During the reign of the kings they evidently appear to have been of noble birth, the younger branches of patrician families. This we may infer from the statement of Polybius (vi. 20), when he says that the knights *now* are chosen according to fortune; evidently intimating that their selection had depended on a different principle at a previous period. Romulus is said to have divided them into three centuries; and the very names of Ramnenses, Titienses, and Luceres, by which he designated them, point out distinctly their high origin. Both Tullus Hostilius and Tarquinius added to their number; but it was Servius Tullius (576 B.C.) who first organized them into a distinct body, and compelled the state to contribute annually to their maintenance. It is difficult to perceive in what way we are to explain the statement of Livy (i. 43), that the sum of ten thousand pounds of brass was given to each for the purchase of a horse; an enormous sum when compared with that at which oxen and sheep were rated in the table of penalties. They were bound, of course, to be provided with a noble steed, and may have been obliged to replace it if lost through any casualty in war. Its accoutrements, too, and a slave to take charge of it, were possibly all included in this large sum. But whether, when the censor ordered the knight to sell his horse, it was the intention that the outfit money should be refunded to the state, we have now no means of determining. Livy tells us also that a tax of two thousand pounds of brass was imposed on each *vidua*, to maintain a knight's horse. This certainly sounds very strange, for it seems inconceivable that there should have been such a large number of rich widows; and even though we understand by the word *vidua* every single woman, maiden as well as widow, we do not think that we thereby get out of the difficulty.

As early as 400 B.C. we find that a certain fortune was required to enable a man to be raised to the rank of eques. In that year, at the siege of Veii, we are told that those who possessed the requisite fortune, but to whom horses had not been assigned, offered to provide these at their own expense. This proposal was accepted; and then it was, according to Livy (v. 7), that they first received regular pay. In 303 B.C. the censors Q. Fabius and P. Decius established a law by which it was ordained that every fifth year a procession of the equites should take place, and that those who had misconducted themselves should be degraded from their rank. They now evidently became a very powerful body in the state; yet in 186 B.C. we find it allowed as a reward to P. Æbutius, that the censor should not assign him a public horse, and thereby compel him to serve as an eques against his will. This proves that the duties must have been burdensome, and regarded by many with distaste. In the later times of the republic they increased in power and consequence, when the judicial functions were transferred from the senate to the body of equites by the Sempronian law, passed by C. Gracchus about 123 B.C.; and a short time afterwards they became the farmers of the public revenues, by which they were enabled to amass immense riches. They were deprived of their judicial powers by Sylla; but they now possessed too much influence in the state to be excluded from the higher and more dignified offices. After his death they were admitted to their former power, which, however, they shared with the senate.

Towards the end of the republic, and under the emperors, the fortune requisite for an eques seems to have been four hundred sestertia, equal to about L.3229 of our money; and even at this time knights' horses were furnished by the state, as we find by ancient inscriptions of that period. (Gruter. *Inscrip.* 404.)

EQUITY (*æquitas*), even-handed justice; right; the impartial distribution of justice; the treating of others according to reason and justice, or in that way to which, by the natural law, that is, in strict justice, they are entitled.

Equity or justice is personified as a female divinity, bearing in one hand a sword, and in the other a balance.

In *Jurisprudence*, equity is defined by Grotius to be "the correction of that wherein the law (by reason of its generality) is deficient." "Equity," says Blackstone, "in its true and genuine meaning, is the soul and spirit of all law; positive law is construed, and rational law is made by it. In this respect equity is synonymous with justice; in that, to the true and sound interpretation of the rule."

Courts of Equity are distinguished from Courts of Law, in that the former have jurisdiction in cases where the proper remedy cannot be found, or cannot be administered to

the full extent of the relative rights of all parties in the courts of common law, in which proceedings can be carried on and decisions given only according to certain prescribed forms. The rights secured by the former are termed *legal;* those by the latter, *equitable.* Though equity, if not in name, at least in substance, must have a place in every rational system of jurisprudence, yet it is impossible that any code, however minute and particular, should embrace or provide for the infinite variety of human affairs, or should furnish rules applicable to every case.

The most general description of a court of equity is, that it has jurisdiction in cases where a plain, adequate, and complete remedy cannot be had in the common law courts. It is not confined or limited in its modes of relief, like courts of law, but grants relief to all parties in cases where they have rights *ex æquo et bono,* and modifies and fashions that relief according to circumstances. The jurisdiction of a court of equity is sometimes concurrent with that of courts of law, and sometimes it is exclusive. The most common exercise of concurrent jurisdiction is in cases of accident, fraud, mistake, &c. In many cases falling under these heads courts of law cannot afford redress; in others they can, though not always in so adequate a manner. It exercises exclusive jurisdiction in all cases of merely equitable rights, that is, such as are not recognized in courts of law. Most cases of trust and confidence come under this head. (See Justice Story's *Commentaries on Equity Jurisprudence;* Fonblanque *On Equity;* Maddock's *Treatise on Equity;* Lord Redesdale's *Treatise on Equity Pleadings.*)

The equity judges are the Lord Chancellor, the Master of the Rolls, the two Lords Justices of the Court of Appeal in Chancery, and the three Vice-Chancellors. The Lord Chancellor is a political officer of the highest importance and influence. He is a privy-councillor, and at the head of the judges and of the law. His duration of office, however, is dependent upon that of the ministry of which he is a member. The Master of the Rolls holds his appointment for life; and the Vice-Chancellors and Lords Justices of Appeal, by act 13th Will. III., cap. 2, during good conduct.

The salary of the Lord Chancellor is L.10,000; that of the Master of the Rolls and the Lords Justices of Appeal, L.6000 each; and that of the Vice-Chancellors, L.5000.

EQUIVALENT, equal in value, force, or effect, to something else.

Chemical Equivalents. See Chemistry, § *Combination of Definite Proportions,* vol. vi., p. 441.

EQUULEUS, or Eculeus (dim. of *equus, a horse*), in *Antiquity,* an instrument of torture used for extorting confession from slaves and criminals. (See Cic. *pro Milo.*) This or a similar instrument was also made use of against the Christians.

This instrument has been described as made of wood, with holes at certain distances, and provided with a screw, by means of which the victim was stretched to the third, fourth, or fifth hole, his arms and legs being fastened to the equuleus with cords. He was thus stretched till his bones were dislocated, and further tortured by the application of red-hot plates and a clawed instrument called *ungula.*

Equuleus, Equiculus, and Equus Minor, the horse's head, a constellation of the northern hemisphere. See Astronomy.

EQUUS. See Horse, and index to Mammalia.

ERA. See Æra, and Chronology.

ERANARCHA, among the ancient Greeks, a public officer who presided over the distribution of alms and provisions allotted for the poor. Cornelius Nepos, in his Life of Epaminondas, describes the office thus: When any person was reduced to poverty, taken captive, or had a daughter to marry and could not effect that object for want of money, the eranarcha called an assembly of friends and neighbours, and taxed each according to his means to contribute towards the relief of such person or persons.

ERASISTRATUS, a physician of Iulus, a town of the island of Ceos, now Zea, off Cape Sunium, in Attica, flourished from about 300 to 258 B.C. According to one account, he was grandson of Aristotle, his mother being daughter of that philosopher. He seems to have been in high favour at the court of Seleucus Nicator, whose son Antiochus he recovered from a dangerous illness in the following manner: Antiochus was violently enamoured of his mother-in-law Stratonice, and he determined to rid himself of life. His physician, Erasistratus, by close observation, perceived that Stratonice was the cause of his illness; and having informed his father, that monarch allowed his son to marry her. A similar story is told of many ancient physicians.

In his old age he renounced the practice of medicine, and, retiring to Alexandria, devoted himself more particularly to the study of anatomy. His description of the brain and nerves is said to have been far more correct than that of any of his predecessors. He was the founder of a school of medicine, which flourished long at Smyrna, and the disciples of which continued to exist till the time of Galen. Of his works only a few fragments remain, in the quotations of Galen and other writers.

ERASMUS, Desiderius, was born at Rotterdam on the 28th of October 1467.[1] His father, who bore the name of Gerard, was an inhabitant of Tergou; his mother, named Margaret, was the daughter of Peter, a physician of Sevenbergen. He had an elder brother, called Peter, but their parents were never married, though a promise of marriage is said so have preceded their intercourse. The brothers of Gerard, who was a young man of wit and gaiety, endeavoured to secure his patrimony by compelling him to become an ecclesiastic. Finding himself very uncomfortable in his own country, he went to Rome, where he employed himself in transcribing ancient authors; for the recent invention of printing had not entirely superseded this more slow and expensive method of multiplying copies of books. In the mean time, his relations sent him a false account of Margaret's death; and his grief for her supposed loss led him to adopt a resolution to which he could not be impelled by their importunities. Having taken orders, he returned to Holland, and found that she was still alive; but he could not now fulfil his promise of marrying her, and she never would marry another, nor did she continue to cohabit with him after he became a priest. He did not neglect the education of a son who was destined to reflect so much lustre on the age and nation to which he belonged. The boy was sent to school when he was only four years old; and, when he was still very young, his musical voice procured him a place among the choristers in the cathedral church at Utrecht. At the age of nine he was removed to the school of Deventer, where his master was Alexander Hegius, and one of his school-fellows was Adrianus Florentius, who continued to be his friend when, long afterwards, he was elevated to the papal chair, under the name of Adrian the Sixth. At this early period he exhibited uncommon powers of memory; and it has been said, perhaps with some degree of exaggeration, that he could repeat all Terence and Horace. His affectionate mother, who had likewise fixed her residence at Deventer, died of the plague when he was about thirteen; and his father, deeply affected with her loss, speedily followed her to the grave. They had both of them attained the age of about forty.

Gerard had recommended his hopeful son to the care of

[1] Bayle, *Dictionnaire Historique et Critique,* tom. ii. p. 1091. Several biographers refer the birth of Erasmus to the year 1465; but the inscription of his statue at Rotterdam assigns the date of 1467.

Peter Winckel, master of the school of Gouda, and to that of other two guardians, but they all seem to have been alike unworthy of such a trust; for with the view of dividing his slender patrimony among themselves, they agreed to urge upon him the necessity of embracing the monastic state. They accordingly compelled him to betake himself to a convent of friars at Bois le Duc in Brabant, where, as he has himself stated, he lost three years of his existence. No artifice or persuasion could at first induce him to become a friar, nor did any length of time subdue his utter repugnance to a monastic life. Even at this early period, as has been well remarked, he could discern that religion was the thing least regarded in religious houses. He was afterwards placed in the convent of Sion near Delft; and having next been removed to that of Stein near Tergou, he reluctantly submitted to pass his year of probation, and to take the vows as a canon regular of St Augustin. His brother, who had likewise been devoted to the monastic profession, made an abrupt retreat from his convent, and led a profligate and dissolute life; but Erasmus, though he also quitted his monastic state, to which, as Du Pin observes, "he had no inward vocation," conducted himself with sobriety, and prosecuted his studies with great assiduity. In 1490 he left the monastery to reside in the household of Henry de Bergues, bishop of Cambray; and in 1492 he was ordained priest by the bishop of Utrecht. He had quitted the convent with the consent of the bishop, of the prior, and of the general of the order. He wore the habit as long as he conveniently could; but when he resided in Italy he was obliged to lay it aside, on account of its resemblance to the dress of those who attended persons infected with the plague. From Julius the Second he obtained permission to wear it or not, according to his own convenience, but on condition of still bearing some mark of his order; and from the same pope, or from his successor Leo the Tenth, he obtained an absolution from his monastic vows. For the name of Gerardi he had substituted that of Erasmus, as bearing a more classical form, with the same signification. This name is of a Greek origin, though its proper form is Erasmius; and, prefixing a Latin name of similar import, he adopted the appellation of Desiderius Erasmus, instead of Gerard Gerardi.

In the year 1496 he was prosecuting his studies in the university of Paris, where he became a member of the College of Montaigu, and was led to contract a friendship with our learned countryman Hector Boyce, afterwards principal of King's College, Aberdeen. The bishop of Cambray, who was more liberal of his promises than of his money, had undertaken to assist him with a small pension; but as he excited hopes which were never realized, Erasmus was left to the usual expedients of a scholar placed in such circumstances. He laboured very diligently to increase his own stock of learning, and endeavoured to earn his subsistence by taking private pupils: thus he gradually established a high reputation, and secured the friendship of individuals distinguished by their rank and influence, as well as by their talents and learning. One of his pupils was Lord Montjoy, in whom he found a steady friend, and who afterwards bestowed upon him an annual pension of a hundred crowns. It was apparently through his connexion with this young nobleman that he was induced to visit England. The plague drove him from Paris in the year 1497; and after passing through the Netherlands, where he was kindly treated by the marchioness of Vere in the castle of Tornenhens, he proceeded to London and Oxford. He now formed an acquaintance with John Colet, afterwards dean of St Paul's, and with Thomas Linacre, William Grocyn, and William Latimer, three individuals who each contributed to promote among their countrymen a more general taste for the elegancies of classical literature. He is said to have resided for some time in St Mary's College, Oxford; but not long afterwards we again find him at Paris, and he likewise appears to have visited Orleans. His *Enchiridion Militis Christiani* he had begun in 1494, at the castle of Tornenhens, but it was not completed till after an interval of several years. This little book became very popular, and was translated into various languages. An English version, ascribed to Tindall, was printed by Wynkyn de Worde in 1533.[1] About the same period he was preparing one of his most elaborate works, the *Adagia*, first printed at Paris in 1500, and was strenuously applying himself to the study of the Greek language. He mentions to one of his correspondents, that as soon as he could get any money, he would first purchase books, and afterwards clothes. He had already published several of his smaller tracts, and had laid the foundation of that celebrity which long continued to increase, and which that of very few modern scholars has exceeded. He had not however secured any adequate provision; and as he lived somewhat precariously, and wandered from one place to another, he was too frequently compelled to solicit the bounty of those to whom fortune had been more propitious.

It appears from his correspondence that he was occasionally residing in Paris in 1504 and the two succeeding years. To the study of the Greek language, to which he closely applied for the space of three years, he was induced to add that of the Hebrew; but, as Dr Jortin has remarked, "he soon grew tired of the attempt, in all probability for want of proper instructors and helps; else he did things infinitely harder than it is to learn Hebrew." The necessity of taking pupils interfered with his own plans of study, and prevented him from executing some literary projects which he had now formed. In 1506 he again made his appearance in England, and is then supposed to have visited Cambridge. During the same year, he returned to Paris, and took with him the sons of J. Baptista Boeria, first physician to Henry the Seventh. He next directed his course towards Italy; and while he was prosecuting his journey on horseback, he composed a poem on the infirmities of old age, and addressed it to William Cope, another physician. Although he had not completed his fortieth year, he considered himself as already numbered with the aged. His constitution had never been vigorous; and he was subject to various distempers, which his habits of unremitting application to study did not contribute to alleviate. At an earlier period of life, he had expressed some anxiety to visit Italy, in order to take a doctor's degree; which, as he was sufficiently aware, makes one neither better nor wiser; "but it must be done," says he, "if a man would be esteemed in the world." He accordingly took the degree of D. D. in the university of Turin. Having resided about fifteen months at Bologna, when he superintended the education of Boeria's two sons, he afterwards went to Venice, and there published a third edition of his Adages. He spent a winter at Padua, and repaired to Rome in the ensuing year. At Venice he contracted an acquaintance with Marcus Musurus and Scipio Carteromachus, who taught the Greek language at Padua and Bologna; and he availed himself of so favourable an opportunity of ob-

[1] This was soon followed by another edition, printed by John Byddell, and bearing the following title: "Enchiridion Militis Christiani, whiche may be called in Englysshe the hansom Weapon of a Christen Knyght; replenyshed with many goodly and godly preceptes: made by the famous clerke Erasmus of Roterdame, and newly corrected and imprinted." Lond. 1534, 8vo. Many English translations from Erasmus are mentioned in Mr Lowndes's Bibliographer's Manual of English Literature, vol. ii. p. 673.

taining a solution of some of the difficulties which had occurred to him in the explication of Greek proverbs. It was at this period that he became the tutor of Alexander Stewart, a natural son of James the Fourth, by Margaret the daughter of Archibald Boyd of Bonshaw. His pupil, who was a youth of an amiable disposition and of promising talents, had been sent to the continent under the direction of Sir Thomas Halkerton, and, having travelled through France, became a student in the university of Padua; but it was at Sienna that he studied grammar and rhetoric under Erasmus, who has left a very pleasing account of his character, and who affectionately bewailed his premature death. At a very early age, he became archbishop of St Andrews, and obtained *in commendam* the abbacy of Dunfermline and the priorship of Coldingham. To these ecclesiastical preferments he added the office of lord chancellor; but having accompanied his father in the unfortunate expedition to England, he was slain, along with other warlike churchmen, at the battle of Floddon-field, before he had completed the twentieth year of his age.[1]

Erasmus experienced a gracious reception from the pope and some of the cardinals, but Rome had not sufficient attractions for a person of his disposition. We again find him in England about the beginning of the year 1510. On his arrival, he took up his abode with Thomas More, who was then a young man, and who afterwards rose to great eminence. It was at this period that he composed one of his most popular works, *Stultitiæ Laudatio*, or the Praise of Folly, which has been translated into all or most of the cultivated languages of Europe. In this lucubration, which he dedicated to his friend More, he treated the pope and the court of Rome with but little ceremony; so that, as Dr Knight has observed, "he was never after this looked upon as a true son of the church." The king, before the death of his father, had addressed a very friendly letter to Erasmus when he was in Italy, and he now received him with courtesy, although it does not appear that he ever bestowed upon him any very substantial proofs of kindness. To the king, as well as to Cardinal Wolsey, he owns himself indebted, not for magnificent benefits, but for magnificent promises. His chief patron was William Warham, archbishop of Canterbury, and chancellor of the kingdom; who, besides many occasional gratuities, bestowed upon him a living worth about a hundred nobles, the rectory of Aldington, near Ashford in Kent.[2] This however he speedily resigned, reserving to himself a yearly pension of twenty pounds; to which the archbishop added an equal sum from his own purse. He was invited to Cambridge by Dr Fisher, bishop of Rochester, president of Queen's College, and chancellor of the university, who entertained him in his own house, and procured him the appointment of Lady Margaret's professor of divinity, and that of Greek professor. Of these offices however, the honour appears to have exceeded the emoluments, nor did he long continue his residence at Cambridge. In the Greek chair he was succeeded by Richard Croke, who had previously taught that language in the university of Leipzig. His treatment in England reflects no particular credit on the character of those who had the chief distribution of ecclesiastical preferments. The king, though capable of perceiving his merit, had not sufficient generosity to reward it; and the lordly churchmen reserved their best benefices for those who had other recommendations to their protection and favour. He has himself stated that if the promises made to him had been realized, he would have spent the remainder of his days in England; but having been invited to Brabant, to the court of Charles archduke of Austria, he again returned to the Netherlands, where he appears to have been residing in the beginning of the year 1514. With the honorary title of counsellor to that prince, he obtained an annual pension of two hundred florins, which, if it had been regularly paid, would have placed him in circumstances sufficiently easy. He was presented to a canonry at Courtray, but this he likewise resigned, reserving to himself a pension out of its yearly revenue.

He had for some time been laboriously employed in preparing an edition of the Greek Testament; and in the course of the same year he proceeded to Basel, for the purpose of printing it at the celebrated press of Froben. He likewise carried with him the epistles of St Jerom, illustrated with his notes, and some other books intended for publication. To the writings of this father he had devoted much attention, and, on his arrival, he was therefore gratified to find that an edition of his works had already been sent to the press. His edition of the New Testament was first printed in 1516; and other editions issued from the same press in 1519, 1522, and 1527. At Basel he now spent several months, much to his satisfaction, and was particularly gratified with the reception which he experienced from the bishop of that see. Returning to the Netherlands, he learned that Charles, who afterwards became emperor of Germany, had nominated him to a vacant bishopric in Sicily, supposing it to be at his own disposal; and, finding the right of nomination belonged to the pope, that he had solicited this preferment for Erasmus. But the recommendation, which perhaps was not very urgent, failed to produce any effect; nor did he hear of any effort to procure him a bishopric, where the patronage was more free from entanglement. In the year 1515, he appears to have paid another visit to Basel, and likewise to England. To this country he made another excursion in 1517. Of the domestic habits of the English, he has drawn a picture which now seems not a little antiquated. The plague, from which that country was scarcely ever free, and the sweating sickness, he partly ascribes to the incommodious form and bad exposition of the houses, to the filthiness of the streets, and to the sluttishness within doors. "The floors," says he, "are commonly of clay, strewed with rushes, under which lies unmolested an ancient collection of beer, grease, fragments, bones, spittle, excrements of dogs and cats, and every thing that is nasty."

Francis the First had invited him to fix his residence in France, and had promised him a benefice of a thousand livres; but of this offer he could not be induced to avail himself. He still lingered in the Netherlands; and we find him occasionally residing at Louvain, the seat of a university which was long conspicuous for the bigotry of its theologians, some of whom had appeared as his professed antagonists.[3] An event of great moment in the history of mankind was now impending. In the memorable year 1517, the reformation of religion in Germany began by Luther's bold and decided opposition to the scandalous traffic in indulgencies; one of the most corrupt practices of a most corrupt church. From this beginning, apparently trivial, arose many important events; and although Erasmus did not possess the undaunted spirit of a genuine reformer, his writings were not without considerable influence in preparing the way for those salutary changes which

[3] Beatus Rhenanus mentions his having taught at Louvain. "Docuit Lovanii, Cantabrigiæ in Anglia, Lutetiæ etiam privatim, ubi theologiæ dedit juvenis operam." Erasmus, in his short account of his own life, has stated that he went to Louvain after he first returned from England.

Erasmus. now began to take place. The edge of his wit and ridicule was very sharply directed against monastic ignorance and grimace, against the vain observances which were so generally substituted for real piety.[1] Many of his publications had a powerful tendency to promote a critical knowledge of the Scriptures and of ecclesiastical antiquity, and consequently were opposed, though indirectly, to the cause of popery. But he never had the courage to avow his adherence to the cause of reformation; and he himself admitted that he was not endowed with the spirit of a martyr.[2] He was sufficiently ready to condemn the heat and violence of the German reformer: but the task undertaken by Luther was not to be executed by a man of a cool and balancing disposition; and without a large portion of his unflinching impetuosity and undaunted resolution, his disputation and his preaching would, to all human appearance, have been utterly unavailing. No sudden and beneficial change in the affairs of mankind will ever be effected by those who, like Erasmus of Roterdam, keep themselves aloof from all danger, and recommend gentleness and moderation to others, when they have to contend against temporal power, fortified by inveterate prejudice, and roused by the most intense feelings of selfishness.[3] He was however very far from approving of the violent proceedings of Luther's adversaries. In the year 1520, he was consulted at Cologn by Frederick elector of Saxony, and gave a very favourable opinion of the reformer. Luther, he remarked, has been guilty of two offences; he has touched the crown of the pope and the bellies of the monks. He added, in a more serious strain, that he had justly censured many abuses and errors, which it was necessary to reform and correct; that his doctrine was essentially right, but that it had not been delivered with a proper temper, and with due moderation. Although his conduct did not fully satisfy the Lutherans, it still less satisfied the papists. The publication of his *Colloquia* did not contribute to recommend the author to the genuine sons of the Romish church: it exposed him to new accusations of laughing at indulgencies, of disregarding auricular confession, and of deriding the pious use of fish, instead of flesh, on certain appointed days. This book, the most popular of all his performances, was published at Basel: an impression, said to consist of twenty-four thousand copies, was printed in 1527 by Colinet at Paris, and dispersed with amazing rapidity. The sale was promoted by a rumour, which is supposed to have been circulated by the printer, that the work was on the point of being suppressed. During the preceding year, the theological faculty of Paris had censured it as a book in which the fasts and abstinences of the church are slighted, the suffrages of the holy virgin and the saints are derided, virginity is placed below matrimony, Christians are discouraged from a monastic life, and grammatical is preferred to theological erudition. In the year 1549 a provincial council, held at Cologn, condemned the Colloquies of Erasmus as unfit to be read in schools.

The latter years of his life he spent in Switzerland, chiefly at Basel and Friburg. In the summer of 1522 he paid a visit to Constance, professing an intention of repairing to Rome, for the purpose of waiting upon his old school-fellow the new pope; but to one of his correspondents he mentions that he had fallen sick at the former city, and was deterred by rumours of war from prosecuting his journey. It is however more than probable that he had no great inclination to proceed. Adrian offered him a good deanery, which he did not think it advisable to accept; for he apparently considered it in the light of a retaining fee from the pope. In Switzerland he had many friends, and was only prevented from liking the country by the suffocating heat of the stoves, and the bad quality of the wine. Being subject to the stone and gravel, he found the new and acid beverage unsuitable to his constitution, and was obliged to procure wine from Burgundy. As he kept two servants and two horses, it may be inferred that he was enabled to live in sufficient comfort.

Ulrich von Hutten, a distinguished adherent of Luther, passing through the city of Basel in 1522, solicited an interview, which the caution of Erasmus prevented him from granting.[4] A slight of this nature was more than sufficient to rouse the vehement indignation of the German knight, who speedily discharged his spleen in a publication entitled "Ulrici ab Hutten cum Erasmo Roterodamo, Presbytero, Theologo, Expostulatio." This satirical effusion was followed by the "Spongia Erasmi adversus Aspergines Hutteni." Hutten's insolence and ferocity were blamed by Melanchthon, and by Luther himself.

In the year 1523, Adrian was succeeded in the papal chair by Clement the Seventh, who sent Erasmus an honourable epistle, accompanied with a donation of two hundred florins. After many solicitations from different quarters, he was at length induced to write against Luther, but not on a subject which involved the chief points of debate between the protestants and papists. His tract *De Libero Arbitrio* was printed in the year 1524. "Luther," says Dr Jortin, "was an admirer of Augustin, and, like the Thomists, held a physical predetermination, which entirely subverts human liberty, and which, under the pretence of making the creature dependent upon the Creator, deprives it of all active powers, so that it can do nothing without being necessarily determined by the influence of God. If there was any difference between Luther and the Thomists of the church of Rome, it was this, that Luther spake more simply and sincerely and openly than they; for he absolutely denied that there was any such thing as free-will, whilst they admitted it in words. This perhaps deceived Erasmus, who imagined that he was only disputing against Luther, whilst he was really disputing as much against Thomas Aquinas and his followers, as against the reformer. Be that as it will, Erasmus makes many good remarks against the sentiment which he opposes, and justly insists upon it, that the human will co-operates with the grace or assistance of God."[5] In 1525 Luther returned an answer, in a treatise *De Servo Arbitrio*, where his antagonist is treated with much scorn and contempt. Erasmus immediately replied in the first part of his *Hyperas-*

[1] Dr Robertson has remarked that "there was hardly any opinion or practice of the Romish church which Luther endeavoured to eform, but what had been previously animadverted upon by Erasmus, and had afforded him subject either of censure or raillery." (Hist. of Charles V. vol. ii. p. 142.) See likewise Archdeacon Blackburne's Confessional, p. 409. The worthy archdeacon describes Erasmus as "one of the most illustrious characters in all history."

[2] J. A. Fabricius has written a tract on the religion of Erasmus, which may be found in his *Opusculorum historico-critico-literariorum Sylloge*, p. 357. Hamb. 1738, 4to.

[3] "As the man," says Dr Paley, "who attacks a flourishing establishment writes with a halter round his neck, few ever will be found to attempt alterations but men of more spirit than prudence, of more sincerity than caution, of warm, eager, and impetuous tempers; consequently, if we are to wait for improvement till the cool, the calm, the discreet part of mankind begin it, till church governors solicit, or ministers of state propose it—I will venture to pronounce that (without His interposition with whom nothing is mpossible) we may remain as we are till the renovation of all things." (Sermons and Tracts, p. 43.)

[4] See Schubart's Leben und Charakter Ulrichs von Hutten, S. 131. zweit. Ausg. Leipzig, 1817, 8vo.

[5] Jortin's Life of Erasmus, vol. i. p. 335.

pistes, and the second part appeared in the year 1527; but, upon the whole, he appears to have had no reason to congratulate himself on the issue of the controversy.

About this period, Erasmus prepared various other works. In 1525 he published "Lingua, opus novum, et hisce temporibus aptissimum." In 1528 he published, in one volume, two of the most conspicuous of his literary compositions. The first bears the title, "De recta Latini Græcique Sermonis Pronuntiatione Dialogus;" the second, "Dialogus cui titulus, Ciceronianus, sive de optimo Genere Dicendi." Both these works were printed at Basel. His dialogue on the pronunciation of the classical languages excited much attention, and occasioned much controversy.[1] The pronunciation of Greek which then prevailed, was in some countries denominated the Reuchlinian, from its having been adopted by Reuchlin, who died in the year 1521, after having been chiefly instrumental in the introduction of classical learning into Germany. It essentially coincided with the pronunciation of the modern Greeks. In the copious grammar of Scot,[2] first printed in the year 1593, we still find the same system recommended. To the letter β he assigns the name of vita, to ζ of zita, to η of ita, to θ of thita. According to this system, the vowels η, ι, υ, and the diphthongs ει, οι, have no variety of sound, but ought to be pronounced as the French pronounce the letter *i*. Thus τη, τι, τυ, τει, τοι, have one and the same sound, instead of five distinct sounds. This however is not the only peculiarity of the system. Reuchlin's mode of pronunciation was almost entirely supplanted by that of Erasmus, although several learned men have at a much more recent period endeavoured to restore the old method. In his other ingenious dialogue, the *Ciceronianus*, he ridicules some modern scholars, chiefly Italians, who studiously rejected every word or phrase which had not been sanctioned by the authority of Cicero. Of the dead and the living he speaks with his usual freedom; nor did this publication contribute to diminish the number of his enemies. It was attacked with great ferocity by Julius Cæsar Scaliger, who writes in a style by no means Ciceronian.

In the year 1529, after the mass had been abolished at Basel, he removed to Friburg, where he purchased a house, and repaired it at considerable expense. In 1533 he published at Antwerp a treatise bearing the title of "Liber de sarcienda Ecclesiæ Concordia." On the same subject, he has introduced many suggestions into his epistles; but the peace of the church was not to be patched up by any expedients which Erasmus was capable of devising. His "Ecclesiastes, sive de Ratione Concionandi," appeared in 1535; and while it was printing at Basel, he returned to that city, and there he completed his earthly pilgrimage. On the accession of Paul the Third, a design was entertained of elevating Erasmus to the rank of a cardinal; but he had never been ambitious of ecclesiastical dignities, and now the state of his health was such as to deprive all sublunary honours of their usual attractions. The pope nominated him provost of the college of canons at Deventer; but already considering himself as standing on the verge of the grave, he declined an office which he probably would not have accepted in the vigour of his life. He had left Friburg in a bad state of health, nor were his maladies alleviated by his removal to Basel. He became worse during the summer, and for about a month was afflicted with dysentery. Disregarding those formal and minute devotions which he had so much derided in the monks, he fervently implored the mercy of God through Jesus Christ; and retaining his reason unimpaired till his last moments, he calmly expired on the 12th of July 1536, when he had nearly completed the sixty-ninth year of his age. A great concourse of people attended his funeral in the cathedral church of Basel. By his will, dated in the month of February, he bequeathed handsome legacies to several of his friends, and directed the residue of his property to be distributed by his executors, in relieving the poor and the sick, in marrying young women, and in assisting young men, such as they should judge to be necessitous and deserving.

Erasmus, though somewhat low in stature, was well formed, and had an easy and genteel air, nor was he slovenly or negligent in his apparel. He had a fair complexion, with grey eyes, and, during his youth, his hair was of a pale yellow. He had a cheerful countenance, with a low voice, and a pleasing elocution. He was a steady friend, and an agreeable companion; and indeed if his conversation displayed any portion of the wit and vivacity which distinguish his writings, his society could not fail of being delightful. Ardently devoted to letters, he kept his mind uncontaminated with that avarice and ambition by which churchmen have in too many instances been secularized. In disseminating a love of elegant letters among his contemporaries, he had no small influence, and equally conspicuous were his merits as a theologian. For the lifeless formalities of scholastic theology he had little respect, and less relish; but by his labours on the New Testament, and more especially by his publication and elucidations of the original text, he gave a new impulse to the students of that age, and directed their minds to a more edifying species of knowledge. To him belongs the honour of being the earliest editor of the Greek Testament; for although the Alcala edition, inserted in the Polyglot Bible, bears the imprint of 1514, it was not published till the year 1522. Of his paraphrase of the New Testament, an English translation was printed at an early period;[3] and so high was the estimation in which it was held, that a copy of it was directed to be placed in every parish-church in the kingdom.[4] The works of the ancient fathers of the church he had studied with much assiduity. To editions of Irenæus, Chrysostom, Cyprian, Hilary, Ambrose, Jerom, Augustin, and Arnobius the younger, he contributed more or less aid; and he translated particular treatises of Origen, Athanasius, Basil, and Chrysostom. His labours likewise served to render the writings of the ancient classics more accessible. Of the Geography of Ptolemy, the Greek text was first edited by Erasmus. He published editions of Livy, Seneca, Suetonius, and other authors; and if he seldom added notes, his prefaces were considered as no small recommendation. He translated into verse the Hecuba and Iphigenia of Euripides, and into prose detached works of Galen, Plutarch, Lucian, and Libanius. The labours of Erasmus were multifarious, and his compositions are very numerous; for our scanty limits have only afforded us an opportunity of specifying the more remarkable. An ample and elegant edition of his works

[1] Of this famous controversy a detailed account may be found in the Foreign Quarterly Review, vol. xiii. p. 60.

[2] Alexander Scot, LL. D. was a native of Scotland, but he appears to have spent the greatest part of his life in France, and to have exercised the functions of a judge at Carpentras. "Alexander Scotus Aberdonensis, magni nominis, sed majoris meriti, utriusque linguæ peritus, juris civilis scientia in paucis clarus, Carpentoractensis præfectus juri dicundo, quo in munere non minorem integritatis quam eruditionis famam acquisivit." (Dempsteri Historia Ecclesiastica Gentis Scotorum, p. 664.) We use the third edition of his *Universa Grammatica Græca*. Lugduni, 1614, 8vo. This is not the only work which Scot published.

[3] Lond. 1548–9, 2 vols. fol. The translation was executed by Miles Coverdale, Nicholas Udall, John Olde, and others. See Dr Dibdin's Typographical Antiquities, vol. iii. p. 491.

[4] Burnet's History of the Reformation, vol. ii. p. 27.

was published by Le Clerc, to whom we are likewise indebted for a discriminating account of the author's life and character.[1]

Dr Jortin has remarked that "the style of Erasmus is that of a man who had a strong memory, a natural eloquence, a lively fancy, and a ready invention, who composed with great facility and rapidity, and who did not care for the trouble of revising and correcting; who had spent all his days in reading, writing, and talking Latin; for he seems to have had no turn for modern languages, and perhaps he had almost forgotten his mother tongue. His style therefore is always unaffected, easy, copious, fluent, and clear, but not always perfectly pure and strictly classical. He hath been censured, as a dealer in barbarisms, by persons who not only had not half of his abilities and erudition, but who did not even write Latin half so well as he. His verses are plainly the compositions of one who had much learning and good sense, and who understood prosody, or the technical part of poetry, but who had not an equal elegance of taste, and an ear for poetical numbers. So that upon the whole he is rather a versifier than a poet, and is not to be ranked amongst the Italian poets of those days, Sannazarius, Fracastorius, Vida, &c., many of whom wrote better than any of the ancients, except Lucretius, Virgil, Horace, and a few more." (D. I.)

ERATO (from ἐράω, *I love*), in *Mythology*, the name of the muse who presided over amatory poetry. The invention of the lyre and the lute has by some been ascribed to this muse. She is represented with a garland of myrtles and roses, holding a lyre in one hand and a bow in the other, while at her side is seen a Cupid with his torch. One of the Nereids also bore the same name.

ERATOSTHENES, a celebrated astronomer and geometrician of Alexandria, was born at Cyrene B.C. 276. His father's name was Aglaus or Ambrosius. He was appointed superintendent of the great Alexandrian library by Ptolemy Euergetes, and died of voluntary starvation B.C. 196. His works, with the exception of the *Catasterismi*, or catalogue of the constellations, exist only in fragments. For a complete list of them see the *Eratosthenica* of Bernhardy. An account of his astronomical and geometrical discoveries is given under ASTRONOMY, *History of.*

ERATOSTRATUS, or more properly EROSTRATUS, an Ephesian who fired the famous temple of Diana the same night on which Alexander was born (B.C. 356), the watchful care of the goddess being withdrawn to attend the labour of Olympias. Having confessed that the desire to immortalize his name instigated him to the deed, Eratostratus was condemned by the Ephesians to eternal oblivion.

ERASTUS, or LIEBER, THOMAS, a German physician, who was the formal originator of the opinions now generally denominated *Erastian*. He was born at Baden in Switzerland in 1523; studied at Basle; and was professor of medicine at Heidelberg. He was afterwards professor of ethics at Basle, where he died in 1584. Erastus was the author of several medical works, but that for which he is chiefly known is the work on *Excommunication*, in which he promulgated his peculiar opinions; which are known under the name of Erastianism. He taught that the church had no right to refuse participation in the Lord's Supper, baptism, or other ordinances of the gospel, to any one, that it had no right to inflict excommunication or any kind of censure, and that the punishment of all offences, religious as well as civil, should be left in the hands of the civil magistrate.

ERBACH, a town of Hesse-Darmstadt, province of Starkenburg, on the Mümling, 24 miles S.E. of Darmstadt. Pop. 2100. It is the capital of a county formerly independent, but mediatized in 1806. The palace contains interesting collections of armour and antiquities. There are several other towns of this name in Germany.

ERBIL, a town of Persia. See ARBELA.

EREBUS, Ἔρεβος (from עֶרֶב, *night*), in *Mythology*, a term denoting darkness. According to Hesiod, Erebus was the son of Chaos and Night, and the father of the day. This was also the name of part of the infernal regions among the ancients; and a peculiar expiation was provided for those who were detained in Erebus.

Erebus was properly the gloomy region, and distinguished both from Tartarus the place of torment, and Elysium the region of bliss. According to the account given of it by Virgil, it forms the third grand division of the invisible world beyond the Styx, and comprehends several particular districts, as the *limbus infantum*, or the receptacle for infants; the *limbus* for those who had destroyed themselves; the fields of mourning, full of dark groves and woods, inhabited by those who died of love; and beyond these, an open champaign country for the accommodation of departed warriors.

ERECHTHEUS, or ERICHTHONIUS, an Athenian hero. See ATTICA, vol. iv., p. 192.

EREKLI, or EREGLI, the modern name of Heraclea, which see.

EREMITE. See HERMIT.

ERETHISM (ἐρεθισμός), in *Medicine*, a morbid degree of energy in the performance of any function.

ERETRIA, one of the most ancient and powerful cities of Eubœa, was situated on the western shore of the island in a south-easterly direction from Chalcis, from which it was not very far distant. Its inhabitants were a mixed race of Attic and Triphylian colonists; but the preponderating element in the city was Ionic. At an early period Eretria became famous as a maritime power; and the excellence of its position afforded it great facilities for the development of its resources in this direction. The great plain of Lelantum, at the southern extremity of which Eretria lay and at the northern Chalcis, was one of the most fertile spots in Greece. It was claimed by Eretria and Chalcis alike, and the contests for its possession gave rise to long and bloody feuds between the rival cities. In one of these the Eretrians were assisted by the Milesians, and in gratitude for this good office sent reinforcements to aid that people in their revolt from the Persians, B.C. 500. Ten years after this event, Eretria was besieged by Datis and Artaphernes, the generals of Darius. After a siege of six days it was taken and razed to the ground, and the inhabitants were carried off into slavery. A new town was soon after built a little south of the ancient site, and became a place of some importance. On the decay of the Athenian power, towards the end of the Peloponnesian war, the Eretrians joined the other Eubœans in throwing off the yoke of Athens. After this date Eretria experienced a variety of vicissitudes. It was at first governed by tyrants; and though a popular form of government was once more established with the aid of the Athenians, it finally became subject to Macedonia. On the overthrow of that kingdom by the Romans at Cynoscephalæ, Eretria was again declared to be free. Of the subsequent history of the city and its final decay, nothing is known. No remains of Old Eretria now exist, but considerable ruins of the new city may still be traced near the modern Vathy.

[1] Desiderii Erasmi Opera omnia emendatiora et auctiora. Lugd. Bat. 1703–6, 10 tom. fol. Le Clerc's account of Erasmus, chiefly derived from his letters, may be found in the *Bibliothèque Choisie*, tom. v., p. 145, tom. vi., p. 7. His other biographers are numerous; and we shall mention the most considerable Lives which have appeared in a separate form. Knight's Life of Erasmus, more particularly that part of it which he spent in England. Cambridge, 1726, 8vo. Burigny, Vie d'Erasme. Paris, 1757, 2 tom. 12mo. Jortin's Life of Erasmus. London, 1758–60, 2 vols. 4to. Hess's Erasmus von Roterdam nach seinem Leben und Schriften. Zürich, 1790, 2 Bde. 8vo. Of M. de Burigny's work, a German translation, with corrections and additions, was published by Professor Henke. Halle und Helmstädt, 1782, 2 Bde. 8vo. Dr Knight's work had been translated into the same language by Theodor Arnold. Leipzig, 1735, 8vo.

For an account of the Eretrian school of philosophy, founded by Menedemus, a native of the place and a disciple of Plato, see MENEDEMUS.

ERFURT, a city of Prussian Saxony, capital of a cognominal government, on the Gera, 14 miles E. of Gotha, and about the same distance W. of Weimar. It was formerly the capital of Thuringia, and is a fortress of the second class, being of importance on account of its position on the high road between Frankfort and Leipzig. It has two citadels, the one Petersburg, within the walls, the other Cyriaksburg, on Mount Cyriaks, outside the town. Erfurt is an old, dull, and irregularly built town, having no street or square worthy of notice, except the market place which is ornamented with a stone obelisk 50 feet high, erected in 1802 to Charles, Elector of Mayence. The cathedral is a fine Gothic building standing on an eminence, and having a famous bell (called the Susanna) 10 feet high, 30 feet in circumference, and weighing 275 cwt. The largest and finest church after the cathedral is the Predigerkirche. The church of St Severus is distinguished by its three towers. The Barfüsserkirche, of which a part fell in 1838 but has since been restored, is also worthy of notice. In the beginning of the present century Erfurt had eight convents, but of these only one now remains, the Ursuline nunnery, in connection with which is a female school. The Augustine monastery, which Luther entered as a monk on 17th July 1505, is now used as an orphan asylum. The cell which he inhabited is still preserved in its original condition, and contains his portrait, bible, and other relics. The university established here towards the end of the fourteenth century was suppressed in 1816. There are, however, a botanic garden, observatory, anatomic theatre, and a public library of about 50,000 volumes. Among the other educational institutions, which are numerous, may be mentioned a Roman Catholic and a Protestant gymnasium, a normal school, midwifery school, deaf-mute and blind institutions, a royal academy of popular sciences, trade and commercial schools. In the time of Charlemagne this was one of the chief commercial cities of Germany, and it afterwards became a member of the Hanseatic League. In the end of the sixteenth century it is said to have had as many as 58,000 inhabitants. It was first annexed to the Prussian dominions in 1803, and from 1807 to 1813 was in the possession of the French. In 1808 the memorable interview between Napoleon and the Emperor Alexander of Russia took place here. It was restored to Prussia in 1814. In 1849 Erfurt contained 32,224 inhabitants, including 5561 military: of these 25,438 were Protestants, 6619 Roman Catholics, and 167 Jews. They are chiefly employed in the manufacture of linen, woollen, and cotton goods, and silk ribands; and in shoemaking, and the rearing of garden produce. The government comprehends nine circles, and has an area of 1306 square miles. Pop. (1849) 347,279, of whom 247,332 were Protestants, 98,485 Roman Catholics, and 1457 Jews. Pop. (1852) 350,781.

ERGASTULUM, among the ancient Romans, a kind of work-house or private prison, usually attached to farms, where the slaves were made to work in fetters. It was usually under ground; and from this dungeon the unhappy inmates were led forth in chains to cultivate the fields. Confinement in the Ergastulum was also used as a punishment for disobedient or intractable slaves, who frequently experienced in these dungeons great severities. At length, after various enactments for ameliorating the condition of slaves, the ergastula were entirely abolished by Hadrian.—(See Spart., *Hadrian*, 18; Plutarch, *Tib. Gracch.* 8.)

ERGOT (Fr. *ergot, a cock's spur*), a disease caused in rye and some other grasses by the attack of a fungus called *Ergotætia abortans*, which induces a morbid condition in the ovarian cells. See BOTANY, vol. v., p. 172. Rye thus affected is highly poisonous, and has sometimes caused death by a kind of mortification called dry gangrene. Ergot is a valuable agent employed in obstetric practice for promoting the contraction of the uterus.

ERICACEÆ, the heath order of plants. See BOTANY, Nat. Ord. 131.

ERICIUS, in *Roman Antiquity*, a military engine, so named from its resemblance to a hedge-hog. It was a kind of chevaux-de-frise, and was placed as a defence at the gate of the camp.

ERIDANUS, a river celebrated in ancient mythology as that into which Phaethon is said to have fallen when struck by the lightning of Jupiter, and on whose banks his sisters bewailed his loss so bitterly that they were changed into long and slender poplars, and their tears into amber. By the later writers this river has been identified with the *Padus* or Po, but the absence of amber there, and other circumstances, have led to the belief that the Eridanus of the earlier writers is to be sought for among the more northern rivers of Europe. Cluverius has suggested that the Eridanus of Herodotus may be the *Rhodaune*, a tributary of the Vistula; whilst others, knowing that amber was the staple production of the Baltic, are inclined to believe it to be the name applied to that sea by mythologists, who were little acquainted with geography.

ERIDANUS, in *Astronomy*, a constellation of the southern hemisphere, containing 84 stars.

ERIE, a lake of North America. See CANADA.

ERIGENA, JOANNES SCOTUS, a famous scholastic divine, was born about the beginning of the ninth century; but the place of his birth is a matter of considerable uncertainty. Bale and Pitts affirm that he was born at St David's in Wales; Dempster, Mackenzie, and Henry, that he was a native of Scotland. Dempster contends that he was born at Ayr, and in order to suit the name to the hypothesis, he describes him as Joannes Airigena. Du Pin, Sir James Ware, and Dr Ledwich have with greater probability asserted that he was by birth an Irishman, Ireland being then called *Scotia*, and by the natives *Erin.* Various writers agree in relating that he travelled to Athens, where he acquired a competent knowledge of the Greek and oriental languages; and that he afterwards resided many years at the court of Charles the Bald, king of France, who, on account of his singular abilities, treated him as his intimate friend and companion. He slept frequently in the royal apartment, and was constantly admitted to the king's table. "We may judge," says a modern historian, "of the freedom which he used with Charles, by the following repartee. As the king and Scotus were sitting one day at table, opposite to each other, after dinner, drinking a cheerful glass, the philosopher having said something that was not quite agreeable to the rules of French politeness, the king in a merry humour asked him, Pray, what is between a *Scot* and a *sot?*" To which he answered, "Nothing but the table."[1] During his residence with Charles, he wrote several books of scholastic divinity, but was not so fortunate as to escape the imputation of heterodoxy. On that account the pope commanded Charles to send him to Rome; but the king had too great a regard for his companion to trust him with his holiness. One of the chief controversies in which Erigena was engaged, and with which the pope was much offended, was concerning the real presence. His opinion of this weighty matter is expressed in these few words:—"What we receive corporally is not the body of our Lord, but that which feeds the soul, and is only perceived by faith."

Whether Erigena ended his days in France is a matter of doubt. Some historians relate that he quitted it in 864; and that, after residing about three years in Oxford, he re-

[1] Henry's *History of Great Britain*, vol. i., p. 344.

tired to the abbey of Malmesbury, where his scholars stabbed him with their pen-knives. There is no foundation for this story. Probably he died about 874; but whether in France or England, is uncertain, and of little importance. Some have related that he was invited to England by King Alfred; but they have apparently confounded him with John abbot of Etheling, who was assassinated in 895; and to this mistake the various accounts concerning Erigena are to be attributed. Amongst other works, he composed the following:—1. *Excerpta de Differentiis et Societatibus Græci Latinique Verbi.* 2. *De Divisione Naturæ lib. v.* 3. *De Prædestinatione Dei.* 4. *De Visione Dei.* 5. *De Corpore et Sanguine Domini.* 6. *Ambigua S. Maximi, seu Scholia ejus in difficiles locos S. Gregorii Nazianzeni, Latine versa.* 7. *Opera S. Dionysii quatuor in Latinam linguam conversa.* Most of these works have been printed. There is an edition of his books *De Divisione Naturæ.* Oxon. 1681, fol. The author was formerly denominated the Glory of the Greeks; an appellation to which, in the opinion of Montfaucon, he was not sufficiently entitled.[1] For the age in which he lived, he however appears to have been a person of eminent learning; and his translation of Dionysius Areopagita has received no mean commendation from Huet.[2]

ERIGONE, in *Grecian Mythology*, daughter of Icarus. Dying of grief on account of her father's death, she was translated to heaven, and formed the sign Virgo. See EORA.

ERINITE, a native arseniate of copper, of a fine emerald-green colour. It was found at Limerick in Ireland—whence the name.

ERINNA, a Greek poetess, the friend and contemporary of Sappho, from her intimacy with whom, although born in Rhodes, she is frequently called a Lesbian. Of her poems, which attained the highest celebrity in ancient times, only a few lines are now extant. Another poetess of this name is said to have flourished in the age of Demosthenes, but her existence is matter of considerable uncertainty.

ERINNYES, another name for the Eumenides, or Furies. See FURIES.

ERIOMETER (ἔριον, *wool*, and μέτρον, *a measure*), an instrument invented by Dr Young, for measuring the fineness of the fibres of wool, by ascertaining the diameter of any one of the series of coloured rings they produce. See CHROMATICS, vol. vi., p. 651.

ERIPHYLE, the daughter of Talaus and Lysimache, and wife of Amphiaraus. By the gift of a necklace she was bribed by Polynices to reveal the hiding-place of her husband, who was unwilling to accompany the Argives against Thebes. Her faithlessness was avenged by Alcmæon her son, who put her to death as soon as he had learned that his father had perished in the expedition.

ERIS, the goddess of discord among the Greeks. She is the same as the *Discordia* of the Latins.

ERIVAN or IRWAN, a fortified town of Russian Armenia, and capital of a cognominal province, is situated on the Zengui, an affluent of the Araxes, 110 miles S.S.W. of Teflis. The town is of considerable extent, but it is interspersed with numerous gardens, and a great part of it is in ruins. Pop. only about 12,000. It is defended by a citadel standing on a steep rock 600 feet in height, overhanging the river. This fortress is about 2000 yards in circumference, and contains the ancient palace of the Khans, now the residence of the governor, a fine mosque, a cannon foundry, and barracks. The town is ill built, but contains a large bazaar, a Greek and several Armenian churches, an Armenian convent, and several mosques. There is a handsome stone bridge across the river. Erivan has a considerable trade, and is a station for caravans from Teflis to Erzeroum. It has also some manufactures of cotton stuffs, leather, and earthenware, and is noted for the excellence of its fruits and melons. Erivan was taken by the Russians in 1827, and confirmed to them by treaty with Persia the following year.

ERLANGEN, a town of Bavaria, circle of Middle Franconia, near the Regnitz, eleven miles N. of Nürnberg, and on the railway between that town and Bamberg. It is surrounded by walls, and divided into an old and new town, the latter consisting of wide, straight, and well-built streets. Erlangen is noted for its university, the only Protestant one in Bavaria. This institution was founded by Frederick margrave of Bayreuth in 1743. The average attendance of students is about 350. It occupies the ancient palace of the margraves of Bayreuth, and has faculties of arts, medicine, and theology, museums of natural history, a botanic garden, and a library of upwards of 100,000 volumes. The town owes its prosperity chiefly to the French Protestant refugees, who settled here on the revocation of the edict of Nantes, and introduced various manufactures. Erlangen has manufactures of woollen and cotton goods, hosiery, hats, leather, gloves, and plate-glass. Pop. (1852) 10,910.

ERLAU (Hung. *Eger*, Slav. *Jager*, Lat. *Agria*), a fortified town of Hungary, capital of the county of Heves, situated in a beautiful and fertile valley on both sides of the Erlau, an affluent of the Theiss, 67 miles N.E. of Pesth. Pop. about 20,000, most of whom are Catholics. Previous to 1802 it was the seat of a bishop, but since that period it has been the seat of an archbishop. It is inclosed by old walls, and entered by six gates. On an eminence above the town stands the old castle, which was frequently besieged during the Turkish wars, both by Moslem and Christian. The principal edifices in the town are the cathedral, built in the form of a Latin cross and surmounted by a cupola, the Archbishop's palace, the lyceum, with a library and observatory, the county hall, and the new barracks. Besides the cathedral it has four Roman Catholic churches, a Greek and a Protestant church, and two monasteries. There are also a Roman Catholic high school and ecclesiastical seminary, gymnasium, hospital, and several libraries. The vicinity is highly cultivated, and produces fine red wines and tobacco. The manufactures are linens, woollens, hats, leather, &c.

ERMIN, an order of knights instituted in 1450, by Francis I., Duke of Bretagne, and which formerly subsisted in France. The collar of this order was of gold, composed of ears of corn in saltier, at the end of which hung the ermine, with the inscription *à ma vie.* But the order expired when the dukedom of Bretagne was annexed to the crown of France.

ERMINE, an animal of the genus *Mustela*, an inhabitant of northern climates in Europe and America. It nearly resembles the marten in shape, but the weasel in its habits. During summer the upper part of the body is of a pale tawny brown colour, and the tail tipped with black; but in winter the fur assumes that snowy whiteness for which it is so much admired.

ERMINE, and ERMINES, and ERMINOIS, in *Heraldry*. See HERALDRY, § *Of Furs.*

ERNE, LOUGH. See FERMANAGH.

ERNESTI, JOHN AUGUSTUS, one of the most illustrious philologers and theologians of the last century. He was born Aug. 4, 1707, at Tennstadt, of which place his father, likewise a distinguished theologian, was pastor, and superintendent of the electoral dioceses of Thuringia, Salz, and Sangerhusen. After having received his first instruction in the learned languages under the domestic discipline of his father, and in the gymnasium of his native town, he was sent at the age of sixteen to the celebrated Saxon

[2] Huetius, *de Interpretatione*, p. 154.

cloister school of Pforta. Here he continued four years. At the age of twenty he entered the university of Wittemberg, where he studied eloquence and ancient literature under the celebrated Berger, theology under Wernsdorf, and the Wolfian philosophy under Schlosser. From Wittemberg he passed to the university of Leipzig, where he applied himself to the mathematical sciences under Hausen, following the courses of Boerner and Deyling on theology, and the lectures of Gottsched on German eloquence. In 1730 he was made master in the faculty of philosophy. In the following year he accepted the office of corrector in the Thoman school of Leipzig, of which J. M. Gesner was then rector; and on Gesner's vocation, as professor of eloquence, to Göttingen, he succeeded him as rector. He was, in 1742, named extraordinary professor of ancient literature in the university of Leipzig, and in 1756 promoted to the ordinary professorship of eloquence. Here his reputation as a scholar, and his rational treatment of the biblical exegesis, paved the way for his entrance into the theological faculty. Through the elegance of his learning, and his manner of discussion, he co-operated with Baumgarten of Halle in disengaging dogmatic theology from the scholastic and mystical excrescences with which it was then deformed, and thus paved the way for a revolution in theology. In these deserving labours, and with unbroken health, he attained an honourable old age; and died, after a short illness, in his seventy-sixth year, Sept. 11, 1781.

As a philologer or theologian, it is perhaps as much from the impulse which Ernesti gave to sacred and profane criticism in Germany, as from the intrinsic excellence of his own works in either department, that he must derive his reputation. With Gesner, he instituted a new school in ancient literature; and after Crocus, Melanchthon, and Camerarius, has been perhaps the greatest reformer and promoter of classical learning in Germany. With Semler he partially co-operated in the revolution of Lutheran theology; though he is guiltless of all participation in the deductions which many of those who profess themselves his disciples have drawn from the principles which he established.

From the Reformation down to the latter half of the eighteenth century, Germany was far excelled by Holland in the number and excellence of her philologers; and it was not until the appearance of Gesner and Ernesti, with their somewhat earlier contemporaries, Cortius, Daniel Longolius, and Michael Heusinger, that she could oppose above one or two rivals to the great critics of the Dutch schools. Gesner and Ernesti, however, through the influence of their lectures at the greater universities of Göttingen and Leipzig, through the wider extent of their labours in philology, and still more through the greater excellence of their methods, are entitled to be held the founders of the new German school of ancient literature. Both, but especially Ernesti, have detected grammatical niceties in the Latin tongue which had escaped all preceding critics; such, among others, are the use of the subjunctive mood after the pronoun *qui*, and the legitimate consecution of the tenses. His canons are, however, not without exceptions. As an editor of the Greek classics, Ernesti deserves hardly to be named beside his Dutch contemporaries, Hemsterhuis, Valkenaer, Ruhnken, or his colleague and enemy the learned and unfortunate Reiske. How insignificant are his own labours in his editions of Homer and Callimachus! In regard to the higher criticism, it was not even attempted by Ernesti. But to him and to Gesner the peculiar praise is owing of having formed, partly by their discipline, and partly by their example, philologers greater than themselves; and to them is due the honour of having kindled the national enthusiasm for ancient learning.

As a theologian, Ernesti is far less conspicuous than as a scholar, and his influence not so marked either on his contemporaries or on his successors. He began his career when the Speneriau pietism had been almost banished from the Lutheran theology; when to the study of theology, philosophy had been imperfectly applied, and without any interesting result, by Baumgarten, a scholar of Wolf; and historical interpretation had, in the hands of Semler, been productive of conclusions subversive of much that had been hitherto held orthodox and even sacred. In the grammatical interpretation of the New Testament some imperfect progress had been made by Bengel; but the new epoch in the biblical exegesis commences with John David Michaelis for the Old, and with Ernesti for the New Testament. It is, indeed, chiefly in *hermeneutics* that Ernesti has any claim to the character of a great theologian. But here his merits are distinguished, and, at the period when his *Institutio Interpretis N. T.* was published, almost peculiar to himself. In it we find the principles of a general interpretation, formed without the assistance of any particular philosophy, not even of the Wolfian, to which Ernesti was attached; but consisting of observations and rules, which, though already enunciated, and applied in the criticism of the profane writers, had never rigorously been employed in the biblical exegesis. He admits in the sacred writings as in the classics only *one acceptation*, and that the *grammatical*, convertible into and the same with the *logical* and *historical*. He therefore justly censures the opinion of those who, in the illustration of the Scriptures, refer everything to the illumination of the Holy Spirit; as well as that of others who, disregarding all knowledge of the languages, would explain words by things, and thus introduce into the holy writings their peculiar glosses and opinions. The *analogy of faith*, as a rule of interpretation, he greatly limits, and teaches that it can never alone afford the explanation of words, but only determine the choice among their possible significations, and must always stand in need of philology as an assistant. The spirit of Ernesti's interpretation gives no countenance, however, to the results which many of his followers have deduced from the grammatical and historical exegeses. Every principle of his interpretation rests on the assumed inspiration of the holy books; and there is not perhaps a better antidote to the poisonous tenets of many of those who profess to be of his school, than the diligent study of his *Interpres*, and the relative *Acroases* of Morus. In the higher criticism of the sacred books Ernesti did nothing. In dogmatic he always expressed great contempt of strict systematic theology; and though he lectured for many years on the Aphorisms of Neumann, it was rather in refutation than in support of his text-book.

Among his works the following are the more important:—I. In classical literature: *Initia Doctrinæ Solidioris*, 1736, 8vo, many subsequent editions; *Initia Rhetorica*, 1730; *Xenophontis Memorabilia Socratis, cum notis*, 1737, often reprinted; *Ciceronis Opera cum clave*, 3d ed., 1776; *Suetonius cum Animadversionibus*, 2d ed., 1775–8; *Taciti Opera cum notis J. Lipsii, Jo. Fr. Gronovii et suis*, 2d ed., 1772; *Aristophanis Nubes cum Scholiis Antiquis et præfatione*, 1754, 8vo; *Corradi Quæstura cum præfatione*, 1754, 8vo; *Hederici Lexicon Græcum, multis Vocabulorum millibus Auctum*, 1754–67, 8vo; *Homeri Opera Omnia, ex Recensione, et cum Notis Sam. Clarkii, accessit Varietas Lectionum MS. Lips. et Edit. Vet. cura J. A. E. qui et suas Notas adspersit*, 1759–64, 5 vols. 8vo; *Callimachi Hymni et Epigrammata, cum Notis Var. Latine vertit atque Notis adjecit*, Lugd. Bat. 1761, 8vo, 2 vols.; *Polybius cum Notis Var. Præfationem et Glossarium Polybianum adjecit*, Viennæ et Lips. 1764, 3 vols. 8vo; *Archæologia Litteraria*, 1768, a new and improved edition by Martini; *Horatius Tursellinus de Particulis*, 1769, 8vo; *Fabricii Bibliotheca Latina nunc melius delecta, rectius digesta et aucta*, vols. i. and ii. 1773, vol. iii. 1774, 8vo, unfinished. II. In sacred literature: *Antimuratorius sive Confutatio Disputationis Muratorianæ de rebus Liturgicis*, 1755–58; *Neue Theologische Bibliothek*, vols. i. to x. 1760–69, 8vo; *Institutio Interpretis Nov. Test.*, 3d ed., 1775, 8vo; *Neueste Theologische Bibliothek*, vols. i. to x. 1771–75, 8vo. Besides these, he published above a hundred smaller works in the form of prefaces, academical dissertations, programmata, memoriæ, elogia, epistles, orations, translations, &c. Many of these have been collected in the three following publications:—*Opuscula Oratoria*, Lugd. Bat. 1762,

2d edit. 1767, 8vo; *Opuscula Philologica et Critica*, Lugd. Bat. 1764, 2d edit. 1776, 8vo; *Opuscula Theologica*, Lips. 1773, 8vo.

Ernesti, *Augustus Wilhelm* (1733–1801), the nephew of the preceding, was professor of philosophy at Leipzig, and afterwards succeeded his uncle in the chair of eloquence in that city. He is principally known from his edition of Livy. He was in turn succeeded by his cousin Johann Christian Theophilus (1756–1802), who published amongst other works a *Lexicon Technologiæ Græcæ Rhetoricæ; Lex. Tech. Romanorum Rhetoricæ*, a translation of Dumesnil's *Latin Synonyms*, and of several of Cicero's works.

EROS, the Cupid of the Greeks. See Cupid.

EROSION (*e* and *rodo, I gnaw*), the act or operation of eating away; corrosion; canker.

EROTIA, or Erotidia, a festival in honour of Eros, the god of love, celebrated by the Thespians every fifth year, with games and contentions in music and poetry. See Cupid.

EROTIC (ἐρωτικός, from ἔρως, *love*), pertaining to, or treating of love.

EROUAD, or Erroad, a town of Hindustan, in the province of Coimbetoor. It contained during the reign of Hyder about 3000 houses, but was reduced to one-third in the reign of Tippoo; and during the invasion of General Meadows the town was destroyed. It is now fast recovering, and contains a considerable population. It was taken by the British in 1768, and retaken the same year by Hyder. It was again taken by the British in 1790, and retaken by Tippoo; but it came into the final possession of the British, along with the province, in 1799. A canal of irrigation cut in its vicinity has been productive of much benefit to the inhabitants. E. Long. 77. 46., N. Lat. 11. 19. (E. T.)

ERPENIUS or d'Erpe, Thomas, a celebrated orientalist, born at Gorcum in Holland, on the 7th September 1584. Observing his aptitude for learning, his father sent him to Leyden at the early age of ten; and it was in that city that he commenced his studies. At the end of several months, however, he went to Middelburg, but he soon after returned to Leyden. He was early admitted into the university of that city, and in 1608 took the degree of master of arts. By the advice of Scaliger he learned the oriental languages whilst taking his course of theology, and even then gave promise of great distinction in that department of learning. He afterwards travelled in England, France, Italy, and Germany, forming connections with learned men, and availing himself of the information which they communicated. During his stay at Paris, he contracted a friendship with Casaubon, which lasted during his life; and also took lessons in Arabic from Joseph Barbatus, otherwise called Abu-dakni. At Venice he perfected himself in the Turkish, Persic, and Ethiopic languages. After a long absence, Erpenius returned to his own country in 1612, rich in the learning which he had acquired during his travels, as well as beloved by all the learned whom he had visited. His acquirements being already known and appreciated, he was, on the 10th February 1613, appointed professor of Arabic and other oriental languages, Hebrew excepted, in the university of Leyden. From this period he devoted himself solely to the teaching of these languages; and animated by the example of Savary de Brèves, who had established an Arabic press at Paris at his own charge, he caused new Arabic characters to be cut at a great expense, and erected a press in his own house. In 1619 the curators of the university of Leyden instituted a second chair of Hebrew in his favour. In 1620 he was sent by the States of Holland to induce Pierre Dumoulin or André Rivet to settle in that country; and after a second journey he was successful in inducing Rivet to comply with their request. Some time after the return of Erpenius, the States appointed him their interpreter; and in this capacity he had the duty imposed upon him of translating and replying to the different letters of the Moslem princes of Asia and Africa. The reputation of Erpenius had now spread throughout all Europe; and several princes, the kings of England and Spain, and the archbishop of Seville, made him the most flattering offers; but he constantly refused to leave his native country, and died of a contagious distemper Nov. 13, 1624, at the early age of forty. Erpenius left several works, which are doubtless disfigured by imperfections; but if we consider that he lived in an age when pursuits like his were exceedingly rare, if not wholly new, and that he had little or no assistance of any kind; and if we judge him, not according to the present state of oriental literature, but by what he actually achieved under every disadvantage, we must conclude that, in the immensity and difficulty of his labours, he probably surpassed all the orientalists who have followed him; and that if his career had not been cut short by a premature death, he would have greatly enlarged the boundaries of that literature of which his name will always remain one of the greatest ornaments.

The following is a list of his works:—*Oratio de Lingua Arabica*, Leyden, 1613, in 4to; *Annotationes in Lexic. Arab. Fr. Raphelengii*, ibid. 1613, in 4to; *Grammatica Arabica, quinque libris methodice explicata*, ibid. 1613, in 4to; *Proverbiorum Arabicorum centuriæ duæ, ab anonymo quodam Arabe collectæ*, ibid. 1614 and 1623, in 8vo; *Locmani sapientis Fabulæ et selecta quædam Arabum Adagia, cum interpretatione Latina et notis*, ibid. 1615, in 8vo; *Pauli Apost. ad Romanos, Arabice*, ibid. 1615, in 4to; *Novum D. N. J. C. Testamentum, Arabice*, ibid. 1616, in 4to; *Pentateuchus Mosis, Arabice*, ibid. 1622; *Historia Josephi Patriarchæ ex Alcorano, cum triplici versione Latina et scholiis Th. Erpenii, cujus præmittitur Alphabetum Arabicum*, ibid. 1617, in 4to; *Grammatica Arabica dicta Giarumia et libellus centum regentium cum versione Latina et Commentariis*, ibid. 1617, in 4to; *Canones de litterarum Alif, Waw, et Yè apud Arabes naturo et permutatione*, ibid. 1618, in 4to; *Rudimenta Linguæ Arabicæ; accedunt Praxis Grammatica et consilium de studio Arabico feliciter instituendo*, ibid. 1620, in 8vo; *Orationes tres de linguarum Ebreæ et Arabicæ dignitate*, ibid. 1621, in 12mo; *Historia Saracenica*, ibid. 1625, in fol.; *Grammatica Ebræa Generalis*, ibid. 1621, in 8vo; *Grammatica Syra et Chaldæa*, ibid. 1628; *Psalmi Davidis, Syriace*, ibid. 1628; *Arcanum punctuationis revelatum et Oratio de nomine Tetragrammato; Versio et Notæ ad Arabicam Paraphrasin in Evang. S. Joannis*, Rostock, 1626; *De Perigrinatione Gallicâ utiliter instituenda tractatus*, ibid. 1631, in 12mo; *Præcepta de Lingua Græcorum communi*, Leyden, 1662. Erpenius had projected several other works, particularly an addition of the Koran with notes, and an oriental library; and in the prefaces of his grammars he also speaks of a *Thesaurus Grammaticus*, which, however, has not seen the light. For further information respecting this celebrated orientalist, the learned reader may consult Vossius, *Oratio in obit. Th. Erpenii*, Leyden, 1625, in 4to, and Scriverius, *Manes Erpeniani, quibus accedunt Epicedia variorum*, ibid. 1625.

ERPETOLOGY, that part of natural history which treats of reptiles. See Reptilia.

ERRATIC (*errare, to wander*), wandering, not stationary. This term is applied to the planets as distinguished from the fixed stars. Geologists give the name of *erratic blocks* to those weather-worn and more or less rounded fragments of the harder rocks which are found scattered over the surface of the earth at great distances from the places whence they are supposed to be derived. Those of a middling size are usually termed *boulders*.

ERRHINE (ἐν and ῥίν, *the nose*), any medicine to be snuffed up the nose in order to promote the natural discharge.

ERROR, in *Philosophy*, a mistake of the judgment. The causes of error are reduced by Locke into these four: want of proofs; want of ability to use them; want of will to use them; and wrong measures of probability.

Error, in *Astronomy*, the amount of difference between the positions of any of the celestial bodies as determined by calculation and by observation.

Error, *Writ of*, in *Law*, a writ founded on an alleged error in judgment, which carries the suit to another tribunal for redress.

ERSE, a name given to the language spoken by the descendants of the Gaels or Celts in the Highlands of Scotland; the Highlanders being supposed by their Gothic neighbours to be an *Irish* colony, who thence called their language *Erse*, which is a corruption of the word *Irish*. The term *Gaelic* is that invariably applied to their language by the Highlanders themselves. See LANGUAGE.

ERSKINE, EBENEZER, a celebrated divine, and founder of the Secession Church in Scotland, was born June 22, 1680, according to one account at the village of Dryburgh, but according to another, at the Bass, where his father, who had been ejected in 1662 from his charge in Northumberland, was for some time a prisoner. He received his education at Edinburgh, and was settled in 1703 in the parish of Portmoak. There he remained for twenty-eight years, after which, in the autumn of 1731, he was translated to Stirling. Previously to this period, however, his extraordinary popularity had made him an object of jealousy to the clergy generally, who entertained a peculiar fondness for the abjuration oath, lay patronage, and legal theology. For his vigorous defence of the evangelical doctrines contained in the *Marrow of Modern Divinity*, Erskine received the rebuke of the Assembly, and was exposed to the most vehement abuse both in the church courts and from the public press. A sermon which he preached on lay-patronage before the Synod of Perth in 1733 furnished new grounds of accusation, and he was compelled to shield himself from rebuke by appealing to the General Assembly. Here, however, the sentence of the synod was confirmed; and after many fruitless attempts to obtain a fair hearing, he, with Wilson, Moncrief, and Fisher, were suspended from the office of the ministry by the commission in November of that year. Against this sentence the four brethren protested, and constituted themselves into a separate church court, under the name of the Associate Presbytery. It was not, however, till 1739 that they were again summoned before the assembly, when appearing in their corporate capacity they declined the authority of the church, and were deposed in the following year. They received numerous accessions to their communion, and remained in harmony with each other till 1747, when a division took place in regard to the nature of the oath administered to burgesses. Erskine continued to preach to a numerous congregation in Stirling till his death, which took place in 1756. His published works consist chiefly of sermons.

ERSKINE, *Ralph*, brother of the preceding, was born at Monilaws in Northumberland, March 18, 1685. Like Ebenezer he probably studied at Edinburgh, and having been licensed in 1709, he was placed as assistant minister at Dunfermline in 1711. Like him, too, he was a fearless advocate of evangelical opinions, and a stern opponent of ecclesiastical tyranny. This led him to homologate the protests which his brother laid on the table of the assembly, although he did not formally withdraw from the establishment till 1737. He sided with his brother in asserting the lawfulness of oaths administered to burgesses, but did not long survive the rupture which followed that unhappy controversy. He died after a short illness Nov. 6, 1752, being then in the sixty-eighth year of his age. His three sons, who lived to be ministers of the Secession Church, died in the prime of life. The works of Ralph Erskine consist of Sermons, Poetical Paraphrases, and Gospel Sonnets.

ERSKINE, *Thomas, Lord Erskine*, a distinguished lawyer and statesman, was the third and youngest son of David Henry Erskine, tenth earl of Buchan. He was born in Scotland, and received his education partly at the high school of Edinburgh, and partly at the university of St Andrews. From the contracted resources of his family, it was necessary for him to fix upon a profession. He chose the navy, and having embarked at Leith as a midshipman, he quitted his native country, which he did not revisit until a few years before his death. In the navy he experienced no advancement, and, after four years' service, he entered the army in 1768. In 1770 he married, and shortly after this event he accompanied his regiment to Minorca, where he remained during three years. It is not certain whether his abilities as an officer ever rendered him conspicuous, but the versatility of his talents, and the acuteness of his intellect, early gained for him a high reputation. By the earnest persuasion of his mother, who, it would appear, was a woman of more than ordinary penetration, he was induced to quit the army after six years of military probation. The legal profession was the one which appeared best adapted for the character of his mind; and in 1777 he entered as a fellow commoner at Trinity College, Cambridge, for the purpose of obtaining a degree, which he was entitled to as the son of a nobleman, and thereby of shortening his passage to the bar. At the same time he entered himself as a student at Lincoln's Inn. In 1778 he was called to the bar, where his success was both immediate and brilliant. In a case of libel, in which he advocated the cause of Captain Baillie, the defendant, he displayed so much eloquence and talent, that thirty retainers were put into his hand by attorneys before he left the court. A few months after this event he was chosen to appear at the bar of the House of Commons, as counsel against Lord North's bill to restore to the universities the monopoly in almanacks. The bill was lost by a large majority, and the speech which Erskine made upon the occasion so established his reputation for forensic skill, that he was from this period engaged, either on one side or another, in every case of importance, during a practice of twenty-five years. To this period also belongs his famous speech in defence of Lord George Gordon, which procured the acquittal of his client, and proved for the time a death-blow to the tremendous doctrine of constructive treason. In May 1783 he received a silk gown, and the same year was elected member of parliament for Portsmouth, for which borough he was on every election re-chosen, until his advancement to the peerage rendered that honour unnecessary. He was soon after chosen attorney-general by the then Prince of Wales. There is nothing, however, which reflects so much honour on his memory as his exertions in defence of the privileges of juries. The rights of those *pro tempore* judges he strenuously maintained upon all occasions, but especially in the celebrated trial of the Dean of St Asaph, for libel, when Justice Buller refused to receive the verdict of *guilty of publishing only*, as returned by the jury. In 1789 another opportunity was afforded him to display his peculiar powers. This was the defence of Mr Stockdale, a bookseller, who was tried on an information filed by the attorney-general, for publishing what was charged as a libellous pamphlet in favour of Mr Hastings. The situation of the latter, whose celebrated but protracted trial was then dragging its slow length along, gave Erskine admirable scope for that animated appeal to the feelings, by which his speeches are so much distinguished. It is one of his finest orations; and, whether we regard the wonderful skill with which the argument is conducted, the soundness of the principles laid down, and their happy application to the case, the vividness of fancy with which these are illustrated, and the touching language in which they are conveyed, it is justly to be regarded as a consummate specimen of the art of addressing a jury. This masterly defence procured a clear acquittal for Stockdale, although the fact of publication was admitted. Not long afterwards he advocated the cause of Mr Perry, editor of the *Morning Chronicle*, who was also charged with publishing what the jealous loyalty of those times construed into a libel; and his speech produced a similar result. But the most arduous effort of his professional life arose out of the part cast upon him, in conjunction with Mr (afterwards Sir Vicary) Gibbs, in the

trials of Hardy, Tooke, and others, for high treason in 1794. These trials lasted several weeks, and the ability displayed by Mr Erskine upon this memorable occasion was acknowledged and admired by men of all parties. His speech in defence of Mr Frost, which, however, preceded those above mentioned, is another of those almost miraculous exertions, which, in that momentous crisis, Mr Erskine made for the liberties of his country. Frost was accused of uttering seditious words, which, however, turned out to have been spoken at random in a coffee-house whilst the accused was in a state bordering on intoxication. In the violence of that day, the exertions of Erskine failed of their accustomed effect, and Frost was found guilty. But the impression of his defence was not lost; and it deterred the government from risking its credit on such precarious speculations, until, as we have noticed, the charges of high treason were brought forward, when the whole force of the bar was marshalled against the prisoners, and every effort used to beat down and paralyse their undaunted defender.

Erskine was a warm partizan of Fox, and the liberal party of that time. He strenuously opposed the war with France, and published a pamphlet against it, entitled *A View of the Causes and Consequences of the War with France*, which had an immense sale. In 1802 the Prince of Wales not only restored him to his office of attorney-general, of which he had been deprived, but made him keeper of the seals for the duchy of Cornwall. On the death of Pitt in 1806, when Lord Grenville received orders to form a new administration, Erskine was created a peer, by the title of Lord Erskine, of Restormel Castle in Cornwall, and elevated to the dignity of lord high chancellor of Great Britain. His previous experience in the courts of common law scarcely fitted him for the judicial functions of this dignified office; but there seems little doubt that his natural quickness of intellect would have triumphed over every difficulty, had not a dissolution of the administration of which he formed part been accelerated by the obstinacy of the king on the subject of the Catholic claims. His public career may be said to have terminated with this event, and the remainder of his life was undistinguished by any great exertion, whilst it was unhappily embittered by pecuniary difficulties, which were enhanced, it is said, by an unfortunate second marriage. His mind, however, retained its native elasticity, and in his retirement he employed himself in editing several of the state trials. He also wrote the preface to Fox's speeches, a political romance entitled *Armata*, and several pamphlets in support of the Greek cause. Whilst accompanying one of his sons by sea to Edinburgh, he was seized with an inflammation of the chest, which compelled him to land at Scarborough. He reached Scotland by easy stages, but expired on the 17th of November 1823, at the seat of his brother, a few miles from Edinburgh. The peculiar character of Lord Erskine's eloquence has already in some measure been described. In his capacity of advocate he possessed the power of summoning upon the instant all the resources of his mind, and bringing them to bear upon the subject before the court with extraordinary effect. In this respect his speeches bear a resemblance to those of Mr Pitt, whilst they far surpass them in impassioned fervour, in brilliancy of imagination, in copiousness of imagery, and in that quality of mind expressed by the emphatic word genius. His dexterity was likewise unrivalled at the bar; and these qualifications, united with a courage which nothing could daunt, and a firmness which was never overcome, rendered him almost irresistible on the defensive side of political persecution. Amidst all the struggles of the constitution in parliament, in council, and in the field, during that momentous period of our national history, there was no man to whose individual exertions it owed so much as to those of this celebrated advocate.

By his first wife, who died in 1805, Lord Erskine had three sons and five daughters. His speeches have been frequently printed; the last edition is in 5 vols. 8vo. (J. F. S.)

ERUGINOUS (*ærugo, rust of copper*), partaking of the substance or nature of copper, or the rust of copper.

ERYMANTHUS, a lofty and extensive mountain range on the N.W. frontier of Arcadia, which it separated from Achaia and Elis. The highest points of this range are now called Olonos and Kalefoni, the former of which is about 7300 feet above the level of the sea, and the latter about 6250. Erymanthus is famous in the Greek mythology as the haunt of the wild boar whose destruction was one of the labours imposed upon Hercules by Eurystheus. Of the four streams which had their rise in Erymanthus, the Pirus and Selinus flowed northwards into Achaia, the Peneus westwards through Elis, and the cognominal Erymanthus southwards into Arcadia, where, after uniting with the Achelous, it joined the Alpheus.

ERYSIPELAS, or ST ANTHONY'S FIRE, a redness of the skin attended with a sensation of heat or burning, and having a remarkable tendency to spread over the surface of the body. When unattended with constitutional symptoms, it is styled *erythema*. In the three other forms there is more or less constitutional disturbance. These forms are, 1*st*, *Simple erysipelas*, where there is a tendency to the formation of vesicles which break or dry up, leaving the skin either whole or slightly abraded. This form is often erratic, flying from one part of the body to another, lingering about the person for weeks or months. 2*d*, *Phlegmonous erysipelas*, in which the subjacent cellular tissue is involved, and often terminating in the formation of collections of matter, or even sloughing of the tissues. 3*d*, *Œdematous erysipelas*, attended with an effusion of serous fluid below the affected parts, and occurring chiefly in persons of impaired constitutions. In some situations this form is apt to terminate in gangrene. In the great majority of cases of this affection, a brisk purgative followed by tincture of the muriate of iron, fifteen to thirty drops five to ten times daily, combined with belladonna, if the disease has a tendency to spread, rapidly arrests the disease. In the phlegmonous form, hot fomentations of sugar of lead and opium, or of hot whisky and water, afford great relief, though, if matter form, it must be let out by free incisions. The œdematous form requires the more liberal use of iron and quinine, with laxatives and generous diet.

ERYTHRÆ, one of the Ionian cities of Asia Minor, was situated on the sea-coast at about equal distances between the mountains Mimas and Corycus, and directly opposite the island of Chios. Round the town was a rugged and broken territory, in which excellent wine was produced. Erythræ does not seem to have ever attained that power which might have been expected from its position and resources. In the naval battle fought by the Ionian confederates before Miletus, in 494 B.C., the Erythræans had only eight ships engaged, while the Chians had a hundred. They ultimately appear to have owned the supremacy of Athens, but towards the close of the Peloponnesian war they threw off their allegiance to that city. Erythræ was famous as the birth-place of two celebrated prophetesses, one of whom, by name Sibylla, appears to have lived during the early historical period of the city; the other, whose name was Athenais, flourished in the time of Alexander. The site of Erythræ has been accurately ascertained; and considerable remains of its most important public buildings have been discovered at the modern Ritri.

ERYTHRÆUM MARE. See RUBRUM MARE.

ERYX, a city and mountain in the west of Sicily, six miles from Drepana, and a short distance from the seashore. The mountain, now called Monte S. Giuliano, rising to the height of a little more than 2000 feet, appears from its isolation a great deal higher than it really is. On its summit stood a celebrated temple of Venus, called from that

circumstance Erycina, under which name that goddess is frequently mentioned by the Latin poets. The possession of the town of Eryx was contested by the Syracusans and Carthaginians. A great battle was fought off the town between the fleets of the two nations, in which the Syracusans were victorious. The town subsequently changed hands more than once, but it seems to have owned the Carthaginian supremacy at the time of the expedition of Pyrrhus, B.C. 278. Though taken by that monarch, it once more fell into the hands of its original conquerors, who retained it till the close of the first Punic war.

ERZEROUM, or ERZRUM, an important town of Turkish Armenia, and capital of an extensive pashalic of the same name. It is situated in an extensive plain, 6200 feet above the sea, about a mile from the Karasoo or western branch of the Euphrates, and 140 miles S.E. of Trebizond. The town is large but irregularly built, and the streets, like those of all Turkish towns, unpaved, filthy, and infested with dogs. The houses are mostly built of a dark gray volcanic stone, cemented with mud, and strengthened with wood inserted horizontally at certain distances in the walls, which, being rarely plastered, give the town a dull and sombre appearance. Some of the apartments in the larger houses are handsome, and the ceilings of carved wood, gilt, and painted. The roofs are flat, and covered with several feet of earth, which renders them warm in winter and cool in summer, but not impervious to rain and melting snows in the spring. The only exception to this is the custom-house, which has a slanting tiled roof. The town contains twenty-eight khans, thirteen public baths, seventy mosques and mesjids (small mosques or chapels), a Roman Catholic, a Greek, and a large and handsome Armenian church. It is well supplied with excellent water, conducted through wooden pipes from springs issuing from the Palan Duken mountain, to the numerous fountains which are to be found in every part of the town. Towards the south the town is protected by a citadel, surrounded by a double wall flanked with towers and a ditch. The walls, however, are in a state of decay, and could offer but a feeble resistance to an invading force. It is besides commanded by the high hill or mountain called Palan Duken. The principal imports are British and Swiss manufactures, colonial produce, iron, tin, madder root, indigo, and galls. The exports consist of furs, goat and sheep skins, and wool, buffalo hides, wax, tallow, pipe-sticks, copper, and lead. The principal trades carried on are tanning, dyeing morocco (red and yellow), preparing sheepskins for pelisses, making horse shoes and nails, and iron and copper utensils. British manufactures (chiefly cottons) to the value of two millions sterling annually pass through Erzeroum from Trebizond to Persia. The population was estimated in 1854 at 50,000, as follows; Turks 30,000, Orthodox Armenians 5000, Catholic Armenians 2300, Persians 1200, Greeks 300, Russian subjects, consisting principally of Armenians, with a few Georgians and Jews, 1200, and the garrison force then stationed there, 10,000. At the time of the Russian invasion in 1828 it was estimated to contain about 80,000 inhabitants.

ERZGEBIRGE (*Ore Mountains*), a mountain chain of Germany, forming the boundary between Saxony and Bohemia, and extending in a south-western direction from the Elbe to the source of the White Elster, where it is connected with the Fich-tel-gebirge. It is about 120 miles in length, with an average breadth of 30 miles. The southern declivity is generally steep and rugged, while the northern slopes more gradually towards the great plain of Northern Germany. The highest points are Keilberg, 3920, and Fichtelberg, 3835 feet above the level of the sea. This range consists chiefly of granite and gneiss, and is rich in metallic ores of various kinds. Gold is found in several places; while the silver, iron, tin, lead, and cobalt mines are extensive and valuable. Copper is found, but not abundantly, and there is some arsenic, brimstone, vitriol, quicksilver, antimony, bismuth, &c.

ESARHADDON, the son and successor of Sennacherib, king of Assyria. He is the Sacherdon or Sarchedon of Tobit, and the Asaradinus of Ptolemy's Canon. By Hales he is regarded as identical with the first Sardanapalus, and he is generally supposed to be the Asnapper of Ezra (iv. 10).

ESAU, the eldest son of Isaac, from whom the right of inheritance was transferred even before his birth to his brother Jacob. Having sold the actual birthright when on the point of starvation, he was defrauded of the ratification of it by a stratagem of his brother, and instead of being the father of the promised seed he became the head of the Edomites.

ESCALADE, or SCALADE (Lat. *scala, a ladder*), in the military art, an assault on a fortified place, in which ladders are used to pass a ditch or to scale a rampart.

ESCAPEMENT, in *Clock-work*. See CLOCK AND WATCH WORK.

ESCARPMENT (It. *scarpa, a slope*), in military language, ground cut away nearly vertically about a position, in order to render it inaccessible to the enemy. The escarp or scarp of a ditch is that side of it which forms the exterior of the rampart. See FORTIFICATION.

Escarpment is applied in geology to an abrupt or precipitous surface of a rock, hill, or high ridge of land.

ESCARTELED, in *heraldry*, cut or notched in a square form; as a cross.

ESCHALOT (Fr. *échalote*), a small kind of onion or garlic, *Allium ascalonicum*.

ESCHAROTIC, any caustic application; a medicine that sears or destroys flesh.

ESCHEAT, in *Law*, any land or tenement that casually falls to a lord within his manor.

ESCHEVIN, or ECHEVIN, in the French and Dutch polity, a magistrate elected by the inhabitants of a city to manage their common concerns, and promote the good order and decoration of the city.

ESCHWEGE, a town of Hesse-Cassel, province of Lower Hesse, on the Werra, 24 miles E.S.E. of Cassel. Pop. 6050. It is generally well built, and has an old castle, town-hall, hospital, and several Protestant churches. It has manufactures of leather, tobacco, and musical instruments, and some trade by means of the river.

ESCHWEILER, a town of Rhenish Prussia, government of Aix-la-Chapelle, and nine miles E.N.E. of the town of that name. It has manufactures of woollens, silks, needles, wire, &c. Pop. (1849) 3148.

ESCUAGE, or SCUTAGE (Fr. *écu* for *escu*; Lat. *scutum*), in *Feudal Law*, service of the shield; a species of tenure by knight service, by which a tenant was bound at his own expense to follow his lord to war. This kind of service was afterwards commuted for a pecuniary satisfaction. Escuage, together with the other appendages of military tenures, was abolished in England by 12th Car. II. cap. 24.

ESCULENT (*esca*, food), eatable, fit for the food of man; as esculent plants, esculent fish, &c.

ESCURIAL, or ESCORIAL, a monastery and royal palace in Spain, 25 miles N.W. of Madrid, in a country of which the surface is covered with rocks, and where there is little shelter from the winds, which makes this elevated place very cold in the winter months. It was dedicated to St Lawrence by Philip II. on occasion of his having gained the battle of St Quentin, in 1557, on the day sacred to that saint. It is whimsically built in the form of the gridiron on which that saint is said to have been broiled alive. The work was begun by Juan Bautista de Toledo in 1563, and completed by his pupil Juan de Herrera in 1584.

The cross bars of the gridiron are represented by ranges of buildings separated by intervening courts, and which were formerly inhabited by monks and ecclesiastics; but after the sequestration of the convents these buildings were allowed to fall into a dilapidated state, and though some-

thing has been done towards repairing them, they are still untenanted.

The main portion of the building is 740 Spanish feet long, and 580 in breadth. The projection which forms the royal palace is 460 feet in length. The height of the edifice is about sixty feet, and at each angle is a square tower 200 feet high. It is one of the largest, and perhaps one of the most tasteless, buildings in Europe, though grand from its size.

The church, in the centre of this enormous mass of stone, is very large, rich, and of a species of architecture calculated to inspire the mind with awe on entering it. The high altar is most profusely adorned with marbles, agates, and jaspers, and the gold and silver furniture are of the most costly kind. The cupola which covers this church is the most correct object in the whole of the vast pile. The Pantheon, a repositary beneath this church, is the place of interment for the royal family, whose remains are deposited in tombs of marble placed in niches, one above another. The richest part of this edifice, however, was that which contained the valuable pictures to be seen in almost every part of it, and which altogether formed the best collection of the productions of the first masters that any place in Europe displayed. We speak of what it was; for the French, when in possession of the Escurial, removed many of its best treasures, which included the finest productions of Rubens, Titian, Spagnoletto, Raffaelle, Baroccio, Velasquez, Murillo, and others. The most valuable treasures of the Escurial, however, are the immense collection of ancient manuscripts preserved in the library, especially those of the Arabian writers. An account of these will be found under the head LIBRARIES.

There are some good statues, busts, and medallions in the Escurial. The statue of St Lawrence, the patron, is excellent, and said to be an antique; but some of the best of the Spanish artists have averred that the head was from an ancient statue of Bacchus, and the body of more modern workmanship, but nearly approaching in execution to the original portion. These kinds of treasures were, however, less valued by the monks than the autographs and relics of several of the saints, which are preserved here, and exhibited with great veneration.

As this place has been chiefly occupied by the royal family for the sake of the sports of the field, it has been generally inhabited during the autumn and winter months, when, from its exposed situation, it is a most uncomfortable residence. A town has been built near the monastery; but it has never flourished, and has only about 1300 inhabitants.

ESCUTCHEON, or SCUTCHEON (Fr. *escusson;* Lat. *scutum*), the shield on which a coat of arms is emblazoned. Most nations, even from the remotest antiquity, have distinguished their shields by certain devices painted on them; and to be able to display these was a mark of distinction permitted only to such as had performed some honourable action. See HERALDRY.

ESDRAS, BOOKS OF. In several manuscripts of the Latin Vulgate, as well as in all the printed editions anterior to the decree of the Council of Trent, and in many since that period, there will be found four books following each other, entitled the 1st, 2d, 3d, and 4th Books of Ezra. The first two are the canonical Books of Ezra and Nehemiah, the 3d and 4th form the subject of the present article. They are the same which are called 1st and 2d Esdras in the English authorized version of the Apocrypha.

The Third Book of Ezra is found in all the manuscripts of the Seventy, where it is called the *first* book, and precedes the second or canonical Ezra, which, in this version, includes the Book of Nehemiah. It contains 109 κεφαλαια. It is little more than a recapitulation of the history contained in the canonical Ezra, interspersed with some remarkable interpolations, the chief of which are chap. i., taken from 2 Chron. xxxv. xxxvi., part of the last chapter, from Nehem. viii., and the narration of the themes or sentences of Zorobabel and the two other young men of Darius's body-guard (3 Esd. iii. 4). The book is more properly a version than an original work. The style is acknowledged to be elegant, and not unlike that of Symmachus. This book was made use of by Josephus, who cites it largely in his *Antiquities*, but nothing further has been ascertained respecting the age either of the original or the translation. It is cited by Clemens Alexandrinus (*Stromata*, i.), the author of the *Imperfect Work on Matt.* (Hom. i.), Athanasius (*Orat.* iii. *cont. Arianos*), and by Cyprian (*Epist. ad Pompeium*). From the circumstance of Jerome's having declined to translate the third and fourth Books of Ezra, they are (with the exception of the Book of Job and the Psalms) the only portions either of the canonical or apocryphal writings of the Old Testament which have been preserved to us entire in the old Latin translation.

This book does not appear to have been included in the catalogue of any council, nor has any portion of it been read in the offices of the church. Having been rejected as apocryphal by the Council of Trent, it has been removed, together with the fourth book, in the Sixtine and Clementine editions of the Vulgate, to the end of the volume, with the observation that they are thus retained in order to "preserve from being altogether lost books which had been sometimes cited by some of the holy fathers."

The Fourth Book of Ezra is quite of a different character from the third, and it has been even doubted whether it more properly belongs to the Apocrypha of the Old or the New Testament, but the circumstance of the author's personating the celebrated scribe of that name has been supposed to have led to its obtaining a place in the former. It consists of a number of similitudes or visions, resembling in some passages the Apocalypse. The descriptions are acknowledged to be sometimes most spirited and striking, occasionally rising to great sublimity of thought, energy of conception, and elegance of expression (Lee's *Epistolary Discourse;* Laurence's *Æthiopic Version of Ezra*). This would probably be still more apparent had we the book in the original, for it seems highly probable that this, as well as the former book, is a translation from the Hebrew or Chaldee (Morini *Exercit. Bibl.* lib. ii. p. 225; Fabricii *Cod. Pseud. V. T.* iii. 189). But neither this nor the Greek version, which was known to Clemens Alexandrinus in the second century (*Stromata*, iii.), are any longer in existence, and the book was supposed to have been preserved only in the old Latin Ante-Hieronymian Version, until the middle of the seventeenth century, when an Arabic version was discovered in the Bodleian Library by Mr Gregory, a translation of which, by Simon Ockley, the Arabic professor at Cambridge, was published in 1711 by Mr William Whiston (*Primitive Christianity*, vol. iv.) Subsequently an Ethiopic version, which, although known to Ludolf, was concealed from the world, was published for the first time, accompanied by a Latin and English translation, by the late Archbishop Laurence, in 1820. The book is ascribed to the *prophet* Ezra by Clemens Alexandrinus (*Strom.* b. iii.), who looked upon it as canonical and divine, as did Irenæus, Tertullian, and Ambrose, who has made several quotations from this "prophet," as he also styles him (Sixtus Senensis, *Biblioth. Sanct.*), and among others, one which no longer exists in the Latin, but is found both in the Arabic and Æthiopic (Laurence's *Ezra*). Jahn observes that the "Catholics have made many martyrs on its authority" (*Heb. Commonwealth*, b. v.) Pico de Mirandula considered this book as divinely inspired, and Gaspar Zamora placed it in his Concordance between Nehemiah and Maccabees. Among modern writers, Whiston (*Authentic Records*), and others both before and since his time, have considered this book as an inspired composition, and as the genuine pro-

duction of Ezra. (See *Prophecy that hath lain hid above these* 2000 *years; Middle State of the Souls departed; the Prophecies of the Second Book of Esdras,* by Sir John Flover.)

Jahn supposes the author of the Fourth Book of Ezra to have been a Jew educated in Chaldea, who borrowed his style from Daniel, and who, having become a Christian, still retained his reverence for Cabalistic traditions. He places him in the first or early in the second century (see also Vogel's *Commentatio de quarto lib. Esdræ,* Altorf. 1795). Archbishop Laurence, on the other hand (*ut supra*), conceives that the author was a Jew who never changed his creed, and endeavours to destroy the two main arguments in favour of the work having emanated from a Christian: one of these is founded on the remarkable fact that the author speaks of Jesus by name (chap. vii. 28), the other on the circumstance of his being plainly conversant with the Christian Scriptures. As to the former, Dr Laurence appeals to the Ethiopic version, where the text is (not *my Son Jesus,* but) "*my Messiah*" shall be revealed, which is confirmed by the Arabic reading, *my Son Messiah.* The archbishop considers these texts both in the Latin and Arabic to be interpolations or explanatory glosses. The argument derived from the author's acquaintance with the Christian Scriptures is principally founded on the first two chapters, which are wanting in both the Arabic and Ethiopic versions, and in most manuscripts of the Latin are placed at the beginning of the Third Book of Ezra, or at the end of Nehemiah, where they form a distinct book. The last two chapters are equally wanting in these versions, and in most Latin manuscripts form a fifth book, or are otherwise clearly distinguished from the former part of the book. This fifth book is in some manuscripts divided into seven chapters, and the whole of the fourth into thirty-nine. The division into two chapters is erroneously ascribed by Dr Frank Lee to Robert Stephen, for the same division is found in the Editio Princeps by Fust and Schoeffer, printed in 1462, where also the last two chapters, as well as the first two, are incorporated into the rest of the book, and have so continued in all subsequent editions. Dr Laurence concludes from other internal grounds, that the book was written before the Christian era, after the death of Marc Antony, and before the accession of Augustus, or between the 28th and 25th year before Christ.

Dr Lee is strongly of opinion that the author of this book was contemporary with the author of the Book of Enoch, or rather that both these books were written by one and the same author. It does not appear that Josephus was aware of its existence.

ESHER, a village and parish in the county of Surrey, 15 miles S.W. of London. Here is Claremont Palace (built by the celebrated Lord Clive), formerly the residence of the Princess Charlotte, and now occupied by the widow and family of the late king of France. Esher Palace was a residence of Cardinal Wolsey, but of that splendid edifice only the gate-house now remains. Pop. of parish (1851) 1441.

ESK, the name of several rivers in England and Scotland, the principal of which are in Forfarshire and Dumfriesshire. The word is evidently a derivative from the Celtic *uisk,* water.

ESKI-SAGRA, a town of European Turkey, province of Roumelia, pleasantly situated on a declivity, on a tributary of the Zundja, 70 miles N.W. of Adrianople. It has manufactures of carpets, coarse cloth, and leather. The vicinity is highly cultivated, and there are some well frequented hot mineral baths. Pop. estimated at 20,000.

ESNE, or ESNEH, a town of Egypt. See EGYPT.

ESOPHAGUS, the gullet; the canal by which food passes into the stomach. See ANATOMY.

ESOTERIC (Inner) and EXOTERIC (Outer). These words have been much discussed with reference to the Grecian philosophy, and especially to the system of Aristotle. They have also been applied to various other schools, but always enveloped in some kind of obscurity and doubt, which philology has vainly attempted entirely to dissipate. There are particularly three schools of ancient philosophy with respect to which these words have been employed—those of Pythagoras, Plato, and Aristotle.

Little is known with certainty of the school of Pythagoras; but according to the historians of philosophy the adepts of the Pythagorean institution were divided into several classes according to the degree of their attainments; the Esoteric were those who had learnt more completely the doctrines of their master, and were received into the bosom of the society. The Exoteric were the more simple inquirers who waited without till by enduring trials and privations (among others, silence for five years), they were fitted for reception into the inner communion.

In the doctrine of Plato these two words have a meaning different from this. As they are not applied to the disciples but to the opinions of the master, it has been said that Plato had two sets of doctrines, the one to be communicated only to the more intelligent and faithful disciples, the other to be made known to the vulgar. If this were true, it would be a grave charge against the philosophy of the time of Pericles if it had dissembled its true convictions on the great questions which have always occupied the human mind; if the disciple of Socrates, frightened by the punishment of his master, had veiled the truth to give us in his dialogues only a faint and insincere reflection of his philosophic faith. But the admirable dialogues which have come down to us afford irrefragable evidence that Plato as well as his master has concealed nothing, but has given us his entire views in all their fulness and all their depth, and that all the regrets about losses and concealments are perfect chimeras.

Some have thought that the allusion made by Aristotle (*Physica,* lib. iv. c. 2) to the unwritten opinions of Plato, Ἐν τοῖς λεγομένοις ἀγράφοις δόγμασιν, referred to concealed doctrines; but it is much more likely that those unwritten dogmas were those which were but orally communicated, and not found in the dialogues only because they were less important than those which were written. Pythagoras, in the midst of a hostile and barbarous people, held a mysterious and double doctrine; Plato, in the groves of the Academy, taught such as were perfectly accessible to all, and which we now possess in his works. In these it is impossible to distinguish between the esoteric and exoteric.

This distinction is still less applicable to Aristotle than to Plato, although relatively it may appear more so, for Aristotle himself separates his works into exoteric and acroamatic or esoteric. There are many passages in which Aristotle speaks of his exoteric works; and it is in studying these carefully that we may ascertain the true meaning of the word, at least as far as relates to the Peripatetic philosophy. The result of a strict analysis will show that Aristotle never held a concealed doctrine that had any resemblance to that of Pythagoras.

In what sense then is the word *exoteric* in Aristotle to be taken if the exoteric works are not those which were delivered to the profane or vulgar, and the philosophic or acroamatic works those which were confided to the approved disciples? The difference does not refer to the nature of the teaching, much less to the readers, but only to the forms and processes of the expositions.

The exoteric and the philosophic works treat of the same subjects; in the first he only gives the elements that are more superficial and more easily understood by the less intelligent, but for the second he reserves the arguments that are difficult and weighty and most deserving the meditation of the philosopher. This we hold to be the most plausible explanation of the words *exoteric* and *acroamatic* or *esoteric* when used in relation to the Peripatetic philosophy The

words esoteric and exoteric are sometimes applied to the religious sentiment as prevailing at certain times and in various states. It was a necessary result of the position occupied by the ancient world, that in proportion as scientific culture came to be more generally diffused, the opposition noticed by Polybius between the subjective conviction of the individual and the public religion of the state became more strongly marked. The wiser part endeavoured to maintain the popular religion, merely because they recognised in it a necessary means to political ends. Strabo, who lived in the age of Augustus Cæsar, says "The multitude of women and the entire mass of the common people cannot be led to piety by the doctrines of philosophy; to effect this, therefore, superstition is necessary, which may call in the aid of myths and tales of wonder." And Seneca, in his treatise against superstition, writes, "The whole of that vulgar crowd of gods which, for ages past, a Protean superstition has been accumulating, we shall worship so as never to forget that the worship we pay them is due rather to good manners than to their own worth. All such rites the sage will observe because they are commanded by the laws, not because they are pleasing to the gods." It was impossible on any grounds of truth to establish a fellowship of religious interest between the cultivated class and the uneducated; and thus the philosophic class, while outwardly professing devotion to the popular religion, inwardly despised it as a system of superstition.

The Essenes among the Jews mingled the Chaldaic, Parsic, and Platonic doctrines, with an allegorical interpretation of the Old Testament, and it was only those who had undergone a noviciate of three years that were admitted into full communion in the mystical and ascetic rites of the society. The various sections of the Gnostics in the second and third century of the Christian church adopted the same secret mysteries to which the initiated only were admitted. (Brandis *Manuel de l'Histoire de la Philosophie Grecque et Romaine;* Ritter's *History of Philosophy; Dictionnaire des Sciences Philosophiques;* Neander's *History of the Christian Church.*)

ESPALIER (*palus, a stake*), in *Horticulture*, a kind of light frame of wood or iron, resembling a railing, on which fruit-trees and other plants are trained. The term is sometimes extended to the plants thus supported. See HORTICULTURE.

ESPALION, a town of France, capital of a cognominal arrondissement in the department of Aveyron, on the river Lot, 15 miles N.E. of Rodez. Pop. (1851) 4253. It has manufactures of woollen goods and morocco leather.

ESPARTO, a species of rush (*Stipa tenacissima*) which abounds in the south of Spain, where it is manufactured into cordage, nets, matting, baskets, sacks, &c. The light shoes called *alpargates*, so much used by the Spanish peasantry, are made of this material. Cables made of esparto are said to be excellent; and as from their lightness they float on the surface of the water, they are less liable than hempen cables to be cut or injured by a foul bottom. These cables are used exclusively in the Spanish navy.

ESPINEL, VICENTE, a Spanish ecclesiastic, born in 1544 in the province of Granada, who is now chiefly noted as having produced one of the best of those romances delineating Spanish manners, that have found imitators in other countries. This book is entitled *Relaciones de la Vida y Hechos del Escudero Marcos de Olregon*, which appeared in 1618 at Barcelona, at a period when Spanish literature was at a low ebb. Marcos is not a chivalresque *esquire*, but a simple individual who seeks his fortune by attaching himself to great men; and the object of the author is to warn young men against so degrading a course of life. The *squire* tells his own story. The incidents are not generally exciting, though amusing, and nationally characteristic; the style correct, though somewhat diffuse. Its chief interest, like that of the clever *Vida y Hechos del Picaro Gusman de Alfarache* of Aleman, is that Le Sage has not scrupled to borrow from both writers many of the incidents and characters in his admirable novel of *Gil Blas;* a circumstance which has induced an indignant Spaniard to entitle his translation into Spanish of Le Sage's work, *Gil Blas restored to his Country and his Native Tongue*, in the preface to which he denounces the barefaced plagiarism.

Espinel was noted for his musical taste, and added a fifth string to the national guitar. He was also a poet of some reputation, especially for his *Canciones* and *Redondillas.* His pastorals and elegies contain many spirited natural descriptions, though they do not abound in many original conceptions; and his versification is always harmonious.

He also translated into verse some of the odes and the *Ars Poetica* of Horace.

Espinel seems to have been neglected in his old age, for he died in great poverty at Madrid in 1634, at the age of ninety.

ESPLANADE, in *Fortification*, the glacis of the counterscarp, or the slope of the parapet of the covered-way towards the open country; but the term is now most usually applied to the void space between the glacis of a citadel and the first houses of the town.

ESPOUSALS, in *Law*, a contract or mutual promise of marriage. Marriage is termed an espousal *de præsenti.* See MARRIAGE.

ESQUILINE (*Esquiliæ*), the largest of the seven hills of Rome. See ROME.

ESQUIMAUX. See AMERICA.

ESQUIRE (Fr. *éscu*, a shield, from the Lat. *scutum*, from the Gk. σκύτος, *a hide*, with which shields were anciently covered) originally denoted the attendant or shield-bearer of a knight, and hence he was called *escuier* in French, and *scutifer or armiger* in Latin. In the days of chivalry the esquire was second in rank to the knight. Aspirants to knighthood passed through several gradations of service or apprenticeship to arms, as page, and esquire or bachelor, previous to being admitted to that honour. The esquire had several privileges, such as the right of wearing a sword and defensive armour, which last, however, differed from the full panoply of a knight; and he likewise might use heraldic bearings on his escutcheon or shield. There was also another class of esquires, consisting of those tenants by knight's service who had a right to claim knighthood, and who possessed many of its privileges. Such was the German *Ritter*, as distinguished from the *Ritter geschlagen* or dubbed knight.

Respecting the title of esquire in modern times, it is somewhat unsettled, says Blackstone (book i. chap. 12), what now constitutes a right to this distinction, or who is a real esquire; for it is not an estate, however large, that confers this rank upon its owner. In some old writers mention is made of esquires by creation, by investiture with a silver collar of SS., to which ceremony was added the putting on of a pair of silver spurs. It appears that in England this title appertains by right of birth to the following persons: the sons of younger sons of dukes and marquises; the younger sons of earls, viscounts, and barons, and their eldest sons; the eldest sons of baronets and of knights. The following also are reputed esquires: officers of the queen's court and household; officers of the navy and army, down to the captain inclusive; doctors of law; serjeants and counsellors at law; physicians; justices of the peace while in commission; and the sheriffs of counties for life. The heads of many ancient families likewise are deemed esquires by prescription. The title, however, is now usually given to all professional and literary men, and is very generally affixed, as in the superscription of letters, to the names of persons who live in the rank of gentlemen. Hence the distinction it formerly conferred is virtually destroyed.

ESSAYING, or ASSAYING. See ASSAYING.

ESSECK, ESSEG, or ESZEK (Slav. *Oszek*, anc. *Mursia* or *Mursa*), the capital of Slavonia, and one of the most strongly fortified towns in the Austrian dominions, is situated on the right bank of the Drave, 13 miles from its confluence with the Danube. Mursia was founded by the Emperor Hadrian in A.D. 125, and became afterwards the residence of the Roman governors of Lower Pannonia. It was erected into a bishopric by Constantine in 335. The present fortress was erected, upon the site of a previous one, by the Emperor Leopold I., between 1712 and 1719. It is not extensive, but is well constructed, containing many massive buildings, including an arsenal, and barracks capable of accommodating 30,000 men. It is surrounded by a broad esplanade, and is strengthened by works on the opposite side of the river. To the N.W. of it stands the *Ober Varos*, or Upper Town, with which it communicates by an avenue 1100 paces long. On the E. is the *Unter Varos*, or Lower Town, occupying the site of the ancient *Mursia;* while on the W. is the New Town. Esseck has 1 Greek and 5 Roman Catholic churches, 4 chapels, town-house, county hall, Catholic gymnasium, a High and a Greek school, and several monasteries. A long wooden bridge crosses the Drave and the swampy ground on the opposite side of that river. Pop. about 12,500, chiefly employed in the spinning of silk. Esseck is a steam-packet station, and a place of considerable trade in corn, cattle, and raw hides.

ESSEDARII, in *Roman Antiquity*, gladiators who fought in a heavy kind of chariot called *esseda* or *essedum*. The *esseda* (which derived its name from the Celtic word *ess*, signifying a carriage) was a ponderous kind of chariot much used in war by the Gauls, the Belgæ, and the Britons. It differed from the currus in being open before instead of behind; and in this way the owner was enabled to run along the pole, from the extremity of which, or even from the top of the yoke, he discharged his missiles with surprising dexterity. A large body of *essedarii*, by which name the British warriors who drove these chariots were distinguished by the Romans, were taken captive in battle, and occasionally exhibited in the gladiatorial shows at Rome, to the great delight of the people, who beheld with admiration the feats performed by these bold and skilful charioteers. (Cæs. *Bell. Gall.* iv., v.; Tacit. *Agric.* xii.; Suet. *Calig. Claud.;* Cic. *Fam.* vii.)

The Romans applied the same name to a light carriage of similar construction, which was drawn by a pair of horses, and adapted for convenience and luxury. It probably differed little from the *covinus*, except that the latter was closed overhead.

ESSEN, a town of Rhenish Prussia, government of Düsseldorf, on the Berne, and near the Cologne and Minden Railway, 20 miles N.E. of Düsseldorf. Pop. (1849) 8813. It is surrounded by walls; is the seat of a mining board and a municipal court of justice; and has several Protestant and Roman Catholic churches, an old Capuchin convent, a gymnasium, hospital, and orphan asylum. The town is thriving, and has manufactures of woollen and linen goods, fire-arms, steam-engines, iron and steel wares, leather, and vitriol. In the vicinity are some valuable coal mines.

ESSENCE (from *esse, to be*), that which constitutes the particular nature of a being or substance, or of a genus, and which distinguishes it from all others. Locke makes a distinction between *nominal* and *real* essence. The nominal essence, for example, of gold, is that complex idea expressed by gold; and its real essence is the constitution of its insensible parts, on which its properties depend, and which is unknown to us.

Essence is also used to denote the predominant qualities of any plant or drug extracted, refined, or rectified from grosser matter; or, more strictly, a volatile essential oil.

ESSENCE D'ORIENT, a pearly-looking substance, employed in the manufacture of artificial pearls. It is procured chiefly from the scales of the blay or bleak, a fish of the genus *Cyprinus*, and is prepared by the simple process of steeping the scales in water, and rubbing them with the hands until the glistening matter is separated. This is again washed, and then thrown upon a sieve, that the moisture may drain off. This substance, while in a viscid state, readily putrefies; but this tendency may be counteracted by liquor ammoniæ, which coagulates the mucilaginous matter.

ESSENES, one of the three great Jewish sects, of which the other two were the Pharisees and the Sadducees. The derivation of the name Essenes is by no means certain. Philo deduces it from ὅσιος, "holy;" others find its origin in the Chaldee word "to heal" while others give the preference to a Syriac word signifying "pious." These sects sprung up in the decline of the Jewish state, after the Babylonish captivity, and were influenced in their rise and spread not less by ascetic philosophy than by the national degradation and the decay of morality.

While the Pharisees gave their countenance to sustain the past indiscriminately, and the Sadducees rejected all that was traditionary and adventitious, the Essenes sought to originate a moral influence, a moral and religious order; while the Pharisees partook more of the character of a political party, and the Sadducees exhibited not a few of the features of a sect.

The Essenes were ascetics, and rejected marriage along with the ordinary social pleasures of life. To recruit their ranks they selected the most promising of the children of others. Riches, too, they held in contempt, and whatever they had they were ready to share with others. Every newcomer put his property, whatever it was, into the common stock; whence his wants were afterwards gratuitously supplied. When they entered any strange city, their brethren received and entertained them as if they had come to their own property; and, in order that travellers might not suffer want or disappointment, there was in every city one of the brethren, who was specially charged to provide them with food, clothing, and other necessaries. These duties of hospitality, however, could not have been onerous, if, as Josephus states, the Essenes did not change their shoes or garments till they were worn out and tattered.

The account which Josephus has given of their pious exercises, and of their daily engagements, is striking and characteristic. Rising before the sun, they abstained from all ordinary conversation, and put up their ancestral prayers, not forgetting to beg for a renewal of the light of day. Then, under the supervision of curators or foremen, they laboured diligently till eleven o'clock in the forenoon, when, assembling together, and being covered with white veils, they bathed in cold water. After thus entering their refectory with certain religious solemnities, they quietly seated themselves, each receiving a loaf of bread and a single plate of one sort of food, and a priest having invoked the divine blessing, they proceeded to take refreshment. When the repast was over, the same priest made an offering of thanks to the great Benefactor of the world, and the brethren all returned to their several employments. These being terminated, in the evening another meal with similar observances was partaken of by all in common.

Next to God, Moses was the object of their reverent homage; and to blaspheme his name was a capital offence. In their reverence for the sabbath they would neither cook their food on that day nor remove a vessel from its place, even for the most pressing wants of nature. At set times they frequented the sacred places called synagogues, where the young sat arranged in classes according to age, under the eye of their elders. Here one took and read, and another expounded, the sacred books. A system of allegorical interpretation prevailed. Among their instructions the virtues of holiness, justice, and economy, held a prominent place;

nor did they omit the duties which men owe to the state. Their teachings were accompanied by definitions and rules, and were enforced by a regard to the love of virtue, the love of man, and the love of God.

According to Josephus, they regarded the body as frail and corruptible, but the soul as living for ever. Asceticism was the necessary result of their conviction that souls came out of the most subtle air, from the loftiest empyræum, and are lodged in bodies as in prisons, from which, when once set free, they rejoice and soar away to their native regions. Of the predictions which Josephus alleges the Essenes to have made, from the study of the sacred writings, and the frequent use of purifications, it would have been wonderful if some had not proved true; for the accomplishment of others, they had the machinery in their own hands.

Their pursuits, trades, and professions were such as conduce to human good. They tilled the ground; they made useful articles; they bred and pastured cattle; but in the fabrication of arms they took no part. Even peaceful pursuits which ministered to vice they carefully avoided. It must not be concealed, however, that some of their notions bordered on extravagance, and that some of their practices betrayed a fastidiousness which bordered on the ridiculous. In morals they seem to have attained no ordinary excellence. Over anger they kept a guard like just stewards. All the passions they knew how to restrain. They were eminent for fidelity, and ministers of peace. Their word was more to be trusted than some men's oaths. Swearing, indeed, they studiously avoided; alleging with no small reason, that the man is already condemned who cannot be believed without an oath.

Admission into their communities was obtained only after a noviciate of twelve months, when those who were approved were habited in white, and received a girdle and a sort of small hatchet, being made "partakers of the waters of purification"—that is, probably, baptized. A further probation of two years was then undergone. When admitted into the society, the neophyte bound himself by vows or oaths to exercise piety towards God and justice towards men; to hate the bad and assist the good; to harm no one, either of his own accord or by the command of others; to be faithful to all men, especially to such as are in authority; to love truth and reprove the liar; to keep his hands clean from theft, and his soul pure from unlawful gain; to conceal nothing from the brotherhood, and reveal to others none of their secrets, not even should life thereby be put in peril; to transmit the Essene doctrines unchanged to others; to preserve their books and the names of their officers (ἄγγελοι, angels) in strict secrecy. The newly-admitted brethren were distributed among four classes; and the gradations of age were so rigidly observed, that if a senior touched a junior brother, the first had to undergo a purification by water, as if he had been in contact with a foreigner. The Essenes did not offer oblations in the Temple at Jerusalem, though they sometimes sent presents thither A pure heart they held to be the best offering. Religious ablutions they considered acts of holiness. They did not admit logic among their studies, and metaphysics they avoided, as relating to subjects which are too high for man; yet they made an exception in favour of those branches which refer to the existence of God and the creation of the world. Morality —the morality which they by their own process learnt from Moses—was the chief object of their studious care.

Pain they disregarded; the miseries of life they held of small account; and they even preferred death to living always. The calm and unmoved firmness with which they endured at the hands of the Romans, during "the Jewish war," the cruellest tortures, and death itself, rather than be faithless to their convictions or forswear their order, serves to show that the ascetic spirit and the martyr spirit have no little in common, and exhibits within the limits of Palestine the very same results, from the very same discipline, as Sparta was proud to call her own.

Josephus mentions another kind of Essenes, who entertained less unfavourable opinions of female virtue and honour, and who, holding that marriage was a divine ordinance for the propagation of the human species, did not think themselves justified in condemning or avoiding it. They, however, used the precaution of giving those females whom they thought of marrying a trial for three years, at the expiration of which they actually married them, provided they were satisfied, merely as a duty, and accordingly did not neglect the same ascetic principles which characterize the whole of the Essene life.

In the account which has now been given we have followed in the main the authority of Josephus and Philo. The latter speaks of a species of Essenes under the name of Therapeutæ, whom we shall notice under that head, contenting ourselves at present with remarking that, in regard to the institutions and practices of the Essenes generally, it is probable that a good deal of the warm colouring of the picture, if not some of its objects, may have been borrowed from the imagination of the artists by whom it was originally drawn. Besides Josephus and Philo, the reader may consult Stäudlin, *Sittenlehre Jesu*, Gotting. 1799; De Wette, *Sittenlehre*, Berlin, 1833; De Wette, *Archäologie*, Leipzig, 1830.

ESSENTIAL, necessary to the constitution or existence of a thing. Thus the primary qualities of bodies, such as extension, figure, number, and so on, are essential or inseparable from them in all their changes and alterations.

ESSENTIAL OILS, or VOLATILE OILS, are mostly obtained from odoriferous vegetable substances, although some of the principles are found in animal matters. They are usually obtained by distillation, but in some instances by simple expression. They differ much in their physical properties. The greater number are yellow, others are colourless, while some again are red, brown, or green, and some few are bluish. Instead of being greasy to the touch, like fat oils, on evaporation they leave the skin dry and hard. Among the principal of the essential or volatile oils, are those of turpentine, aniseed, lavender, nutmeg, cloves, caraway, peppermint, spearmint, sassafras, camomile, and citron. See OILS.

ESSEQUIBO, the principal river of British Guiana, South America. This is also the name of a county through which the river flows. See GUIANA.

ESSEX, a county of England, is bounded on the south by the river Thames, on the east by the German Ocean, on the north by the counties of Suffolk and Cambridge, and on the west by Hertfordshire and Middlesex. Its surface contains 1657 square miles, or 1,060,549 acres. The population has not increased in this county at the same rapid rate as that of some other counties of England.

In 1851 the inhabitants numbered 369,318, being an increase of 62 per cent. in fifty years. The number of inhabitants to a square mile was 222; to a house, 5. The total number of houses was 77,470; 73,530 being inhabited, 3569 uninhabited, and 381 building.

Essex may be considered as a mere agricultural county; for though, from the near approach of one part of it to the metropolis of the kingdom, there are some manufactories established, which find both their raw materials and their consumption in London; and though in one district of the county there are remains of the once extensive manufactories which were brought from Flanders to this island; the number of persons occupied in them bears but a very small proportion to that part of the population which depends on agriculture. The former manufactures of Colchester baizes for the Spanish and American markets have wholly disappeared, and those for woollen goods at Bocking, Halsted, and Coggeshall, are nearly extinct; all having removed to the northern parts of the kingdom. Crapes are manufac-

tured at Braintree, Bocking, and other places; silk, principally for umbrellas, at Colchester and Coggeshall, and satin velvet at Halstead. 2227 hands were employed in the silk trade in 1847. On the eastern side of the county, in the vicinity of the metropolis, are several large distilleries, and some establishments for bleaching and printing calicoes. There are also manufactories of sal-ammoniac, of Prussian blue, of iron liquor for calico-printers, and some other chemical preparations. There is a considerable trade in corn, and much barley is malted for the great breweries and distilleries. The only other commerce is that of supplying the inhabitants with foreign and domestic articles of luxury.

Although nearly half the county is bounded by the sea, or by navigable rivers, it carries on no foreign commerce; and such vessels as belong to it are employed either in conveying to London the produce of its agriculture, or in the oyster fishery, which occupies a considerable tonnage and many seafaring persons. The oysters are bred both in the river Coln and in the Crouch: in the former they are protected by the seignorial rights of the corporation of Colchester, and in the latter by the proprietor of that river, Sir Henry Mildmay. The spawn is deposited in the months of April and May; and it is said the shell about it begins to form within twenty-four hours. The fishermen are forbidden to dredge for them at this season. In the month of July the dredgers separate the small oysters from the stones on which the spawn was deposited, and on which they have grown, and lay them down in the channels of the river till they grow of a size fit for consumption, which is determined by a gage kept for that purpose by the water-bailiff of Colchester. The stones or other substances to which the young oysters had adhered are again thrown into the water whence they were taken, as it is apprehended the accumulation of the ouse at the bottom of the river would otherwise generate such an increase of mussels and cockles as would destroy the breed of oysters. The oyster trade employs about 200 boats and 500 hands. About 15,000 bushels are annually taken. The larger description of vessels are employed during part of the year on the shores of Hampshire and Dorsetshire in dredging for the native oysters, which are afterwards deposited in the beds of Essex and Kent, in order to fatten for the London market. The uncertain produce of the breeding grounds in Essex makes it necessary to have recourse to the more distant coasts to obtain the requisite supply.

From being almost wholly an agricultural county, the far greater part of the inhabitants of Essex are found in villages.

The face of the county is generally very beautiful; it is well inclosed, and for the most part displays good verdant pastures; the hills, none of which rise to great heights, are cultivated to the tops; and there is abundance of trees, especially oak and chestnut, which give a rich appearance to the view. There is no county in England in which the proportion of waste land is so small. The forests and wastes can indeed scarcely be considered as utterly uncultivated, and the whole of them do not amount to more than 14,000 acres, including the two forests of Epping and Hainault. These belong to the crown, though the inhabitants of many surrounding parishes have the right of pasturing their cattle upon them. The sovereign has an unlimited right to keep deer on all the inclosed woods; and the occupiers of land in the various parishes included within the ancient boundaries of the forests have a right to feed horses and cows, but not other cattle. The numerous common rights have led to considerable devastation of the timber of these forests, and occasioned no small injury to the property of the crown; but plans have been adopted for preserving the trees, and converting a part into a nursery for growing timber for the royal navy. Their vicinity to the sea makes these forests well deserving of being appropriated to this purpose.

That part of Essex which lies on the banks of the Thames, and on the shores of the ocean, is a rich alluvial soil on a subsoil of very tenacious clay. It produces, with good cultivation, very abundant crops of wheat, beans, oats, and clover. It is found necessary to the cultivation to fallow very frequently, and repeated ploughings are very generally adopted. The swing plough is much used, and sometimes a wheel plough drawn by two, and occasionally by three horses abreast, which are guided with long reins by the ploughman. In fallowing it is common to plough the land six or seven times, and it is not unusual with the best cultivators to plough it eight or even ten times. After the summer fallow, by which the soil becomes completely pulverized, and rendered as fine as a garden, it is sometimes the practice to sow wheat in the autumn; but it is more common to let it remain throughout the winter, and then, after a spring ploughing, to sow barley or oats. The rotation of crops which usually succeed to a fallow is, 1. barley or oats; 2. clover, red or white, mostly the former; 3. wheat; 4. beans, twice hoed at least; 5. wheat. After this course the land is again fallowed. The whole produce of the course of crops is said to depend on the accuracy and skill exercised in the process of fallowing.

There is in this district some land adapted for turnips, and the rotation on such soils is usually, 1. turnips; 2. oats or barley; 3. clover; 4. wheat; 5. beans; 6. wheat. These courses are occasionally varied, tares being introduced when the clover fails, and peas being sometimes substituted for beans. The best cultivators often omit the second crop of wheat, and fallow again after the beans. A rotation which is sanctioned by some very skilful agriculturists is the following:—1. fallow; 2. barley or oats; 3. clover; 4. beans; 5. wheat; 6. tares or peas; 7. wheat. In this case the manure is laid on the clover ley for the bean crop. In the district we are describing all the farms have a portion, more or less extensive, of rich marsh land, on which oxen are fed, and which supplies hay for winter consumption, and is consequently the source whence the manure is derived. The best wheat that is brought to the market of the metropolis is raised in the part of Essex of which we are speaking, and which is usually denominated the *hundreds*. It has the convenience of water-carriage to London; the rent of the land, which is of extraordinary fertility, is comparatively low; but the want of good water is sometimes severely felt. Much has of late been done to improve the internal condition of the county, but its unhealthiness, from the prevalence of ague, especially in autumn, and the badness of the roads, still continue to prevent many of the gentry from residing on their estates.

The middle part of Essex rises above the level of the marshy lands, but partakes in a considerable degree of their unhealthiness. Around the town of Colchester, for a considerable distance, the soil is a dry loam, well calculated for turnips; and then the most general system adopted is the four-course husbandry of Norfolk, viz., turnip, barley, clover, and wheat. A variation is in some instances introduced by taking a crop of peas after the wheat, and occasionally tares are sown after the barley instead of clover, as that latter plant will sometimes fail if too frequently repeated. The greater part of the district is, however, of a clayey loam, on a subsoil of clay, and too tenacious for the turnip system. Much of this is good old pasture land, used solely for feeding, and to which the plough is never applied. The arable land is highly productive; the crops of wheat and beans especially are very luxuriant, and their produce of the best quality. The practice of fallowing is pursued as in the district before described, but so many ploughings are not deemed necessary. The rotation is various, but it rarely occurs that wheat is sown immediately after the fallow. Most commonly the succession is as follows:—1. fallow; 2. barley; 3. beans; 4. wheat; 5. tares; 6. barley; 7. clover. When the land is more wet, which, in spite of excellent draining, is frequently the case, the rotation is, 1. fallow; 2.

oats; 3. clover; 4. wheat. When manure is abundant, the heavy soils are cropped in the following rotation with great success: 1. fallow; 2 beans; 3. wheat; 4. tares; 5. barley; 6. clover; 7. beans; 8. wheat. In this rotation the clearing of the ground from weeds depends on the use of the hoe, which is applied most carefully to the crops of beans.

The western part of the county, especially where it borders on Hertfordshire, is, in general, land of a very inferior quality, and, without very expensive cultivation, yields but light crops. In one extensive district, called the Rodings, is still practised a most singular system of husbandry, known now in Essex only, though formerly it was adopted on poor lands in some other counties. It is, 1. a year's fallow; 2. wheat; 3. fallow; 4. barley, and then a repetition of the same course; thus having one-half the arable land constantly without any crop. The soil is a tenacious clay, of a reddish colour, upon a subsoil of white clay. It is difficult to pulverize, and, with wet, potches so much as not to admit of ploughing when the atmosphere is moist. There are but small parts of this district which produce clover, peas, tares, or beans; and hay is only grown on the narrow borders of the rivulets which run in the valleys.

In the south-western part of the county the agriculture assumes that system which is adapted to the supply of the wants of the metropolis. A great portion of the land is in permanent pasture, or grows hay to furnish the markets of Smithfield and Whitechapel. The arable land is generally cultivated with a rotation of three crops, viz., potatoes, wheat, and clover; and as London supplies abundance of manure, by applying it very liberally to the young clover after the wheat is harvested, most abundant crops are the consequence, and the land is cleaned by the potato culture. In this kind of husbandry, which, indeed, can only be conducted where manure is to be obtained with great facility, the plough is only used once in the rotation after the clover; for as the potatoes are planted, the digging them up sufficiently prepares the land for wheat.

The farms vary much in size, but average from 150 to 200 acres. They are sometimes held on lease for seven or fourteen years, but more generally from year to year. Wheat averages 20 to 30 bushels to the acre; barley 40, oats 12 quarters, beans 32 bushels, and potatoes 300 bushels. Teasel, caraway, and coriander, are grown together in spring. The coriander is cropped in autumn, the caraway in July of the succeeding year, and the teasels in September of the same year. Hops, saffron, and mustard, are also grown in a few localities.

Essex feeds some sheep, but very few are bred in the county. The stock of sheep, principally Southdowns, is about 520,000, producing annually 8650 packs of wool. Calves are suckled to a great extent, and the rearing of them to furnish veal for the London market is the principal source of income to many farmers. The whiteness of the veal is produced by a great attention to cleanliness, by regular periods of suckling, and by giving the calves a small portion of barley-meal mixed with chalk. The tendency to fatten is promoted by administering narcotic drugs, which keep the young animals in a quiescent state. Though the county affords such abundance of excellent pasture, yet the fattening of calves is so much more profitable than the dairy, that it is supplied with butter from other counties. Epping has indeed been celebrated for its excellent butter; but the greater part of what is sold in London under that denomination is the produce of Northamptonshire, Buckinghamshire, and other counties. The Epping dairies produce 212 pounds of butter per cow annually. London is supplied with much of its beef from Essex. The bullocks, in a lean state, are brought from Scotland, from Wales, and some from Devonshire, and are fattened in this county, sometimes on the rich natural meadows, and sometimes on turnips with the addition of oil-cake.

The landed property in Essex, as in other counties near the metropolis, is very much divided; there are no overgrown estates, though some of considerable value, belonging to a few individuals; but the greater part is in moderate-sized farms, which can be easily disposed of, and which are frequently purchased from the savings of the commercial class in London.

The only good harbour in this county is Harwich, whence the packets for Holland are despatched, and where there is a royal dock-yard, in which some frigates are built and repaired. The river Coln is navigable for small vessels to Colchester, and the Blackwater river to Walden. The Crouch is navigable for the largest ships; but, passing through an unhealthy country, and having few inhabitants on its borders, it is useless for the purposes of commerce. The river Lea is navigable by barges a distance of 25 miles. There are no canals in this county, but one is projected to unite the river Lea with the Cam, and thus create internal navigation from Lynn to London.

The county is divided into two almost equal portions by the London and Eastern Counties Railway, from which are a few branches. The London and Cambridge line skirts the western boundary.

The county gives the titles Earl of Essex to the Cassel family, and Lord Colchester to the Abbots.

The members of the House of Commons elected in Essex are ten, being two for each of the boroughs of Colchester, Harwich, and Maldon, and four for the county, which, for election purposes, has been divided into the northern and southern districts. The polling places of the former are Braintree, Colchester, Saffron-Walden, and Thorpe; and of the latter, Chelmsford, Billericay, Romford, Epping, Rochford, and Maldon.

The most remarkable seats of noblemen and others are Audley-End, Lord Braybrooke; Thorndon, Lord Petre; Easton Lodge, Lord Maynard; Navestock, Earl Waldegrave; Mistley Hall, Lord Rivers; Dagenham Park, Sir Thomas Neave; the Hyde, —— Disney, Esq.; Hill Hall, Sir E. Smith, Bart.; Weald Hall, Christopher Tower, Esq.; Boreham House, Sir John Tyrell, Bart., M.P.; Coped Hall, —— Conyers, Esq.; Mark Hall, —— Honeywood, Esq.

The antiquities of the county consist of British camps at six distant places, including Ruckolt, Bartlow Hills, and Lexden Heath; Roman camps at Witham, Colchester, and other places, and a number of Saxon remains. Some remains of castles are still extant, among which the most interesting, at least historically, is Pleshy, once the seat of the "Good Duke Humphrey."

Hainault Forest was once famous as the hunting ground of Queen Elizabeth, who by her noted speech at Tilbury rendered that fort famous in history; and Colchester for its stout defence when besieged by Fairfax in 1648. Tusser the agricultural poet, Ray the naturalist, Bishop Bedell, and Quarles the poet, were natives of the county.

Essex, the name of several towns in the United States, the principal of which is in the state of New York, on the W. side of lake Champlain, 108 miles N. by E. of Albany. Pop. (1850) 2351. There are also several counties in the United States of this name.

ESSLING, a village of Austria. See Aspern.

ESSLINGEN, a town of Würtemberg, circle of Neckar, on a river of that name, 7 miles N.E. of Stuttgart. Pop. about 7000. The town is very ancient, and previous to 1803 was one of the free cities of the German empire. It is surrounded by walls, and has five suburbs, one of which stands on an island in the river. On a commanding height above the town stands an old castle. The church of Our Lady is a Gothic edifice built in 1440, and has a tower 230 feet high. The town-hall is a handsome building. Esslingen has a richly endowed hospital, an orphan asylum, and a normal and other schools. The manufactures include

woollen and cotton stuffs, and hardware. In the vicinity are numerous vineyards producing a sparkling wine known as Neckar champagne.

ESTAFETTE, a military courier.

ESTATE, in *Law*, signifies the title or interest which a person has in lands, tenements, or other effects. Estates are *real* or *personal*. *Real* estate, called also *heritable* estate, consists generally in things immoveable, as lands, houses, &c., or in rights secured on these. *Personal* or *moveable* estate consists generally in things moveable, as money, household-furniture, ships, &c.

ESTATES, in a political sense, a term used to denote either the dominions of a prince, or the several classes of men in a society or government.

In Great Britain the estates of the realm are the sovereign, lords, and commons; or rather the lords and commons, who meet the sovereign in parliament, for the purpose of reforming abuses and enacting laws.

ESTE, the ancient *Ateste*, a town of Lombardy, delegation of Padua, 18 miles S.S.W. of the town of that name. It is picturesquely situated at the foot of the Euganean hills, on the canal of Monselice. Most of the houses are supported by arches. The exterior of the church of San Martino bears the appearance of high Romanesque antiquity, but the interior is modernized. There is a leaning tower in the same Romanesque style. The Rocca or castle near the town is a fine and almost perfect building, standing on the site of the original fortress, the seat of the celebrated family of Este. The more immediate founder of this family was Alberto Azzo, born in 996, from whom the sovereigns of Great Britain, Hanover, Brunswick, and Modena are descended. Pop. about 9000, employed in manufactures of silk twist, hats, linens, and earthenware.

ESTELLA, a town of Spain, province of Navarre, on the Ega, 25 miles S.W. of Pamplona. It has an old castle, a college, several brandy distilleries, and manufactories of woollen cloths. Pop. 5342. It was long the headquarters of Don Carlos, who was proclaimed king here in 1833.

ESTEPONA, a maritime town of Spain, in the province of Granada, on the Mediterranean, 25 miles E.N.E. of Gibraltar. It carries on an active fishing and coasting trade. The manufactures are chiefly linen, leather, earthenware and bricks. The vicinity is very fertile, producing oranges, lemons, and other fruits, which are largely exported to England. Pop. 9383.

ESTERHAZY or ESTERHAZ, a village of Lower Hungary, county of Oldenburg, near the S.E. extremity of Lake Neusiedl, 40 miles W.S.W. of Presburg. Here, surrounded by gardens and a noble park, stands a magnificent palace of Prince Esterhazy, now unoccupied. It is in the florid Italian style, and is surrounded by a gallery adorned with statues and vases. Its marble halls brilliant with gold and painting are still fresh as when new.

ESTHER, BOOK OF, one of the eleven books styled *Ketubim*, and of the five *Megilloth*. It is called by the Jews *Megillah Esther*, and sometimes simply *Megillah*, as it forms by itself a distinct roll. In the Christian Church it has been also called *Ahasuerus*, which name it bears in some copies and printed editions of the Vulgate. In the Hebrew it is placed with the other *Megilloth*, after the Pentateuch, between the Books of Joshua and Ecclesiastes, and sometimes among the *Hagiographa*, between Ecclesiastes and Daniel. In the Vulgate, Tobit and Judith are placed between Nehemiah and Esther. Luther placed it immediately after Nehemiah to prevent the books of Nehemiah and Ezra from being disunited. It has continued to retain this position in the Reformed versions.

The principal historical difficulty of this book has been the solution of the question—What king of Persia is meant by Ahasuerus? For there has been no Persian monarch from Astyages, who died B.C. 603, and his son Cyaxares, to Darius Ochus, who died B.C. 358, or his son who died 20 years later, who has not been maintained to be the husband of Esther. Those who have most suffrages are Darius Hystaspis, Xerxes, and Artaxerxes Longimanus; for which last monarch we have the authority of Josephus and of the Septuagint Version, wherein he is called by the name of Artaxerxes. Jahn coincides with the view of Scaliger, who supposes that Amestris, the cruel and vindictive wife of Xerxes, is no other than Esther, as both the name and the character of Amestris favour the supposition that she is the Esther of the Bible. But she is said by Herodotus to have been the daughter of Otanes, a *Persian*, and to have been married to Xerxes before his Grecian expedition. Bellarmine, who adopts the view of Josephus, is not affected by the circumstance that, in this case, Mordecai's age must have exceeded 165 years, as he himself had known "a hale old man of 105, who was likely to live still many years." Of the true historical character of the book the existence of the feast of Darius furnishes a sufficient attestation. Of the authorship of Esther nothing is known, nor have we any data on which to form a reasonable conjecture. Augustine ascribes the book to Ezra. Eusebius ascribes it to some later but unknown author. Clemens Alexandrinus assigns it, and the Book of Maccabees, to Mordecai. The pseudo-Philo and Rabbi Azarias maintain that it was written at the desire of Mordecai by Jehoiakim, son of Joshua, who was high priest in the 12th year of the reign of Artaxerxes. De Wette assigns it to the age of the Ptolemies and Seleucidæ, whose era commenced B.C. 312; while Jahn maintains that it must have been written soon after the facts which it records, and before the destruction of the Persian monarchy (B.C. 330), to whose annals it appeals.

Various attempts have been made to assign to the Book of Esther only a deutero-canonical character, partly from its being unquoted in the New Testament, and partly from its being omitted in the catalogues of Melito and other writers. The former objection, however, would hold true of many other books which are yet of undoubted authority; and the latter is met to a large extent by the consideration that the Book of Esther is included under the books of Ezra. Against this slender evidence there is a large mass of positive authority which it is needless to adduce at any length. The hostility of Luther to this part of the Old Testament on account of its Judaism and "heathenish naughtiness," is considerably palliated, if, as seems probable, he referred to the whole book with its apocryphal additions. These he removed to a separate place among the apocrypha; and though they have been placed authoritatively in the canon by the council of Trent, it is certain that they were as ignominiously treated by the fathers as by Luther.

ESTHETICS. See ÆSTHETICS.

ESTHONIA or ESTLAND, one of the Baltic provinces of Russia, lying between N. Lat. 58. 20. and 59. 30., and between E. Long. 23. 20. and 28. 20. It is bounded on the N. by the Gulf of Finland, W. by the Baltic, S. by Livonia and Lake Peipus, and E. by the province of St Petersburg. It comprises the islands of Dago, Worms, &c., and a portion of Lake Peipus; and has a total area of 7966 square miles. Estimated population (1846) 310,400. The surface is generally flat, occasionally diversified with undulating hills. The soil is mostly sandy, and a great part of it is occupied by swamps and morasses. It has numerous streams, but the only river of importance is the Narva, which flows northward from Lake Peipus to the Baltic, and forms the boundary between this province and that of St Petersburg. The climate is cold and moist. The winters are long, extending from the end of October to May, and fogs and violent winds are common throughout the year. Not above one-third of the province is under cultivation; but the chief occupation of the inhabitants being agriculture, the corn produced is more than sufficient for home con-

sumption, the surplus being used for making spirits. Besides rye, barley, and oats, it produces wheat, maize, hemp, flax, hops, and tobacco. Several species of pulse are extensively cultivated, and form a large proportion of the nourishment of the peasantry. The forests are extensive, and include fir, pine, elm, birch, larch, beech, oak, &c. The province possesses large meadows and good grazing grounds: next to agriculture the rearing of cattle engrosses the chief attention of the inhabitants. The horses and horned cattle are small. Sheep, goats, swine, and poultry, are reared in great numbers. Of the wild animals, the bear, wolf, fox, badger, and lynx, are the most common; some elks are also found. The fisheries along the coast are very productive. The manufactures are few and unimportant, being mostly domestic. There are numerous distilleries, and the inhabitants, according to ancient usage, enjoy the right of working them without government license. The chief town is Revel. This country was sold by the Danes to the Teutonic knights in 1346, and became a province of Sweden in 1560. In 1710 it was wrested from the Swedes by Peter the Great.

ESTOILEE, or Cross Estoilée, in *Heraldry*, a star with only four long rays in the form of a cross, broad in the centre, and terminating in sharp points.

ESTOPPEL (Fr. *estouper*, to stop), in *Law*, an impediment or bar of action, arising from a man's own act or deed.

ESTREMADURA, a province of Spain, lying between N. Lat. 37. 58. and 40. 32., and between W. Long. 4. 32. and 7. 26., being about 180 miles in length from N. to S., by 130 in extreme breadth, and having an area of about 14,280 square miles. It is bounded on the N. by Salamanca and Avila, E. by Toledo and La Mancha, S. by Cordova and Sevilla, and on the W. by Portugal. The name is said to be derived from the Latin *extrema ora*, as it was the extreme conquest of Alonso XI. from the Moors in 1228. The Tagus and the Guadiana cross this province from E. to W., and their respective basins form two natural and nearly equal divisions; that of the Tagus, being the northern, called Alta or Upper Estremadura, and that of the Guadiana, Baja or Lower Estremadura. These two basins are separated from each other by a range of mountains, of which the eastern and highest portion attains an elevation of from 5000 to 6000 feet above the level of the sea. This natural division corresponds to the division into the new provinces of Badajoz and Caceres, the former being Baja Estremadura, and the latter Alta Estremadura. These contained in 1849 respectively 336,136 and 264,988 inhabitants. The basin of the Guadiana is bounded on the S. by a continuation of the Sierra Morena, which fills up the southern part of the province with hilly ground, and divides the waters of the Guadiana from those of the Guadalquivir. A branch of this chain proceeds northward from the confines of Cordova to the Guadiana. The basin of the Tagus is bounded on the N. by a range of mountains which proceed westward from Avila along the boundaries between Estremadura and Salamanca, and afterwards enter Portugal. From this northern range a branch proceeds in a S.W. direction, between the rivers Alagon and Tietar: from the eastern part of the central range a branch proceeds in a N.W. direction to the Tagus. The climate in summer is hot, but not unwholesome, except in some swampy places along the Guadiana. There is then but little rain; dew, however, is abundant and sufficient to moisten the ground; and the nights are cool. Although the high mountains are covered with snow in the end of November, the winters are not severe. The soil is very fertile, and might be rendered highly productive by a proper use of the waters of the many rivers by which it is intersected. Agriculture, however, is wholly neglected, and the noble plains that might yield abundance of all sorts of products are devoted only to pasturage. Vast numbers of Merino sheep come annually from other parts to winter in these plains. Immense herds of swine are reared in this province and constitute a great source of support to the inhabitants, not only supplying them with food, but also forming a great article of export to other provinces,—the pork, bacon, and hams of these being in high esteem. The extensive forests of oak, beech, and chestnuts afford an abundance of food for hogs. Olive, fruit, and cork trees are numerous. Game is abundant, and fish swarm in the rivers and streams. Estremadura has mines of lead, copper, silver, and iron, but these are almost totally neglected; and the manufactures are few. The chief products are corn, wine, oil, hemp, and flax.

Estremadura, a province of Portugal, bounded on the N. and N.E. by Beira, S. and S.E. by Alemtejo, and W. by the Atlantic Ocean. It lies between 38. 6. and 40. 15. N. Lat., and between 7. 43. and 9. 32. W. Long., being about 140 miles in length from N. to S., by about 80 miles in breadth. The river Tagus divides it into two nearly equal parts, the northern being the more mountainous, but at the same time the more fertile of the two. A chain of mountains extending from Beira traverses the northern portion from N.N.E. to S.S.W., and terminates on the coast between the estuary of the Tagus and the sea. This range sends off spurs in various directions. Between Torres Vedras and Lisbon is an extensive chain of points, some formed by nature and others by art, and stretching in a general direction from E. to W. Along these Lord Wellington constructed a series of defensive works called the "Lines of Torres Vedras," by means of which he was able successfully to resist the advance of the French invaders. This mountain chain attains a height of 2300 feet, and separates the streams which fall into the Tagus from those that flow directly into the sea. The part lying N.W. and between it and the sea is mostly flat and sandy towards the coast, and either barren or covered with forests of pines. For about 50 miles N. of the mouth of the Tagus, however, or as far as Peniche, the coast consists of rocky cliffs, some of which attain a great elevation. S.E. of the ridge, and sloping towards the Tagus, the country is finer and better cultivated. The plains about Tomar and Santarem are very fertile, and abound with olive and other fruit trees. But the finest part of the province is that which lies S. of the lines of Torres Vedras towards Lisbon. Here the valleys are covered with villages, country seats, gardens, orchards, and vineyards. S. of the Tagus the country is mostly low and flat, and in several places unhealthy. The land rises towards Alemtejo, and several ranges of hills proceeding from that province enter Estremadura. The principal river is the Tagus, which falls into the sea below Lisbon. The Zezere is a large and rapid stream which rises in Beira, and flowing southward falls into the Tagus below Punhete. The Zatas and Almansor both rise in Alemtejo and flow at a short distance from each other into the eastern of the two branches into which the Tagus is divided above Lisbon. The principal of the rivers flowing directly to the sea are in the northern portion, the Lis, Alcoa, Arnoya, and Zizambre; and in the southern the Maroteca and the Sado, the last being the largest. Estremadura is divided into three districts as follows:

Districts.	Area in Square Miles.	Pop. in 1851.
Leiria	1310	140,114
Santarem	2310	161,342
Lisbon	3604	423,705
Total	7224	725,161

ESTREMOZ, a strongly fortified town of Portugal, province of Alemtejo, 24 miles N.E. of Evora. It is the seat of the provincial authorities, and has several churches and convents, an hospital, arsenal, cavalry barracks, and manufactures of earthen and hard wares. The castle stands on a commanding eminence. Pop. about 6000.

ESTRICH, in *Commerce*, the fine soft down which lies

immediately below the feathers of the ostrich. It is used as a substitute for beaver in hat-making, and the coarser kind is employed in the fabrication of a stuff resembling woollen cloth. It is sometimes written *estridge*.

ESTUARY. See ÆSTUARY.

ETAMPES (formerly ESTAMPES), a town of France, capital of a cognominal arrondissement in the department of Seine-et-Oise, on the Paris and Orleans railway, 30 miles S. by W. of Paris. It is situated in a fertile valley on the banks of two small streams which fall into the Juine immediately below the town. Etampes is tolerably well built, and is the seat of a tribunal of primary instance, a communal college, and an agricultural society. The church of Notre-Dame is a Gothic building of the thirteenth century, having a lofty tower and spire. The church of St Martin is a very fine edifice. The tower called *Guinette* is all that now remains of the ancient royal castle, built in the eleventh century by King Robert. Etampes has manufactures of soap, leather, and woollen goods, and a large trade in corn. In the town and vicinity are numerous flour-mills for the supply of Paris. Pop. (1851) 8083.

ETAWEH, a town and fortress of Hindustan, and the principal place of the British district of the same name. It is situated on the eastern bank of the Jumna, many parts of which, during the dry season, are 60 feet in height. The town is built on the heights, and, as it approaches the river, is divided into separate hills by deep ravines. In a commercial point of view the town enjoys great advantages, being situated at the junction of the road from Calpee to Agra with that from Cawnpore to the same place. A mile N.W. of the town is the European cantonment. Exclusive of the military, the population of Etaweh, by the census taken on January 1, 1853, is returned at 23,000 persons. Distant N.W. from Calcutta 710 miles. The district of which this town is the capital was divided from that of Cawnpore in 1840, and formed into a separate jurisdiction. It is almost wholly situate in the Doab between the Ganges and the Jumna, a small strip only being separated from the remainder by the latter river, and lying along its right or south-western bank. The population in 1853 was ascertained by official return to amount to 610,965. Of this number 401,367 are stated to be Hindus engaged in agriculture, 176,791 Hindus engaged in other pursuits, 9327 Mohammedans and others not Hindus, agricultural, and 23,480 of those classes non-agricultural. Hence it is seen that the Hindus constitute an overwhelming majority of the population. The right of the British government to this tract dates from 1801, when it was ceded by the Vizier of Oude, forming a portion of the possessions alienated by that prince in commutation of subsidy. The town of Etaweh is in Lat. 26. 46., Long. 79. 4. (E. T.)

ETCHING, a method of engraving on copper, in which the lines or strokes, instead of being cut with a tool or graver, are eaten in with aquafortis. See ENGRAVING.

ETELENT, a town of the Arabian Irak, on the river Tigris, 66 miles N.N.W. of Bassora.

ETEOCLES, a son of Œdipus and Jocasta. After his father's death he agreed to share the royalty alternately with his brother Polynices, but at the expiry of the first year he refused to surrender the throne. Polynices, summoning Adrastus, king of Argos, to his aid, headed the famous expedition of the Seven against Thebes. After a series of unavailing skirmishes, it was at last agreed between the two brothers that the war should be decided by single combat. An encounter ensued, and both combatants fell; and so fierce was their resentment, that according to tradition their ashes refused to mingle on the funeral pile.

ETERNITY, duration without beginning or end; duration without end. Among the Romans, *Æternitas* was used as one of the titles of the emperor, like *divinitas*, *majestas*, &c.; and, in the same spirit, Rome itself was designated the *Eternal City*. Æternitas was regarded as a divinity, without temples or altars; and was represented as a woman holding the sun in one hand, and the moon in the other. Her symbols were a phœnix, a globe, and an elephant.

ETESIAN WINDS (*Etesiæ*, from ἔτος, *year*) are such as blow at stated times of the year. Such are the monsoons and trade-winds, which in some parts of the world continue to blow in the same direction during stated seasons of the year. The term was applied by the ancient Greek and Roman writers to the periodical winds in the Mediterranean, from whatever quarter they blew.

ETHER, an element more pure and subtile than air; the matter of the highest region above. This fluid has been considered by the ancient, and many modern philosophers, to be diffused throughout the universe. With reference to the motions of the celestial bodies, it has been termed the *ethereal medium*. Newton believed in the existence of such a fluid.

ETHER, in *Chemistry*, an extremely volatile and inflammable fluid, produced by the distillation of alcohol with an acid. According to the acid employed in its preparation, it receives the names of nitric ether, sulphuric ether, &c.; but when perfectly rectified, the ether is the same whatever acid has been used. See CHEMISTRY.

ETHERIDGE, or ETHEREGE, SIR GEORGE, a wit and comic writer in the reigns of Charles II. and James II., was descended from an ancient family in Oxfordshire, and born in 1636. His youth was spent in travelling, and also partly in the study of the law. His first dramatic performance, entitled *Comical Revenge, or Love in a Tub*, appeared in 1664, and introduced him to the leading wits of the time. In 1668 he produced a comedy called *She Would if She Could;* and in 1676 he published another, entitled *The Man of Mode, or Sir Fopling Flutter*. This latter piece he dedicated to the Duchess of York, who, on the accession of James II., procured his appointment as ambassador, first to Hamburg and afterwards to Ratisbon. His knighthood was purchased to gratify the ambition of a rich widow, to whom he paid his addresses for the sake of recruiting his fortune. The precise date of his death is unknown, but it is generally agreed that he did not long survive the Revolution. The works of Etheridge are characterized by considerable vivacity and wit; qualities, however, which only render their licentiousness more dangerous. From the simplicity and pliancy of his disposition, he became known under the familiar appellations of Gentle George, and Easy Etheridge.

ETHICS (ἦθος, *custom, moral character*), the science that treats of the nature and value of moral distinctions; commonly called moral philosophy. See MORAL PHILOSOPHY.

ETHIOPIA. This term was used by the ancients in two senses. In its widest acceptation Ethiopia comprised the vast and unexplored country lying between the Red Sea and the Atlantic, and along the line of the equator northwards to the inhabited countries bordering on the Mediterranean. In a more restricted sense it was applied to the kingdom of Meroë, which, in contradistinction to the other, was called the civilized Ethiopia. An account of this country, as far as it has been explored, will be found under the heads AFRICA, ABYSSINIA, MEROE, &c.

ETHIOPS, a name given by the alchemists to several metallic preparations of a black colour. Thus the black oxide of iron was called *ethiops martial;* the black sulphuret of mercury, *ethiops mineral;* and the black oxide of mercury, *ethiops per se*.

ETHNARCHA (ἔθνος, *nation*, ἀρχή, *command*), in *Antiquity*, a governor or ruler of a country. The title of ethnarch, like those of tetrarch and phylarch, appears to have been used by the Romans to designate such tributary princes as were not of sufficient importance to be styled kings. See TETRARCH.

ETHNOLOGY.

ETHNOLOGY is a word of Greek derivation, belonging to the same class, and formed on the same principles, as *Geology*, *Astrology*, *Biology*, *Physiology*, &c. The initial element, *Ethno-*, means, in its primary sense, *nation;* in its secondary, the *Varieties of the Human Species.* These are the true objects of ethnological study. Ethnology has been defined to be the *Science of Races*, but to this definition there is an objection. What is a *race*, if it be neither a *species* nor a *permanent variety?* Then, if it be neither of these, nor yet anything different from them, what is the use of the term? The answer to this has been suggested by Dr Prichard. Suppose an inquirer into the natural history of mankind to be doubtful whether a certain division constitute a *species* or only a *variety*, his argument may take such a form as to preclude him from the use of either term. His judgment is in suspense, and, as a consequence thereof, his phraseology is undefined. In such a case *race* is a useful word, being one which can be used when there are doubts as to whether we are dealing with a separate species or a variety of some species already recognised. Hence the term is *subjective*, *i.e.*, it applies to the opinion of the investigator rather than to the object of his investigation; its power being that of the symbol of an unknown quantity in algebra. Useful, however, as it is, it is more so in the investigation of a doubtful problem than in the exposition of a known series of facts.

Another synonym to the word *Ethnology* is *The Natural History of Man. The Physical History of Man* is another. Both these convey the idea of ethnology, and something more, *i.e.*, of the closely allied science of *anthropology.* Between these the *Natural History of Man* is divided; *anthropology* determining the relations of man to the other members of the animal kingdom, *ethnology* the relations of the different divisions of mankind to each other. There existed the materials for anthropology when the first pair of human beings stood alone on the face of the earth, and there would exist the same materials for anthropology if the world were reduced to its last human family, if it had no inhabitants but Englishmen, or none but Chinese; none but red men of America, or none but blacks of Africa. Were the uniformity of feature, the identity of colour, the equality of stature, the rivalry of mental capacity, ever so great, there would still be an anthropology. This is because anthropology deals with *man as compared with the lower animals.* As anthropologists we consider the structure of the human extremities, and enlarge upon the flatness of the foot and the flexibility of the hand. The one is subservient to the erect posture, the other to the innumerable manipulations which human industry demands. We compare them with the fins of fishes, or the wings of birds; in doing which we take the most extreme contrasts we can find. But we may also take nearer approximations, *e.g.*, the hands of the higher apes. Here we find likeness as well as difference; difference as well as likeness. We investigate both, and record the result either in detail or by some general expression. Perhaps we pronounce that the one side gives the conditions of an arboreal life, the other those of a social state; the ape being the denizen of the woods, the man of towns and cities; the one a climber, the other a walker. Or we compare the skull of the man and the chimpanzee; noticing that the ridges and prominences of the external surface, which in the former are merely rudimentary, become strongly marked crests in the latter. We then remember that the one is the framework for the muscles of the face, the other the case for the brain. All this is anthropology as opposed to ethnology, the latter being a study which has no existence where there is no variety. The more manifold this variety the greater the scope of the ethnologist, and the wider his field. No matter how we classify our varieties. Whether the individuals and groups of individuals which exhibit them form different species of a genus, different genera of an order, or merely different varieties of a species, is indifferent.

The word, like the department of knowledge that it expresses, is new; so new that it may almost be said to be unfixed both in power and in form. Instead of *ethnology* many writers say *ethnography.* Some use the two words indifferently. Others use both, but distinguish between them; the latter meaning the *descriptive*, the former the *speculative*, portion of the subject.

No science has its relations to the other branches of study more accurately defined than ethnology. It is connected with zoology proper through anthropology, anthropology differing from zoology in its greater simplicity in one respect, and its greater complexity in another. So far as it deals with a single order, genus, or species, anthropology is simpler than zoology. So far as the characteristics of this order, genus, or species are peculiar, zoology is simpler than anthropology. The chief criteria of the animals below man are physical rather than moral: of man they are moral rather than physical. Anthropology gives us the *naturalist* view of our species.

Ethnology, on the other hand, gives us the *historic* view of it. Yet ethnology is different from ordinary history. In ordinary history we trace the effects of human actions upon humanity, the influences being moral. In ethnology we investigate the influences of soil, climate, nutrition, and similar agencies, for the most part physical. There is a difference between the two studies in all this. There are further points of difference. The facts with which history proper (civil history) deals are of later date than those of the ethnologist, the arena of the ethnologist being in the earlier period of the world's history, a period for the most part anterior to the existence of written records and the other forms of historic testimony. In this way ethnology is the general archæology of man, to which the special branches of that subject are, more or less, subordinate. The methods of the ethnologist and the civil historian are not less different than the fields in which they work. History collects its facts from testimony; ethnology infers them by means of its own proper induction, arguing backwards, from the known to the unknown, from the effect to the cause. It was not until the publication of one of his latest works that Dr Prichard recognised the inductive character of ethnological research, and the extent to which his science was thereby separated from that of the civil historian. However, in his anniversary address to the Ethnological Society in 1847, he distinctly recognised it. "Geology, as every one knows, is not an account of what nature produces in the present day, but of what it has long ago produced. It is an investigation of the changes which the surface of our planet has undergone in ages long since past. The facts on which the inferences of geology are founded are collected from various parts of natural history. The student of geology inquires into the processes of nature which are at present going on, but this is for the purpose of applying the knowledge so acquired to an investigation of what happened in past times, and of tracing, in the different layers of the earth's crust, displaying, as they do, relics of various forms of organic life—the series of the repeated creations which have taken place. This investigation evidently belongs to history or archæology, rather than to what is termed natural history. By a learned writer, whose name will ever be connected with the annals of the British Association, the term palæontology has been aptly applied to sciences of this department, for which physical archæology may be used as a synonym. Palæontology includes both geology and ethnology; geo-

logy is the archæology of the globe; ethnology that of its human inhabitants." For the important term Palæontology we are indebted to Dr Whewell; for the best illustrations of the palæontological method, to Sir C. Lyell. Each of these writers, though specially engaged upon other subjects, has largely contributed to impress upon English ethnology, at least, a scientific character—having done more than any proper ethnologist towards defining the *method* of ethnological investigations.

A great portion of the subject-matter to which this method applies has already been suggested by the relations of ethnology to anthropology on the one hand, and to civil history on the other. In the former, we give prominence to the phenomena of physical conformation—bodily and mental structure. In the latter, we investigate the phenomena and development of the social state. Subordinate to these studies are the ordinary preliminaries to a naturalist's and to a historian's education. To these, however, ethnology superadds much that is peculiar and proper to itself—just as the study of the varieties of such species as the horse, the domestic fowl, the sheep, or the dog, introduces a multitude of questions that the study of simpler and less varied species dispenses with. Let a naturalist employ himself on say the dog. He will assuredly find that the study of the *variety* far surpasses in complexity that of the species. But what if the dog-tribe had the use of language? What if the language differed with each variety? In such a case the study of canine ethnology would be doubly and trebly complex, though at the same time the data for conducting it would be both increased and improved. A distant, a very distant, approach to this exists. The wild dog howls; the companion of man alone barks. This is a difference of language as far as it goes, which is far enough to foreshadow the importance of the study of language as an instrument of ethnological investigation. Again, what if the dog tribe were possessed of the practice of certain human arts, and if these varied with the variety? What if they buried their dead, and their tombs varied with the variety? if those of one generation lasted for years, decenniums, or centuries? The ethnology would again increase in complexity, and the data would again be increased. The graves of an earlier generation would serve as unwritten records of their habits of sepulture, and these differences in the mode of sepulture would be measures of some difference in the way of ethnology—indicative, perhaps, of some moral peculiarity; or, perhaps, indicative only of certain physical conditions of soil, climate, animal or vegetable products. The nidification of birds is a real example of this kind.

Hence the domain of the ethnologist touches those of the archæologist and the philologue. But by far the most important of the accessories to ethnology is physical geography, studied with a special view to the relations between the bodily conformation of the occupants of a given area, and its climatological and other conditions. That any amount of intertropical influences can convert a white man into a negro is what many deny, and that on reasonable grounds. That any degree of arctic cold can convert a negro into an Eskimo is in like manner doubted. Neither is the possibility of two such extreme forms being developed out of some intermediate one at all freely admitted. In other words, the effects of climate, &c., upon the human frame are by no means held to be indefinite. That climate, &c., however, have *some* influence no one denies, though many limit it to a *minimum*.

So much for the *method*. As to the *results* of ethnological investigation, they are either so many points of classification, or so many points of history. They are so many points of classification, if we suppose that the differences between the different divisions of one kind have always been what they are at present; and they are so many points of history (*physical* history), if, supposing the whole species to have once been the same throughout, we deduce the present distinctions from the influences of climate and other causes acting during a long or short space of time.

It has been stated that the science is a new one; so new as for its method to have been but recently explained, and so new as for its nomenclature to be, even at the present moment, more or less unfixed. The materials, however, for a science are always older than the science itself. Hence, we find in more writers than one (some of considerable antiquity), ethnological notices, and even ethnological trains of reasoning, though no system of ethnology. In *Greek* literature not a little of this sort of information is found in Herodotus, an unconscious and instinctive ethnologist. He has described manners, and he has given glosses from several barbarous forms of speech. In Hippocrates we find an approach to a theory as to the effect of the external physical conditions of climate and the like on the human frame. Something, too, we find in Aristotle, and something in Plato; nothing, however, by which the study of man as an animal is recognised as a separate substantive branch of science. More than this, in works where the description of new populations was especially called for, and where the evidence of the writer would have been of the most unexceptionable kind, we find infinitely less than there ought to be. How little we learn of Persia from the *Cyropædia*, or of Armenia from the *Anabasis;* yet how easily might Xenophon have told us much!

The opportunities of the *Romans* were greater than those of the Greeks, and they were better used. This we see in Sallust's sketch of Northern Africa, and in Cæsar's of Gaul. The nearest approach, however, to a proper ethnological monograph is the *Germania* of Tacitus. It is far, however, from either giving us the facts which are of the most importance, or exhibiting the method of investigation by which ethnology is most especially contrasted with history. But the true measure of the carelessness of the Romans upon these points is to be taken by the same rule which applied to that of the Greeks, *i. e.*, the contrast between their opportunities and their inquiry. How much they might have told us of such vast areas as Asia Minor and Persia—as the Danubian Principalities (Dacia), as Pannonia, Dalmatia, and Rhætia. We *now* ask, with interest and uncertainty, such questions as who were the Getæ? who the Thracians, &c? Some answer *Germans*, some *Slavonians*, some *an extinct division of our species.* The commonest slave-dealer of Byzantium or Olbiopolis could have told us more than all the learned men since employed on such subjects.

We approach our own times, and the field of observation enlarges. Africa is circumnavigated, the parts beyond India visited, America discovered. The world becomes known in its extremities as well as in its centre. Nevertheless, the human naturalists anterior to Buffon and Linnæus, are like the great men who lived before Agamemnon.

Buffon made a general history of man, as well as a theory of the earth, important portions of his great work, prominent and full. Buffon gives us description rather than classification; Linnæus classification rather than description. How thoroughly zoological is the following table from the first edition of the *Systema Naturæ.*

QUADRUPEDALIA.

Corpus hirsutum, pedes quatuor, feminæ viviparæ, lactiferæ.

ANTHROPOMORPHA.

Dentes primores iv utrinque vel nulli.

HOMO	............Nosce teipsum.......H.	Europæus albescens. Americanus rubescens. Asiaticus fuscus. Africanus niger.

	Posteriores anterioribus similes...	Cercopithecus. Cynocephalus.
BRADYPUS	...Digiti 3, vel. 2. Digiti 3.	Ai ignavus. [1]Tardigradus,

In 1790, the first decad of the anatomical descriptions of Blumenbach was published, the special part investigated being the cranium; and that with a view to ethnology rather than to anthropology.

Little was said about the *differentiæ* between the human skull and the skull of the higher apes; much about the distinctions between crania from America, crania from Asia, and crania from Africa. The last pentad of these researches was published in 1820. It is Blumenbach to whom we owe the division of mankind into the following five classes; (1.) the Caucasian; (2.) the Mongolian; (3.) the Æthiopic; (4.) the American; and (5.) the Malay; the nomenclature also being Blumenbach's. Of the five terms before us, the second, the fourth, and the fifth are current without being inconvenient. The third (Æthiopic) is rarely used. The first (Caucasian) is unfortunately as current as it is both incorrect and inconvenient.

The *Règne Animal* gives the anthropological characters of man fully, placing him as the only species of the genus *Homo*, the only genus of the order *Bimana*. The ethnology is that of Blumenbach modified, the Malay and American divisions being subordinated to the Mongolian. Meanwhile, our improved knowledge of New Holland and New Guinea had given prominence to the Australian and Papuan varieties—varieties which somewhat complicated the previous classifications, but which were too slightly investigated to create an entire revision of it.

It was the anatomists and zoologists that gave to ethnology its naturalist aspect. The philologues, on the other hand, viewed it as historians.

Philological ethnology has advanced, at least, as rapidly as physiological. We may also add that it began earlier. As early as the voyage of Magalhaens, vocabularies of languages, which could only be valuable as ethnological materials, were collected—Pigafetta being the collector. Reland knew of the existence of Malay words in the Island of Madagascar. Leibnitz had speculated on the Bask language. The Abbé Hervas established a voluminous correspondence with the missionaries of the *Propaganda* wherever they were found, and his *Saggio del Universo* gives us the results. In 1801, the *Mithridates* of Adelung appeared, giving specimens, more or less imperfectly classified and analyzed, of all the known languages of the world. Notwithstanding all this the world had yet to see a special and proper ethnologist. No philologue had known much of either anatomy or zoology; no anatomist or zoologist of philology. Nor yet had any one seen the subject in its full dimensions, or treated it otherwise than as an accessory to some other department of knowledge. With the naturalist it was an adjunct to zoology, with the scholar to comparative philology. The first who combined the two methods of investigation with a full perception of the magnitude of the subject was Dr Prichard—no special naturalist, no special anatomist, no special philologue, but enough of all to make him the first and last of ethnologists. Such is his position, and in it we get a measure of the extent to which his subject is a new one.

The present author will now lay before his readers an exposition of the primary divisions and main sub-divisions of Mankind, reserving his criticism until the classification has been completed, premising that it is only where it differs from that of Dr Prichard that he feels that any real opposition of doctrine is encountered. The groups of all other writers must be looked upon as groups founded upon partial and incomplete examinations, groups formed (so to say) under no *ethnological responsibility*, but merely as extraneous speculations—so much zoology, so much anatomy, so much history, or so much philology having been diverted into a new and near channel.

This is only, however, to the writers who have delivered opinions upon *general* and *systematic* ethnology that this applies. The authorities that, upon any special division of the subject, demand respect and attention are numerous. To go no further than the limits of the English language, we have for American ethnology the names of Morton, Gallatin, Hale, Schoolcraft, and others—for Malay and Indo-Chinese, Leyden, Crawfurd, Logan, Earle, &c.—for Indian and Himalayan, Hodgson, and many others besides.

What portion of the earth's surface is it best to start with? It is as certain that this is an inquiry of considerable practical importance as that it is one to which a variety of answers may be given. It is important, because the question as to the dispersion of mankind over the earth implies the existence of some special locality as a starting-point; and the starting-point being given, a tendency arises to attach to it what we have called the *typical standard* or *average* sample of our species. However much we may guard against these views, they continually obtrude themselves on our attention. On the other hand, the answers concerning the point of the earth's surface, and the division of the earth's inhabitants, with which it is most convenient to begin, are numerous. They differ with the point of view favoured by the inquirer. The zoologist, the philologist, answer differently. The starting-point that purely zoological considerations more especially suggest are the countries of the anthropoeid (or anthropomorphic) apes, countries which agree with each other in being intertropical (indeed equatorial), but which lie in distant meridians—Western Africa and the southern extremity of Asia—the banks of the Gaboon and Borneo. Purely naturalist in our view, we may argue not only from the general phenomena of the geographical distribution of animals, but also from the natural conditions of human life as compared with the artificial. In the protoplasts of his species the zoologist sees but so many naked bipeds, with the capabilities, indeed, of working out for their future behoof the essentials of clothing, the use of fire, and the like, but, *in the first instance*, intolerant of any climate but the mildest, and incapable of sustenance on any soil but the most luxuriant. Hence, from the purely zoological point of view, the tropics are the cradle of our kind; and of the intertropical points, the habitats, or the parts about them, of the anthropoeid apes. The philologist, on the other hand, looks towards China, Tibet, and the Trans-Gangetic Peninsula; inasmuch as the peculiar character of the languages of these parts arrests his attention. They are monosyllabic, and destitute of inflexions. Such being their character, they are reasonably supposed to give us the simplest existing forms of human speech. Whether this view be right or wrong, it evidently favours the area of the so-called monosyllabic tongues being taken at the beginning of any ethnological exposition.

Another centre is what we call the logical one—logical because it is formed upon general rather than special grounds, and because it is based upon the principle that *forces must not be multiplied unnecessarily*. If the earth were one large circular island; if its populations were admitted to have been diffused over its surface from some single point, and if that single point were at one and the same time unascertained and requiring investigation, what would be the method of our inquiries? I suppose that both history and tradition are silent, and that the absence of other *data* of the same kind force us upon the general probabilities of the case, and a large amount of *à priori* argument. We should ask what point would give us the existing phenomena with the least amount of migration, and we should ask this upon the simple principle of not multiplying causes unnecessarily. The answer would be—the *centre*. From the centre we can people the parts about the circumference without making any line of migration longer than half a diameter, and without supposing any one out of such numerous lines to be longer than the other. This last is the chief point, the point which more especially

fixes us to the centre as a hypothetical birth-place, since the moment we say that any part of the circumference was reached by a shorter or longer line than any other, we make a specific assertion requiring specific arguments to support it. These may or may not exist. Until, however, they have been brought forward, we apply the rule *de non apparentibus*, &c., and keep to our conventional and provisional point in the centre—remembering, of course, its provisional and conventional character, and recognising its existence only so long as the search for something more real and definite continues.

Under any or all of these principles some portion of Southern Asia becomes our starting-point. Let the particular area be the Trans-Gangetic or Indo-Chinese peninsula, an area which coincides with none of our views exactly, but approximates them all. Of course it is, more or less, conventional, hypothetical, and provisional. It is by no means said to give us the cradle of our species. It is only said to be a convenient centre from which we may follow out so many lines of migration in so many different directions.

A.

ASIATICS AND NORTHERN EUROPEANS—POLYNESIANS, AMERICANS.

CLASS I.

Contains those populations whose physical conformation is, either typically or sub-typically, MONGOL, having been generally recognised as such.

Area.—Northern, Central, and South-Eastern Asia; Northern Europe.

DIVISION I.—*Languages monosyllabic.*

Populations.—The Burmese, Siamese, Tibetans, Peguans, Kambogians, Cochin-Chinese, Chinese, various mountain tribes, Nepalese, Lepchas, Limbus, Chepang, Kocch, Bodo, Dhimal, Assam hill tribes, Islanders of the Indian Archipelago, the Nicobar and Carnicobar Isles, the Andamans.

The language of all the members of this group is not only monosyllabic, but destitute (or nearly destitute) of inflections. We may add, that the absence of inflections arises from the fact of their non-development—not from development followed by subsequent loss. The colour of the skin varies from a light yellow to almost black, the colour of the hair being more uniform, as also its texture. So is the stature—most of the populations under notice being undersized rather than over-sized. The civilizational forms are extreme, *i. e.* there is the proverbial industry of the Chinese at one end of the chain, at the other the barbarism of the Andaman Islanders. The Chinese section of this group is far greater than all the others put together, hence (if we look only to the number of individuals) the religion of Fo is the dominant creed. The smaller and obscurer tribes of the mountain ranges between Cochin-China and Cambogia, Cambogia and Siam, Siam and the Burmese Empire, China and Assam, the Burmese Empire and Arakhan, claim, on the part of the ethnologist, an amount of attention that the civil historian has never yet given them. The Andaman Islanders are placed in this group on the strength of the language. Their colour is against their belonging to it.

DIVISION II.—*Turanians—Languages other than monosyllabic.*

Turanian area (either now or originally).—Mongolia, Mantshuria, Siberia, Tartary (Independent and Chinese), Turkestan, Anatolia, Rumelia, parts of Persia, Armenia, Syria, the Crimea, Lapland, Finland, Esthonia, Livonia, Courland, governments of Archangel, Olonetz, Novogorod, Twer, St Petersburg, Yaroslav, Vologda, Permia, Viatka, Kazan, Astrakhan, Simbirsk, Saratov, Nizhgorod, Penza, Tambov—Hungary—the Kurile Isles, Kamskâtka, Japan.

Groups.—1. The Mongolian; 2. the Turk; 3. the Ugrian; 4. the Tungûs; 5. the Peninsular.

1. *The Mongolians.*—Mongolia is part of the largest steppe in the world, extreme in climate, and poor in soil, and the Mongolians are the most nomade of populations, their physiognomy and habits being uniform over a vast extent of country. The skull is broad, the face flat, the eyes oblique, a crescentic fold at the inner angle separating them in appearance more than they are in nature. The extent to which the Mongolian physiognomy has been considered typical has already been noticed. That the calves of the legs are undeveloped is no more than the natural effect of their equestrian habits. A tent is the house, milk and flesh the food of the Mongolian. Of the milk, when fermented, he makes his intoxicating drink, *kumiss*.

Temudzhin (Jenjiz-khan) is the hero and conqueror who has given the Mongolians their chief historical importance, China being the point towards which the edge of the Mongol sword has most turned. But the spirit of conquest has long been dead. The Mongolians under China are peaceable Buddhists, eminent for their amenability to priestly influence. Some few of them are independent, others subjects to Russia, where they are known as Kalmuks. Of these some have been imperfectly Christianized. The Kalmuks of the governments of Caucasus and Astrakhan are a colony. So are some small Mongol settlements in Cabul.

2. *The Turks.*—*Turk*, in ethnology, is a word of a very wide import. It denotes all the populations whose language is allied to that of the Turks of the Ottoman Empire. These, indeed, are best called *Osmanli*, while *Turk* means the Turcomans, both of Asia Minor and the Persian frontier, and a vast number of important tribes besides. No division of our species surpasses this in interest and importance. The original Turk area is of the largest. Conquest and encroachment have made it larger still—conquest and encroachment in every direction. How far this has moved westward we know, for we know that the Osmanli Turks of Turkey are the latest invaders of Europe. In Asia Minor they are older occupants, but even there they were originally invaders. They are to be found, mixed with Arabs, in Syria and Palestine, even to the frontier of Arabia. Their great centre, however, is Independent Tartary. From this they have spread as far east as Chinese Tartary; for, not only are the Uzbeks of Bokhara Turks, but the tribes of Khoten and Yarkend are Turks also. Bounded on the east by the Mongols, the Turk area prolongs itself northwards; and that to the very verge of the Arctic Sea. The Lena is a Turk river, and the Yakut Pagans who occupy it speak a language closely akin to the Osmanli of Constantinople. Add to this that all the *Tartars* (so-called) of the Russian Empire belong to the same stock. In Kazan, Astrakhan, and the Crimea, they have founded empires, and attained a civilization like that of the Ottomans. In Orenburg they are, perhaps, as much Ugrian as Turk—this being the view taken of the Bashkirs, whose language, however, is undoubtedly Turk. The Barabinski steppe is Turk. Nogays (wherever found) are Turk. The numerous tribes, more or less isolated, on the Upper Obi, and Yenesey, are Turk. So are some as far eastwards as the Lake Baikal. In Caucasus the Karatshai and Basiani are Turks. With an area so large, the Turk family is subjected to almost every physical influence. Again, it occupies some of the highest inhabited levels, *e. g.* the table-land of Pamer, at the head of the Oxus. As far as any general statement can be made in respect to its distribution, it may be said that it is an *overland* one. Few Turks are in any of the maritime localities, or on any of the deeply indented sea-boards. Again, the Turk area is fitted for a pastoral, rather than an agricultural life. Still, there are excep-

tions. Along the Jurgan and Lower Oxus, the Turcomans, who are elsewhere so pastoral, are industrial tillers of the soil. What applies to the Turk habits applies also to the Turk creed. As a general rule they are Mohammedans, just as (as a general rule) they are pastoral. Yet many of the Turks under Russia are Christians, whilst the Yakut are Pagans. A few perhaps, on the Mongol frontier are Buddhists. Part of the Turk area is covered with archæological remains,—which yet remain to be accurately investigated, *e. g.* the Russian governments of Kazan, Astrakhan, Saratov, as well as Independent Tartary. So is the Crimea. Neither the Turks nor the Mongols have been eminent as builders of cities. Mohammedan as is the Turk religion in general, it was, nevertheless, preceded, in some parts at least, by Christianity. Hence, the earliest Turk alphabet—which was of Syrian origin, introduced by the Nestorian missionaries, the Uighur form of speech being the one to which it was applied. From the Turks the Mongols took it, from the Mongols the Mantshu. In physiognomy the Turk is Mongolian; the Osmanli of Europe and, in a less degree, the Turkoman of Asia Minor, being exceptional sections modified by intermixture. The family is pre-eminently a family of conquerors. Tamerlane, the Seljukians, and the Osmanli, were Turk. The obscure conquest of the valley of the Lena by the ancestors of the present Yakuts was Turk. There is evidence—whether good or bad is doubtful—that one of the early conquest of China was Turk. A case may be made in favour of Asia Minor and Syria having been overrun by Turks long before the Seljukian period, and, indeed, the very dawn of history. A case can be made out for the Parthians (and possibly the Persians) having been Turk. That the Comanians, Uzes, Petshinegs, and Avars, were Turk, is certain. It is almost certain that the Huns of Attila were the same—probably the Bulgarians also (though now Slavonized). Lastly, the Scythians of Europe were Turk, rather than ought else.

The chief divisions are—the Kirghiz and less important tribes in Independent Tartary, the Uzbeks of Bokhara, the Turks of Chinese Tartary (of Uighur origin), the Turcomans, the Basiani and Karatshai of Caucasus, the Osmanli, the Crim Tartars, the Nogays, the Bashkirs (of mixed blood), the Barabinski, &c., of Siberia.

3. *The Ugrians.*—The Ugrian family is common to both Asia and Europe, being the most western member of the former, the most eastern (north-eastern) of the latter, continent. The Uralian range lies well-nigh in the centre of its area. As compared with a Mongolian, a Ugrian has a European—as compared with a German, a Mongol, physiognomy. The hair is often red; indeed, the Ugrian is the first great section of our species where a light complexion becomes anything like general. Placed between two great powers—the Turk and the Russian—the Ugrian family has been greatly encroached upon, greatly broken up; so that at present it presents but fragments of its former greatness. Originally, I think it extended from Caucasus to the Icy Sea, from the Dnieper to Behring's Straits—an area not less, but rather greater, than that of the Turk, Nine-tenths of what is now Russian was once Ugrian.

The primary divisions into which this stock falls are—(1), the Eastern; (2), the Western, Ugrians.

1. The *Eastern* are the Samoyeds, the Yeniseians, and the Yukahiri, all populations of Asia, the Yukahiri being the most eastern. None of these are in contact with each other, inasmuch as northern offsets of the Tungûs and Turks separate them. They are all nomades—all in the *tundra* rather than in the forest.

2. The *Western* Ugrians consist of the Laplanders, the Finlanders, the Permians, Siranians, and Votiaks of the Russian governments of Perm, Vologda, and Viatka; the Tsheremiss, the Mordvins, the Tshuvash, on the middle Volga; the Voguls and Ostiaks on the ridge of the Ural mountains, and along the rivers Obi and Yenesey; and, finally, the Majiars of Hungary. Between the extreme types there are broad differences, *e.g.* between the Laps and Majiars. So there are in respect to their social and intellectual histories.

The two great representatives of Ugrian stock are, (1), the Finlanders of Finland, and (2), the Majiars of Hungary, the latter being recent conquerors and intruders, the date of their conquest and intrusion being the tenth century. That the difference between the Finlander and the Lap is so great as it is, must be accounted for by the displacement of transitional forms. All Norway and Sweden was once Lap. So was Courland, and, perhaps, certain districts still farther west. The Ugrian creeds are either Christian or pagan, there being little or no Mohammedanism, except, of course, where there has been Turk intermixture. At present the most southern Ugrians (laying the Majiars out of the account) are the Mordvins of the governments of Saratov and Astrakhan.

Few suggestions as to the early history of the more obscure nations are more important than that of Mr Norris respecting the third language of the Arrowheaded Inscriptions. It is to the effect that it was Ugrian. If so, the Ugrians from the southern part of the Uralian range may have overrun Persia several centuries B.C., just as certain Majiar Ugrians overran Hungary and Transylvania several centuries A.D.

The Samoyeds have been added to the Ugrian family by Castren, the Yeneseians and Yukahiri by the present writer. It is doubtful whether the group has yet attained its due dimensions. Possibly the Eskimo may have to be added to it, as well as some American tribes. Possibly, also, the Kamskadale and Koriaks; an addition affecting the value of the Peninsular group.

4. *The Tungûs.*—The Tungûs area lies to the north and east of the Mongol. On the drainage of the Amur the older geographical names are Tungûs, the newer Chinese. This shows that the latter nation is the encroaching one. On the other hand, it is Tungûs dynasty (the Mantshu) that is dominant in the Celestial Empire. Divided in their political relations between Russia and China, the Tungûs differ from each other in creed. In China they are Buddhist, in Russia imperfect Christians and pagans. The Mantshus have adopted the Mongol alphabet. Upon some of the tribes to the north of them the Tungûs have encroached and effected displacements, the probable direction having been from south, or south-east, to north. Their appearance in history is late, inasmuch as their area lay beyond the pale of Greek, Roman, and Arab intercourse. It is the Chinese who most mention them; a tribe called *Niuju* more especially. This term (Niuju), Daurian, Tshapodzhir, Mantshu, and Lamut, are the most currently known names of the Tungûs family. The Tshapodzhir tattoo their faces. The different zoological regions of the Tungûs area give us the divisions of the *Horse* Tungûs, the *Reindeer* Tungûs, and the *Dog* Tungûs. The Tungûs has encroached upon the Ugrian area, isolating certain members of it, *e.g.* the Yukahiri.

The word *Tungûs* = *donki* = *man*, a root that reappears in the Yeniseian, and more than one American language. *e.g.* the north-western dialects of the Athabaskan (*vid. infra*).

5. *The Coreans, Japanese, Kurile Islanders, Kamskadales, and Koriaks.*—I throw all these into a single class of value as yet undetermined. I suggest for it the name *Peninsular*, from the extent to which its area is affected by the neighbourhood of the sea. In the way of language, the affinities of these populations are Tungûs and Ugrian rather than monosyllabic, their physiognomy being unequivocally Mongolian. The civilization varies; the proximity of China having told favourably on Japan, less favourably on Corea, and little at all on the Kurile Islanders. Of the Kamska-

dale peninsula the aborigines are nearly extinct. Not so the Tshuktshi of the coast of the Arctic Ocean. *They* hold their own bravely; bold in temper, strong in body.

Ermann has remarked that the Kamskadale and Ostiak languages appear liker each other than either are to the intermediate tongues, *e. g.*, the Tungús and Mongol. If so, we see our way to the possibility of the Peninsular group (either wholly or in part) becoming subordinated to the Ugrian. Probably, too, the Kamskadales and Koriaks belong to one and the same division of this group. The Peninsular, Ugrian, and Tungús forms of speech are the most American of the Asiatic languages, the Tshukshi being also American in physiognomy.

CLASS II.—IRANIANS.

GROUPS.—1. The Persians; 2. the Paropamisans; 3. the Armenians; 4. the Dioscurians (*i. e.*, the Caucasians of Caucasus, or Caucasians in the limited, proper, and convenient sense of the term).

Physiognomy.—Caucasian (in the general, Blumenbachian, and inconvenient sense of the term) rather than Mongolian; in some cases Mongolian.

Languages.—Pauro-syllabic (*i. e.*, of so few syllables as to approach the monosyllabic character). Inflections few; probably, in all cases from non-development rather than loss; certainly so in the Dioscurian division.

Area.—Kurdistan, Persia, Afghanistan, the Kohistan of Cabul, Bokhara, Kafiristan, Armenia, Caucasus.

1. *Persians.*—Divided into Persians Proper, Kurds, Bilúch, Afghans. Shiite Mohammedans, and fire-worshippers in religion. Christianity rare.

The Persians of history must be looked upon as a mixed race, large infusions of Turanian blood having been introduced from the northern frontier. In the comparative compression of the cheek-bones, the oval outline of the face, and the prominence of the nasal bones, we find wide departures from the Mongol type. Aquiline noses first appear in this group, just as red hair first appeared with the Ugrians. The philology of Persia is closely connected with that of India.

2. *Paropamisans.*—Occupants of the ancient Paropamisus, *i. e.*, the Kohistan of Cabul.

The so-called Kafres of Kafiristan, to the north of Peshawer, give us the type of this division—which, perhaps, should be subordinated to the proper Persian. The Kafres still retain the paganism of the times anterior to Mohammedanism. Their country is inaccessible, so that they are amongst the obscurest tribes of Asia. Their physical appearance is fine. The Chitrali, Dardoh, probably the Cashmirians, along with certain fragmentary populations of Cabul, are Paropamisan.

3. *Armenians.*—The features more massive than those of the Persian; the creed Christian rather than Mohammedan; the language, as also the alphabet, peculiar; the civilization old. Like the Jews, the Armenians are scattered beyond the limits of their own area.

4. *Dioscurians.*—This is a term suggested by the author. It is taken from the town *Dioscurias*, wherein Pliny says that 130 interpreters were wanted; so numerous were the dialects of Caucasus. They are numerous now. Hence the suggestion of the word instead of the awkward term *Caucasian in the limited sense of the word*, a circumlocution otherwise necessary from the Blumenbachian use of the adjective in another sense.

In the western Caucasus the physiognomy is Persian rather than Mongolian; in the eastern it approaches the Mongolian. The language has its nearest affinities with the Tibetan and other monosyllabic tongues; a statement which, in the case of the *Irôn*, many philologues are indisposed to admit. The sections and chief subsections of the Dioscurians are as follows:—

1. *Circassians.*—Adighé, Abassians, Kabardinians, &c.
2. (*a*) *Tshetsh* or *Mizhdzhedzhi.*—Central and on the watershed between the Terek and Kuban rivers; probably to be subordinated to the—

(*b*) *Lesgians*, or Eastern Caucasians.—The Avars, the Anzukh, the Andi, &c.

3. *Irôn*, or *Osset.*—Central and on the watershed between the Kuban and the Kur.
4. *Georgians.*—Mingrelians, Imeretians, Suan, Lazians, and Kartulinians.

CLASS III.—INDIANS.

In India we have a physiognomy referable to two types, one Persian rather than Mongol, the other Mongoloeid. In each case the skin is dark, *i.e.*, brunette, or black. The chief creeds are Buddhist and Brahminic. The languages for the south are undoubtedly of Tamul origin. For the *north*, see LANGUAGE, *Notes.* Among many of the hill-tribes neither of the leading religions have yet struck root. Hence the original paganism of the peninsula still remains.

The minute ethnology of India is as interesting as it is complicated. It is the ethnology of a country of castes; of a teeming, ingenious, and industrious, but rarely independent population; of an ancient literature and an ancient architecture. It is a country which, whatever may have been the origin of its own civilization, helped to civilize the majority of the countries of the monosyllabic languages—Ava, Tibet, Siam, and (more than is generally believed) China. To the Brahminic and Buddhist religions India stands in the same relation as Arabia does to Mohammedanism.

In all Indian investigation we must bear in mind that there is one native and at least two foreign elements. Of the latter, one is that of the populations akin to the Nepalese and Tibetans whose area at one time reached the Ganges. The other is that of the speakers of the Sanskrit language, whoever they were and whensoever they came. According to some, they were originally strange to the north as well as to the south of India, whilst from the *south* every one excludes them.

The languages wherein the Tamul character is undoubted are the Tamul Proper, the Kanara, the Telinga, the Tulava, the Malayalam, and the Coorgi forms of speech (all in the south); along with most of the dialects of the hill-tribes, one of which, the Rajmahal mountaineers, lies as far north as the Ganges, and within 100 miles of the most southern of the monosyllabic languages, *i. e.*, the Garo.

The languages wherein the Sanskrit elements make the original Tamul character doubtful, are the Punjáb, the Multán, the Sind, the Gujerati, the Rajputana, the Hindi, the Bengali, and the Udiya forms of speech.

CLASS IV.—THE OCEANIC STOCK.

Area.—The Peninsula of Malacca; the Islands of the Indian Archipelago, Chinese Sea, and South Sea; Madagascar, New Guinea, Australia, Van Diemen's Land; *i. e.*, Islands or Peninsula; whence the term *Oceanic.*

Primary Divisions.—(1.) Amphinesia; (2.) Kelænonesia.

Physiognomy.—When Amphinesian, more Mongol than African; when Kelænonesian, more African than Mongol.

Language.—When Amphinesian, with patent and recognised affinities to the Malay; when Kelænonesian, with Malay affinities fewer and only partially recognised.

The Turk group illustrates the diffusion of man over a *continent;* the group before us the distribution of man over the *ocean.* The spread of a population over a continent is *continuous;* its spread over an ocean *interrupted*, or, at any rate, liable to interruption. Thus Gaul, most probably, began to receive a population as soon as the parts in contact with it were full. Britain, on the other hand, may have remained a solitude for centuries and millenniums

after Gaul had been over-peopled. Unless we imagine the first canoe to have been built simultaneously with the first demand for water transport, it is as easy to allow that a long period intervened between that time and the first effort of seamanship as a short one. Hence the date of the original populations of *islands* is not in the same category with that of the dispersion of men and women over *continents.*

Now, great signs of the *interruption of migration* present themselves in the ethnology of the Oceanic Stock; and it is only by the admission of these that the group becomes natural—these and the evidence (often obscure) of language, along with the phenomenon of transitional, or intermediate, forms.

AMPHINESIANS.—These fall into

1. *Protonesians*, or occupants of the Indian Archipelago and Chinese Sea, Sumatra, Borneo, Java, Moluccas, Philippines, &c.; the names being derived from πρῶτος, *first*, and νῆσος, *island*, these being the islands *first* occupied from the Continent. The chief populations here are Malays, Dyaks, Javanese, Bugis, and Philippine Islanders.

2. *Micronesians* of the Caroline and Marianne Islands.

3. *Polynesians*, of the South Sea Isles, in general, from the Sandwich Islands to New Zealand, from the Fijis to Easter Island.

4. *Malagasi* of Madagascar.

KELÆNONESIANS.—1. Papuans of New Guinea; Louisiade, New Hebrides, Tanna, Mallicollo, and New Caledonia; 2. Tasmanians; 3. Australians.

Κελαινὸς, *black; ἀμφὶ, about, around.*—A reference to the map will now explain the nomenclature. Polynesia is considered to have been peopled from Southern Micronesia, Micronesia from the north-eastern part of Protonesia (*i. e.,* from the Philippines, *via* Lord North's Island, the Pelews, &c.) If so, the Amphinesia migration laps *round* the Kelænonesian, which is deduced, for Australia, from Timor, for New Guinea, from the Arru Isles. Tasmania has such remarkable affinities with the Papuan Islanders, that even there the population seems to have come *round* Australia rather than across it. The Kelænonesian civilization is far lower than that of the Amphinesian. Thereof much of the Protonesian part is Mohammedan, a portion Christian, a portion Brahminic, a portion still Pagan. There is also more than one Protonesian alphabet, *e. g.,* the Batta, the Rejang, the Lampong, the Javanese, the Tagala. In most of the Protonesian islands, as well as in the Malaccan Peninsula, there are certain wild tribes, many of which are blacker in skin than the ordinary Malay, Javanese, Dyak, &c. These may be called the *Negritos* of the Malay, or Amphinesian area. In no case where their language has been examined has it been found to be Kelænonesian; nor yet has it been found to differ from the Protonesian dialects of the parts around it more than the Protonesian dialects differ from each other. The generality of writers have separated these from the Malays; some connecting them with the Papuans or Australians. The present writer does not do this. He sees in them only so many members of the ordinary Protonesian group in a ruder and more primitive state. Nevertheless, it was when this state was general, and the ordinary colour of the Protonesians darker, that he believes the migration by which New Guinea and Australia were peopled to have taken place.

In the Fiji islands, the Papuan and Polynesian characters are intermixed, just as if the stream of population that went round Kelænonesia and the extreme Kelænonesians met. The Papuan is one of the least known sections of mankind.

CLASS V.—AMERICANS.

As long as the north-western parts of America were so imperfectly known as they were till within these last few years, the origin of the American population was uncertain; inasmuch as the Red Indians and the Eskimo on the *eastern* side of the Continent stood in strong contrast to each other; the transitional or intermediate forms having been obliterated. We no sooner, however, study the tribes of Russian America and the Oregon, than all such contrasts disappear. The Eskimo of the *west* graduates into the Indian of the *west.* Neither are there wanting direct proofs of philological affinity between the languages of the parts in question and those of the Tungûs, Peninsulars, and Ugrians.

The classification of the divisions and sub-divisions of the American group (a group of value yet undetermined) has yet to take its final form. Provisionally, however, we have the following arrangement:—

Eskimos in Greenland, Labrador, the coasts of the Arctic Sea, Russian America, the Aliaskan Peninsula, the Aleutian Isles, and the extreme north-east of Asia. *Kolúch* in the parts about Sitka, with affinities to the Eskimo on the one hand, and, on the other, to the *Athabaskans*, whose area subtends that of the Eskimo, and reaches from the Pacific to Hudson's Bay. The chief divisions of the Athabaskan group are the Chepewyans, the Beaver, Strong-bow, and other northern Indians, the Takulli, the Sikanni, the Sussees, the Loucheux, the Kenays, to which we may add outlying members as far south as Mexico, viz.: the Kwaliokwa and Tlatskanai on the Californian frontier, the Navahos, and Jecorrillas, and Apatches of California and Mexico. No group has its members lying further north and south of each other than the Athabaskan, some being within the Arctic Circle, some within the Tropics, the southern members isolated. Of equal magnitude with the Athabaskan group is—

The Algonkin, to which the majority of the Indians of the United States are referable, some as far north as Labrador, some as far south as Tennessee. The Delawares, Ojibways (different from the Athabaskan Chepewyans), and more than 30 other tribes are Algonkin.

The Iroquois group contains the Oneydas, Hurons, Wyandots, Senecas, Cayugas, Mohawks, &c.

The Sioux, the Ioways, Minitarees, Osages, and numerous tribes of the parts between the Mississippi and Rocky Mountains.

The *Woccons, Catawbas, Cherokees, Chochtas, Creeks and Caddo,* have all Sioux and Iroquois affinities, and may probably have, under some future classification, to form with those two groups one large class.

Paducas.—This means the tribes that speak languages akin to the Comanch, numerous in Oregon, California, Texas, and Mexico.

Texas and the south-western parts of the older states give us a vast mass of small tribes still requiring classification, Uche, Coosadas, Alibamas, Taenzas, Pascagoulas, Colapissas, Biluxis, Chetimachas, Humas, Tuncas, Pacanas, Natchitoches, Adahi, Opelusas, Attacapas, Natchez. Neither are the Riccarees, Pawnees, and Ahnenin (Fall Indians), further north classed.

In New Caledonia, Oregon, and California, we have

On the coast—The Haida, Chemmesyan, Billechula, Hailtsa, Chinuk, and Nutka tribes.

In the interior—The Atnas (Shushwah), Cutanis, and Sahaptins.

Add to these Jakons, Molele, Cayûs, Kalapuyas, Lutuami, Saintsila, Shastis, Palaks, &c.

In California a large portion of the Indians is either Athabaskan or Paduca. Still, there are several unclassed tribes. In the direction of New Mexico, and in New Mexico itself, we have the so-called *Puebla* Indians, partially unclassed—Moqui, Zuni, Taos, &c. In Old California, we have the Cochimi and Pericu tongues. Sonora gives us the Pimo and Coco-maricopas, the Opata, Ciri, and Jaqui languages. Further inland lie the Cora and Tarahumara, leading to

Mexico, where the chief form of speech is the Aztek, not without many others (the Tarasca, the Otomi, &c.) around it. In Central America the Maya is preponderant—also with numerous minor languages around it. In Nicaragua the Mexican reappears with the Dirian, Chontal, and other forms of speech, lately illustrated by the researches of Squier in its neighbourhood. The Moskito, the Bayano, &c., lead us to the South American, where the Muysca section takes the same prominence in New Grenada that the Aztek did in Mexico, the Maya in Guatimala, and the Quichua, will take in Peru.

These give us the *maximum* amount of American civilization; a civilization which we either infer from the architectural and other remains spread over the Mexican and Peruvian areas, or else find described in the writings of the early Spanish conquerors. Undoubtedly, these supply us with some strong contrasts to the rudeness of the ordinary American Indian of the lake districts and prairies. They are differences, however, of degree rather than kind, as may be seen by taking the chief characteristics of the Mexican and Peruvian culture, and asking how far they appear in a rudimentary form elsewhere. Assuredly, some of the most important will be found amongst tribes of far less historical prominence than the ones in question. The existence of such an empire as Montezuma's is, undoubtedly, a measure of the Aztek civilization. Yet the obscurer one of Powhattan in Virginia exhibited an equal amount of organization. The phrase *picture-writing* applies to some of the imperfect historical records of the same country. Yet it is but the daub of the Pawni, or Algonkin in an improved form. The agricultural and metallurgic industry of the Anahuac and Cordillera has its origin quite as much in the physical conditions of the soil and climate as in any original intellectual superiority on the part of its occupants; besides which, it is approached by that of the Puebla Indians. The Mexican arithmetic has long commanded attention. It not only gives us a simple term for 20, but also one for 400 and 8000. Much stress has been laid upon this so-called vigintesimal system. There is reason, however, for referring it to a very common-place origin. *Twenty* = *man* (*i. e.* ten fingers and ten toes). *Twenty* men made the first division of the Mexican army—say a *company;* 20 of these made (say) a *regiment;* 20 regiments an *army*. This we infer from the symbols for 20, 800, and 4000, which are also those of the three military divisions just enumerated. We cannot, with such a fact as this before us, credit the Mexicans with having an extensive multiplication table. They may have been unable to count the intermediate numbers between 40 and 400, or even between 20 and 40. Another line of argument has helped to isolate these civilizations. Wherever similar characteristics appear they have been called, off-hand, Mexican or Peruvian, as the case might be. Nevertheless, the truer inference from the fact of certain architectural remains, &c., being found over a vast tract of country is, not that there has been a certain amount of conquest or colonization, but that more divisions of the American population than one have worked in the same way on similar materials.

Language, too, has helped to isolate. The Otomi tongue has long been known to be eminently monosyllabic. But there are others in the same category, *e. g.* certain Athabaskan dialects, the Attacapa, &c.

Again, many American nations flatten the skull artificially, and are known to do so; others are found with it flattened, but are not known to flatten it. Hence, we get the possibility of such a phenomenon as *naturally* flat crania, a phenomenon on which many authors insist. If their view be accurate, it gives us a physical distinction of great value, amounting, perhaps, to a specific difference. The *natural* character, however, of the skulls in questions is, as yet, unproved. Such are some of the *differentiæ*—physical and moral—between the more extreme American populations; and it must be admitted that they cannot all be explained away without a considerable amount of assumed influences. The more, however, these are studied, the more probable they appear. The more, too, we go into the details of the division itself, the more we find transitions and intermediate forms.

The great South American families of which the limits are the most defined are—1. The Quichuas. 2. The Caribs. 3. The Guarani; the Chaco, the Pampa, and the Chileno groups being of somewhat less, though still of considerable, magnitude.

1. The *Quichua* section follows the line of the Andes from the equator to S. Lat. 28., extending, at one point, as far east as Tucuman.

2. The *Caribs* have the same prominence in Venezuela that the Quichuas have in Peru and Bolivia. They extend from New Grenada to French Guiana. In Trinidad, part at least of the early population was Carib, as it was in the Antilles.

The Quichuas are mountaineers. The Caribs seem to have followed the courses of the rivers—being *fluviatile* so to say. More fluviatile, however, than the Caribs are

3. The *Guarani*. Guarani or Tupi forms of speech are found at the mouth of the Amazons, also at the mouth of the river Plata, also on the intermediate coast. In Entre Rios, Corrientes, and Paraguay, it spreads inland. On the watershed of the Amazons and Plata, in the province of Santa Cruz de la Sierra, the Chiriguanos, Sirionos, and Guarayos, are Guarani. Again, on the Napo and Putumayu, the Omaguas are Guarani also. Hence, the best provisional view that we can take as to the diffusion of so important a stock, may be to consider the Siriono and Guarayo districts as the original localities. These are common to two river-systems; so that, starting from these, the Omagua branch may have reached the Amazons, whilst the Guarani reached the Parana and Uruguay rivers. Still the view is only provisional.

Next to the Quichuas, the Guaranis give us some of the most civilized tribes of South America. On the other hand the *Mundrucu*, of the middle Amazons, can be shown by their language to be Guarani; the *Mundrucu* serving as the very type and standard of savage wildness. When a *Mundrucu* has slain an enemy he cuts off his head, extracts the brain through the occipital *foramen*, washes the blood away, fills the skull with cotton, and then converts the whole into a kind of mummy, by drying it before the fire. The eyes he gouges out, and he fills up the orbits with colouring matter. Thus prepared, the head is placed outside his hut. On festive occasions it is placed at the top of a spear. Such is the history of the head of an enemy. Those, however, of friends and relations are preserved and kept, though with certain differences of detail. Thus on certain days dedicated to the obsequies and memory of the dead, the widow of the deceased takes a skull, seats herself before the cabin, and indulges either in melancholy lamentations, or in fierce encomium; the assembled friends meanwhile dancing round her.

The Chileno-Patagonians. The name is more expressive than convenient. It indicates, however, by its very composition, the magnitude of the group to which it applies. When we get into Chili, we arrive beyond the limits of the Quichuas and a new family makes its appearance, extending over Chili; over the whole of the country S. of the river Plata, over the islands of the Chiloe Archipelago, and Terra del Fuego. Its divisions comprise, (*a*), the Chileno (or Araucanian) Indians; (*b*), the Pampa Indians; (*c*), the Patagonians; (*d*), the Fuegians.

The range of differences in respect to physical form is wide in this group; the range of differences in respect to the geographical conditions under which they are found, being also wide; *e. g.*, there are the Andes of Chili, the level

plains of the Pampas, and the insular character of the parts about Cape Horn; not to mention the fact of South America extending farther in the direction of the Antarctic Circle than any other part of the world.

In contrast to the large areas occupied by single families, we have, in South America, as elsewhere, small districts with a multiplicity of distinct divisions and subdivisions. One of these lies in the north, on the Orinoco and Amazons, in contact with the Carib area. Hence, we find the Maypuri, the Saliva, the Achaguas, and the Ottomakas, &c. On the Uapes only, Mr Wallace enumerates the Queianas, the Tarianas, Ananas, Cobeu, Piraiarara, Pisa, Carapana, Tapura, Uaracu, Cohidias, Tacundera, Tacami, Miriti, and Omãnas. These will probably turn out to be Carib, the import of the word as a class-name being enlarged.

Surrounded more or less by the Guaranis and occupants of Brazil, come the Botocudos, Canarins, Goitacas, Machacari, Patachos, Camacans, Matali, Cacriabas, &c., &c., falling into divisions and sub-divisions. Add to these the Indians of the missions of (*a*) Moxos and (*b*) Chiquitos; the Indian of the Eastern side of the Andes (Juracares, Mocetenes, Tacanas, and Apolistas); the Indians of the Chaco, chiefly Abipoman. To this class belongs, with others, the Abiponians Proper, the Mbocobi and Toba, the Lenguas, the Payaguas, the Matagayes, the Guaycurus, perhaps the Charruas, known at present only in fragments, whole sections of it being either extinct or incorporated. The original divisions, however, were as follow:—

1. The Charruas Proper; 2, the Chagos; 3, the Chanâs; 4, the Guenoas; 5, the Martedanes; 6, Niboanes; 7, the Yaros; 8, the Minoanes; 9, the Caaiguas; 10, the Bagaez; 11, the Tapes. Of these the Chanâs and Niboanes inhabited, at the arrival of the Spaniards, the islands of the Uruguay, at the junction of the Rio Negro.

One of the most remarkable, and, at the same time, isolated, populations of South America are the

Warows.—Their occupancy is the Delta of the Orinoco, a swamp; as is a considerable portion of the sea-coast to the south of it. If it were not for the straightness of his hair, the Waraw (writes Sir Robert Schomburgh) might be taken for a negro. Doubtless he is dark-skinned, but I do not imagine that he has the negro lip. His skin is dark, and dirt gives intensity to its natural darkness; for the Waraw is uncleanly, even for an Indian. His language is certainly unintelligible to all his neighbours; neither has it been placed in the great Carib class, wide and capacious as that class is; nevertheless, it is far from being wholly isolate. It has miscellaneous affinities, and plenty of them; but the most notable characteristic of the Waraw is his industrial activity as a boat-builder. This furnishes nearly the whole of the Demerara with canoes. They are made either of the *Cedrela odorata*, or of a tree called Bisi, and are sometimes fifty feet long and six feet broad.

When a suitable tree has been found, the Waraw builds a hut in its neighbourhood, which he occupies as long as the boat is being built. The floor of the hut must be some feet above the level of the ground, and this is effected by selecting a spot where the ita-palm grows in thick clusters. This is docked to the requisite height, the root and a part of the trunk being left standing. The trunk of the maneca-tree is then cut into planks and made into a floor. Clay is laid on the floor, and a fire kept burning on the clay. The *Manicaria saccharifera* supplies the thatch.

Raleigh came in contact with the Waraws, whom he describes under the name of *Tivitivas*, adding that they fall into two divisions—the *Ciawani* and the *Arumeate;* that "they are a goodly people, and very valiant;" that, "in summer, they have houses on the ground as in other places. In winter they dwell in trees, where they build very artificial towns and houses; for between May and September the river of Orinoco riseth 30 feet upright, and then these islands are overflown 20 foot high above the level of the ground, saving some few raised grounds in the middle of them; and for this cause they are enforced to live in this manner." The undoubted peculiarities of the Waraws have been exaggerated; and they have been described as men who *live in trees*,—as *arboreal varieties* of the human species,—even as *arboreal species* of the *genus Homo.*

For South America I give D'Orbigny's classification, premising that I do not find it coincide with the divisions deduced from the comparison of the South American languages.

South American Indians.—Colour yellow, brown, or copper-red; height variable; hair thick, coarse, black, smooth and long; beard thin, coarse, black, never wavy, late in making its appearance; chin short; eyes small, deep-set; jaws prominent; teeth nearly vertical; eyebrows prominent.

1. *Primary divisions, or races (so-called)*—

A. *Ando-Peruvian.*—Colour olive-brown; stature low; forehead either depressed or but slightly vaulted; eyes horizontal, never *bridés* at their outer angle.

B. *Pampa.*—Stature often considerable; forehead vaulted; eyes sometimes *bridés* at the outer angle.

C. *Brazilio-Guarani.*—Colour yellowish; forehead not retreating; eyes oblique.

A. *Ando-Peruvians*—

a. Peruvian branch.—Colour deep olive-brown; form massive; trunk long in proportion to the limbs; forehead retreating; nose aquiline; mouth large; physiognomy sombre.—Aymara and Quichua Peruvians.

b. Antisian branch.—Colour varying from a deep olive to nearly white; form not massive; forehead not retreating; physiognomy lively, mild.—Yuracares, Mocétènès, Tacanas, Maropas, and Apolistas.

c. Araucanian branch.—Colour light-olive; form massive; trunk somewhat disproportionately long; face nearly circular; nose short and flat; lips thin; physiognomy sombre, cold.—Indians of Chili and the Chonos Archipelago. The Fuegians.

B. *Pampas*—

a. Pampa branch.—Colour deep olive-brown, or *maroon;* form herculean; forehead vaulted; face large, flat, oblong; nose short; nostrils large; mouth wide; lips large; eyes horizontal; physiognomy cold, often savage.—Indians of the Chaco and Patagonia.

b. Chiquito branch.—Colour light olive; form moderately robust; mouth moderate; lips thin; features delicate; physiognomy lively.—Indians of the Mission of Chiquitos.

c. Moxos branch.—Form robust; lips thickish; eyes not *bridés;* physiognomy mild.—The Indians of the Mission of Moxos.

C. *Brazilio-Guarani.*—A simple branch.—Colour yellowish, with a slight tinge of red; form massive; height moderate; face circular; nose short and straight; nostrils narrow; mouth moderate; lips thin; eyes oblique; eyebrows prominent; features delicate (*efféminés*); physiognomy mild.—Guarani, Caribs (?), and all the unplaced tribes of Paraguay, Brazil, the Guianas, and Venezuela (?).

From the parts about Cape Horn, we return to the western frontier of the Ugrian area, this being the frontier where European and Asiatic ethnology join.

B.

CENTRAL AND SOUTHERN EUROPEANS.

European ethnology is peculiar,—we may call it *minute ethnology.* The main divisions are known from history. So are their chief characteristics. Hence the points that command attention are certain of the finer shades of difference.

The general and leading facts that, in the case of such tribes as the Polynesian, the American, or the African, have to be collected as so many fresh points of information, are already known. As compared with Polynesia, America, or Africa, Europe is but a portion of Asia. Nevertheless its physical conditions claim consideration. No part of Europe lies between the tropics; so that the luxuriance of a spontaneous and varied vegetation, with its pernicious tendencies to incline the habits of its population to idleness, is wanting. The rank and rapid growth of the plants which serve as food to men and animals, and which dispense with labour, nowhere occurs. Few parts come under the class of steppes, or at most but imperfectly approach their character. In Asia, the vast table-lands of the centre, occupied by the Turks and Mongols, have ever been the cradle of an active, locomotive, hungry, and aggressive population. And these have ever had a strong desire to possess the more favoured areas of the south, and have conquered them accordingly. The Luneburg Heath, and parts of Russia, are the nearest resemblances to the great steppes of Mongolia and Independent Tartary; but they are on a small scale. In Russia, where the land is flat and level, the ground is also fertile, so that agriculture has been practicable, and (being practicable) has bound the occupant to the soil, instead of mounting him on fleet horses to wander with his flocks and herds from spot to spot, to become a shepherd by habit and a warrior by profession.

Europe is narrowest in its northern parts. This has had the effect of limiting those populations of the colder climes, whose scanty means of subsistence at home incline them to turn their faces southwards with the view of conquest, and supply them with numbers to effect their purpose.

Its diameter from north to south is less than its diameter from east to west. This has kept the mass of its population within a similar climate, or, if not within a similar climate, within a range of temperature far less wide than that which separates the African, the American, or the Asiatic of the northern parts of their respective continents, from the Hottentot of the Cape, the Fuegian of Cape Horn, and the Malay of the Malayan peninsula.

In no country are the great levels more broken by mountains, or the great mountains more in contiguity to considerable tracts of level country. The effect of this is to give the different characters of the mountaineer and the lowlander more opportunity of acting and re-acting on each other.

In no country are the coasts more indented. We may look in vain for such a sea-board as that of Greece elsewhere. The effect of this is to give the different characters of the sailor and landsman, the producer and the trader, more opportunity of acting and re-acting on each other.

The greatest rivers fall into seas navigable throughout the year. Contrast with this the great rivers of Asia—the Obi, the Lena, the Yenesey, and others, which for the purposes of navigation are useless, falling as they do into an Arctic sea.

Our greatest river, the Danube, runs from east to west. This ensures a homogeneous character for the population along its banks. Contrast with this the Nile, the Mississippi, and the Yenesey, in all of which the simple effect of climate creates a difference between the populations of the source and the embouchure. The great rivers of China do the same as the Danube; but the Danube differs from them, and from all other rivers running in a like direction, by emptying itself into an inland sea; a sea which gives the opportunity of communication not only with the parts north and south of the rivers which fall into it, but with those to the east of it also. The Hoang-ho and Kiang-Ku empty themselves into an ocean that, in these days of easy communication, leads to America, but which, in the infancy of the world, led to a coasting-trade only, or at most to a large island—Japan. The Baltic and Mediterranean have,—the one Africa, the other Scandinavia, to ensure their being put to the uses of trade.

Add to these the relations of south-eastern Europe to the countries watered by the Nile, the Tigris, and the Euphrates in other words, in investigating the conditions under which European civilization evolved itself, remember those of the eastern extremity of the Mediterranean.

There is another point which stands out more prominently in European ethnology than elsewhere. European history goes far back. Doing this, it tells us of great changes—changes which we may *assume* elsewhere, but which we *know* to have existed in Europe. What if these go to the extinction of some stock, group, or family? A great complication is introduced. The extinction has more meanings than one. It often means absolute obliteration. It oftener, however, means no more than the abolition of the outward and visible signs of ethnological difference. A negro marries a white. In the fourth, fifth, sixth, or seventh generation, as the case may be, his descendant is, to all intents and purposes, a white man. Yet the negro blood is not extinguished. It exists, though in a small proportion. Again, a Cornishman loses his native language and speaks English as his mother tongue. Many generations before he did this he differed from the Englishman in speech only. Is his British blood extinguished? No. The chief sign of it has been lost; that is all—so that, stocks may be obliterated, may intermix, or may lose their characteristics. To determine what existing populations are descended from the populations of the classical times, and to give to existing populations their ancestors during the same period, is a business which continually devolves upon the European ethnologist, more rarely upon the ethnologist for Asia, never upon the ethnologist for Polynesia or America.

Physically, the European populations are alike, the differences lying within narrow limits. In language the lines of demarcation are broader.

The European physiognomy is generally considered to be Caucasian as opposed to Mongolian, *i. e.* Caucasian, in the wide, Blumenbachian, and inconvenient sense of the term. And this it is in the southern and in the more cultivated parts of Central Europe. But it is by no means so generally. I do not say that truly Mongolian faces are common anywhere. I *do* say, however, that the Slavonic physiognomy approaches the Ugrian, and the Lithuanian does so still more; also that the Malay features (sub-typically Mongol) are common in the Alps, the Pyrenees, the ruder parts of Germany, Ireland, Scotland, Wales, France, and England.

The languages fall into four divisions. The first two contain two unplaced forms of speech. The third contains a form of speech which has lately been incorporated with the fourth, but only lately and only partially. The fourth contains a group of languages long and universally admitted not only to be allied, but to be closely allied:

1. *The Basks.*—Their language isolates the *Basks.* Their locality is the western Pyrenees, the north of Spain, and the south of France. Here it is where, although in the towns, like Bayonne, Pampeluna, and Bilboa, the population is French or Spanish, the country people are *Basks* or *Biscayans*—Basks or Biscayans not only in the provinces of Biscay, but in Alava, Upper Navarre, and the French districts of Labourd and Soule. Their name is Spanish (the word having originated in that of the ancient *Vascones*), and it is not the one by which they designate themselves; though, possibly, it is indirectly connected with it. The native name is derived from the root *Eusk*, which becomes *Eusk-ara* when the language, *Eusk-kerria* when the country, and *Eusk-aldunac* when the people are spoken of; so that the Bask language of the Biscayans of Bisca

is, in the vernacular tongue, the *Euskara* of the *Euskaldunac* of *Euskerria*. That the Euskara is no new tongue may be inferred from the fact of its falling into dialects, which Humboldt limits to three, whilst others extend them to five or six. The Biscayan proper is spoken in the country of the ancient Autrigones and Caristii, and it has been proposed to call it the *Autrigonian*. It has less correctly been called *Cantabrian*, and this is the name which the national taste best likes; for a descent from the indomitable Cantabrian, who so long and so successfully spurned the yoke of Rome, and who transmitted the same spirit and the same independence to the Asturian, is creditable enough to be claimed. Nor is the claim unfounded, since, in all probability, the ancient Catabria included some of the ancestors of the Euskaldunac. The Guipuscoan is the western Biscayan. The Laburtanian is the Euskarian of France, spoken in the parts about St Jean de Luz; and which, in the district of Soule, is supposed to fall into a sub-dialect. Even as the mother-tongue of the present Welsh was, originally, the language of the whole of Britain, so was the mother-tongue of the present Bask the language of the whole of the Spanish peninsula. The generic name for this is *Iberian*, so that, assuming a certain amount of intermixture between the invading Romans and the aboriginal inhabitants, the present Spaniard, though Latin in speech, is, more or less, *Iberian* in blood. So are the south-western French, inasmuch as the old Iberian reached the Garonne, perhaps the Loire.

2. *The Skipetar* or *Albanians*.—Their language isolates them, though many hold that it can be connected with those of the fourth class. Albania is their occupancy. The testimony of travellers to their belonging to the fair-complexioned and grey-eyed populations is pretty general, although Skene gives the Mirdite tribe a swarthy skin and black eyes. The evidence, too, as to their bulk and stature varies; some writers giving them spare, light, and tall forms, others making them shorter and more square-built than the Greek. That the eye has less animation, and the countenance less vivacity (in other words, that the Albanian is heavy featured as compared with his quick-witted neighbours) is certain. Both the men and women are hardy, and expose their bodies freely to the atmosphere, accustoming themselves to an out-door life amongst their flocks and herds, and dwelling, when in-doors in rude huts. Like the Swiss, they willingly let out their valour and hardihood in military service; and the best and most unscrupulous soldiers of the Sultan are those recruits, who, partly by force, partly by pay, are brought from Albania. Hence we find Albanians far beyond the pale of Albania; in Greece, in Thrace, in Asiatic Turkey, in Egypt, and even in Persia. The tribes too, amongst themselves, indulge in the right of private quarrel, rarely rising to the dignity of warfare, but more like the old border feuds between England and Scotland. Some of the Skipetar are Mohammedans, some Roman Catholics, some Christians of the Greek church. These are the modern representatives of the ancient Illyrians. Skipetar blood must be found far south of the present Skipetar area, even as Bask (Iberic) blood is to be found in the non-Iberic parts of Spain and Portugal and France.

3. *The Kelts*.—By raising the value of the class called Indo-European, a class based upon philological rather than physical grounds (for which see Notes on LANGUAGE), the Kelts (= the Welsh, Bretons, Gaels, and Manxmen) can be placed in the same division with the

4. *Sarmatians, Germans, Latins, and Greeks*, who are Indo-European (*q. v.*) in the strictest sense of the term. *Sarmatian* means *Slavonic* and *Lithuanic* collectively. The great historical nations of Europe belong to this class. For the relations of the speakers of the Sanskrit language see LANGUAGE (*Notes*).

C.

AFRICANS AND SOUTH-WESTERN ASIATICS.

A return to the south-western parts of Asia leads us to the ethnology of Africa, which begins in Syria and Mesopotamia; the populations akin to the Arab being (in the opinion of the present writer at least) African rather than Asiatic; at any rate, transitional or intermediate.

The populations speaking languages akin to those of the Bible and Koran (the Hebrew and the Arabic) are termed

A. *Semitic*.—This group contains,

In Asia, the Syrians, Assyrians, Babylonians, Phœnicians, Ammonites, Moabites, Ishmaelites, Edomites, Samaritans, Jews, along with their colonies, &c., of antiquity; of modern populations, the Arabs, the Jews, the Kaldani (of Kurdistan), the Arabs, &c.

In Africa, the Abyssinians of the province of Tigré (*Christian*), the Abyssinians speaking the Amharic language (*Christian*), the Gafat Abyssinians (*pagan*).

Sufficiently akin to these to have become called *Sub-Semitic* are the Amazirgh or Berber, and Copt or Ægyptian, tribes. With the modern Copts the hair is black, crisp, or curled; the cheek-bones prominent; the lips thick; the nose somewhat depressed, nostrils wide; complexion brown or yellowish; eyes oblique (?); frame fleshy; physiognomy heavy.

With some of the Berbers—*e. g.*, the Tuariks of Wadreag—the hair and skin are nearly the hair and skin of the negro. With others—the Amazirgh of the ancient Mons Aurasius—the complexion is so light as to have engendered the doctrine that they are descended from the Europeans who, under Genseric, sacked Carthage.

We approach the negro types in the division for which the name

B. *Nilotic* is suggested, its area being the drainage of the Upper and Middle Nile. Of the four chief Nilotic groups (1 and 2), the Nubians and Bishari approach the Copts, (3) the Agows, the Abyssinians, (4) the Gallas having both Semitic and Kafre characteristics. The colour is often brown rather than black, the frame spare, the nose straight or aquiline, lips moderate, hair long. In respect to language the Agow dialects are Sub-Semitic. Hence, whilst the Semitic populations are extreme—*i. e.*, Asiatic or European rather than negro—the Nilotic are transitional. Several of the Nubian tribes are truly negro, at least the languages of Kordofan and Darfur belong to this class. For the philological import of the term *Semitic* see LANGUAGE (*Notes*); also for that of

C. *Kafre*, the name of the next group.

The Kafre area extends from the parts north of the equator to the Hottentot frontier, and that on both sides of the continent; the tribes of the higher levels and the more southern areas departing furthest from the negro type; those of the coast, the alluvial tracts, and the parts nearest the equator approaching it the closest. In many cases the Kafre physiognomy is absolutely negro. The *eastern* Kafres, of Mozambique, Zanzibar, &c., are conterminous with the southern Gallas; the *southern*—those of the Cape—with the Hottentots and European colonists; the *western*—of Benguela, Angola, Loango, &c.—with the negroes of the parts between the Niger and the Gaboon, members of a class pre-eminently, but not exclusively, nor yet to the exclusion of other classes.

D. *Negro*.—Skin black, hair woolly, lips thick, nose depressed, jaw protruded, forehead retiring, proportions of the extremities abnormal. Such is the extreme type. Add to this that the civilization is low, and the area chiefly consists of lowlands, coasts, and the deltas of rivers, rather than of elevated plateaux or mountain ranges. When the occupancies are of this latter kind the physiognomy approaches that of the Semitidæ, the language in many cases being negro, or like that of the nearest tribes.

With the negro branch of the African division it is convenient to begin with the part where the black tribes touch the south-western Amazirghs and Moors. This means the parts about the Senegal.

The Wolofs.—Skin black, conformation negro, religion pagan rather than Mohammedan. Large portion of their area the valley of the Senegal.

The Mandingos.—Less dark than the Wolofs, negro, original paganism largely replaced by Mohammedanism. Large portion of their area the valley of the Gambia.

The Fulahs.—Skin brown rather than black, form less negro and more Arab than that of the Mandingos and Wolofs, creed largely Mohammedan. Area elevated, the watershed between the Gambia and Senegal.

With all these populations the civilization is comparatively high.

The languages unequivocally related to the Mandingo extend as far south and east as the Ivory Coast; for the strip which extends along the sea from Cape Mount to Cape Palmas, and which is occupied by tribes akin to the Krumen, we (after several doubts) subordinate to the Mandingo area, or rather we make both the Kru and Mandingo group members of the same large class. On the other hand, a portion at least of the Kong range is Mandingo; indeed, the extremity of this area reaches the Ashanti frontier inland, and the Fanti frontier on the Gold Coast; these two names belonging to one and the same class, a class conveniently called

Inta.—To this belong the Booroom, Aowin, Amanahea, Affutu, Ahanta, and Odzhi forms of speech. Mohammedanism decreasing, fetichism predominant.

The Gha or Akra, occupants of the parts about Cape Coast Castle, speak a language said to be unintelligible to the Fanti, but with numerous Fanti, as well as other affinities.

The Dahomey tribes occupy the *Slave Coast;*

The Benin, or Moko, the delta of the Niger along with

The Ibos.—These are all subdivisions of some single group of unascertained but no very high value. The influences of Mohammedanism are here at the *minimum;* snake worship and human sacrifices being common; circumcision being common also. The *Bonny* tribes form a division of this class.

The Mahas, who reach as far inland as the Kong range, are Dahomey tribes.

At the back of the Benin and Ibo countries inland, lie three allied groups—allied also to the groups just enumerated—viz.:—

The Yorruba (*or Aku*), *the Kouri, and the Tapua* (*or Nufi*).—The Yorruba and Tapua populations lead to those of the interior.

In the parts about the *Old* Calabar river the type (of *language* at least) is considered to change. Such being the case, we may return to the Wolof area, and go over some portions of the ground again for the sake of certain *minutiæ* which the *general* sketch hitherto given has prevented us from noticing.

The three great classes of the Wolofs, Fulahs, and Mandingos, by no means exhaust the populations between the Senegal and Cape Mount. About Cape Verde, surrounded by Wolofs, lie the Sereres. Further inland, separated from the Sereres by Wolofs, and in contact with both Fulahs and Mandingos, lie the Serawolli. The languages of each of these divisions have miscellaneous affinities with each other, and the three leading tongues just named. Perhaps, they are most like each other, next like the Fulah and Wolof, least like the Mandingo.

From the Casamança to the Sherbro, the languages of the coast are all *other than* Mandingo, Fulah, or Wolof Proper. They differ, too, from each other. Some have been subordinated to other groups, though only by certain writers. The general phenomenon is the appearance of several mutually unintelligible and by no means visibly allied tongues within a comparatively small area; these being —*The Felúp*, the *Banyon*, the *Papel*, the *Balantes*, the *Biafares*, the *Bissago Islanders*, the *Nalu* and the *Sapi*, the languages akin to the *Timmani* and *Bullom*, south of which the Mandingo group shows itself on the coast.

Again,—east of Cape Palmas we have the imperfectly known languages of the Ivory Coast, with miscellaneous affinities to the Mandingo, Fanti, &c.

Amongst the tribes thus enumerated the Fulahs stand most by themselves in physical form, being brown rather than black. In civilization the Mohammedan Mandingos equal them. In natural vigour and spirit the Wolofs and Krumen are honourably distinguished. Fetichism and slave-dealing take their worst forms in Dahomey. For simple rudeness of habits the Felúps and the smaller sections like them are most conspicuous. Laying language (which will be considered elsewhere[1]) out of the question, the chief objection to throwing all these into one large group lies in the physical peculiarities of the Fulahs. We must note, however, the extent to which it coincides with certain physical conditions, and remember that we have met it under similar conditions elsewhere, *i. e.* in Abyssinia. The reasons for not carrying this class further south, lie in certain points of language also considered elsewhere. Arguing from the direction in which the leading populations seem to have spread themselves, we may, in a somewhat bold attempt to reconstruct the original *situs* of the northern section of this great western group, not unreasonably hold—that the Sereres, Serawolli, and the minor populations, like the Felúp, &c., are *in situ;* the Wolofs, Mandingos, and Fulahs, that most indent their areas, being intrusive; the first having spread from the Lower Senegal, the second from the Upper or Middle Senegal, the third from the Upper Gambia and the parts south of it. The Timmani seem to have encroached from the north, the Gha from the interior; the Ashanti having also effected large displacements. The Mohammedan Africans use, though sparingly, the Arabic alphabet—the Mandingos being, perhaps, the best scribes and scholars. The Vei (a division of the stock) have a syllabic alphabet of their own, invented by a native lately dead, Doala Bukara. He had seen both Arabic Korans and English Bibles, so that the idea of *writing* sounds was one with which he was acquainted.

South of the Berber and east of the Fulah, Mandingo, Jorruba, and Tapua areas, come the inland populations of the northern tropic, some of the extreme negro type, rude, and wild, and others only subtypically negro, and modified by Mohammedanism. The chief divisions here are philological; the physical differences lying within narrow limits. Neither does anything but language separate them from the western tribes. On the other hand, there are great gaps in the geography.

The *Haussa*, *Timbuctu*, *Adamowa*, *Bornu*, *Begharmi*, *Mandara*, *Mobba*, *Furian* (*Darfurian*), and *Koldagi* (*Kordovan*) groups, of unascertained value, and chiefly philological, lead us across the drainage of the Lake Tshad to that of the Nile, where the phenomena of the Gambia repeat themselves in a very marked manner. There are the analogues of the Fulahs in the mountain districts and plateaux of Abyssinia, those of the Wolofs, Mandingos, and smaller tribes like the Felúp on the alluvial soils. The negroes are chiefly those of the Kordofan frontier, of Sennaar, and of the lower level of Abyssinia—*Shelluk*, *Denka*, *Tumali*, *Shabún*, *Fertit*, *Qamamyl*, *Dalla*, *Doba*, *Gonga*, &c. In Abyssinia some of the languages are decidedly Semitic, *e. g.* Gheez, others Sub-Semitic, as the Agow, with transitional or intermediate forms. In the elevated table-lands

[1] See *Notes* on LANGUAGE.

the skin is brown rather than black, and the features Arab or Persian rather than negro. There are are also features comparatively Arab or Persian, with black complexions. An early Christianity, as well as Mohammedanism, has taken root in Abyssinia. The *Galla*, *Nubian*, and *Bishari* divisions (of unascertained value) give us notable deviations from the extreme negro type—the hair being long, the nose often curved, the face elongated.

On the east coast there is a certain number of tribes yet to be accurately distributed between the Kafre and the Abyssinian stocks, just as on the west there are (in the parts about the Old Calabar river) some similar tribes whose relations to the populations north and south of them are equivocal.

The last division of the African stock are—

E. *The Hottentot.*—With the extreme varieties of this division the physical conformation departs widely from even the negro standard. The stature is low, limbs slight, cheek bones prominent, zygomatic arches bent outwards (giving a Mongoloeid form to the face), hair in tufts, eyes oblique. In the female organs of generation the nymphæ are sometimes enormously developed—the buttocks being steatomatous. The pelvis exhibits a *maximum* difference according as it is male or female—the male being strong and dense, the female light. In both cases the diploe between the bony plates is small in amount, the ossa ilii vertical, the sacrum narrow, the conjugate diameter short. The neck of the thigh bone is short, with an oblique direction. Such, at least, are the results of the researches of Vrolik. The cranium is dolichocephalic, *i. e.*, according to the terminology of Retzius, more remarkable for its fore-and-aft than for its side-to-side diameter. In this it is African rather than Mongol—it being Africa and Mongolia that supply the two extreme forms of the dolichocephalic and brachycephalic cranium. The language contains more than one inarticulate sound, described as the *click*.

The general habits of the Hottentot family are pastoral; the inferior members of it, the Saabs or Bushmen of the *Karroo* country being hunters—in many cases in the still lower condition of the Australian. The Hottentot has a better claim to be considered as a separate species of the genus *Homo* than any other section of our kind. Further remarks on this statement will be found in Language (*Notes*). All that will be done at present will consist in a short notice of the two extremes of the group. The *Saabs* are the lowest in civilization and the smallest in size, their country being the district between the Roggeveld and the middle part of the Orange River—the most unfavoured spot, perhaps, in Africa. Their skin is tawny rather than black, their language either wholly or nearly unintelligible to the Hottentots. The Korana Hottentots continually encroach on them, and hunt them down like beasts. Of the Hottentots of the Cape frontier the Koranas are the best-looking. Their claims, however, to stand as the models of the family are modified by the recent researches of Galton in the parts east of Walvisch Bay, and the explorers of Lake Ngami. The Hottentot tribes reach thus far north, where they are the equals, and, in some cases, the superiors of the Kafre populations in frame and daring. On the other hand, where the external conditions of aliment, security, and freedom are unfavourable, there is a visible degeneracy. The same has been remarked at the Cape. According to Mr Thompson, a division of the Koranas, who lost their herds, rapidly approached the Bushman type. The Griquas are a mixed breed—Dutch and Hottentot.

Such is the classification which, in the opinion of the present writer, best represents the divisions of the human species. He is well aware that the value of the classes is unequal, and that the nomenclature is imperfect. On the other hand, he believes that both the arrangement and the phraseology are sufficient for all questions likely to arise out of our present *data*, and also that they give a good groundwork for future investigations. That they are based upon a certain amount of assumption is clear—in other words, they are more or less hypothetical. In the eyes of several respectable authorities, they assume the chief point in question, viz., the specific unity of *man*, and the division of the species constituted by the men of present and past times into varieties and sub-varieties. What if all these varieties be species, and the species a genus? To this objection the writer will forthwith address himself—premising his remarks by an explanation of the point of view from which he has taken the preceding outline.

1. That all the languages of the earth's surface have had either one common origin, or else been, one and all, largely modified by some single language, he is convinced; due allowance having been made for a large amount of similarity independent of any ethnological connection. This means that a large number of words in different languages will be like each other, not because two or more tongues lent or borrowed certain words, nor yet because they all came from a common mother tongue, but because the human organism, under certain conditions, acts according to certain laws.

2. The similarity between languages, which is not thus explained, is held to be *primâ facie* of a common descent on the part of those members of the human kind that speak them—*primâ facie* evidence, and that of a strong sort.

3. That this *primâ facie* evidence will *not* be over-ridden by the conflicting phenomena of physical and moral differences is the writer's *impression*, an impression that has been forced upon him less by the small amount of such differences (for he freely admits that, with the ordinary interpretation of the term, they are in some cases *specific*), than by the extent to which they may be referred to certain physical and other influences. That these effect *something* is admitted by all who have written on the subject. That they effect more than any single supporter of the multiplicity of the species of the genus *Homo* has recognised, is certain—at any rate we may seek in vain for the naturalist who has taken in half the complications of the question. Thus—

That the physical characters of our kind are permanent, is argued from such a fact as the mummies of ancient Egypt giving us the same organization that is given by the modern Copts. Why should they not? The country in which they occur is as truly the valley of a certain river, between a certain degree of latitude, now as ever. The only facts on this question that are other than irrelevant are those that show that 2000 years under a *change* of climates go for nothing.

Again—that comparatively light complexions are found in some of the hottest parts of the world, whereas dark ones are found in comparatively cool ones, passes for an argument against the effects of heat on the skin. It only shows that heat is not the *only* cause of an increased secretion of the epidermic colouring matter.

Moisture—light—altitude—what has been done, worthy of the name of science, in the investigation of these influences—even singly? Next to nothing. Let it be granted that a little is known about the acclimatization of new-comers in fresh habitats. The process by which a world is peopled by the gradual diffusion of a given population from the circumference of an ever-increasing circle, has never been imitated, and never will be.

Then there is the question of descent. That two localities, one in Africa, and the other in South America, may so closely resemble each in their physical conditions of heat, light, altitude, moisture, land-and-water relations, as, for the purposes connected with the modification of the human organism, to be considered as identical, is highly probable. What, however, if the human organisms thereof notably differ? Not the inference that physical conditions either act irregularly, or not at all, but that the objects on which

they acted in cases under notice were different. The negro that from (say) Central Asia reaches the Lower Niger is the descendant of ancestors whose organizations were acted upon by the physical influences of a line drawn through south-western Asia and north-eastern Africa, whilst the Indian of the Lower Amazons is the descendant of ancestors whose organizations were acted upon by the physical influences of a line drawn through Siberia, the Arctic Circle, North America, Central America, and the north-western parts of South America.

The phenomenon of transitional and intermediate forms has again been greatly neglected by the advocates of the doctrines under notice.

However, as all this and a great deal more may be worked out with greater care than has hitherto been applied, the doctrine that the species of mankind are numerous is still an open question. Even if what we call the *dynamic* question (the question as to the power of external influences) be settled in favour of the unity of man, there will still be many plausible objections that a little ingenuity may discover. To say nothing about the extent to which the ordinary naturalist views of species may be modified, the value of language as an instrument of classification would be materially altered by any facts which might lead us to believe in the existence of a species of our kind, originally destitute of language, but not destitute of the capability of learning it when heard from others. Again, the value of transitional or intermediate forms as connecting links between extreme types depends greatly upon the character of the facts connected with hybridism and intermixture.

At present, however, we may be satisfied with the doctrines lately laid down, viz.:—

1. That, as a matter of fact, the languages of the earth's surface are referable to one common origin.

2. That, as a matter of logic, this common origin of language is *primâ facie* evidence of a common origin for those who speak it.

For the purposes of exposition, and even for those of investigation, the speculative question as to the unity or non-unity of our species is of far less importance than it seems to be. With ethnology, as with other studies, the bulk of its ordinary results are but slightly affected by the hypotheses that apply to the remoter and more abstruse questions of its obscurer departments. Even if we multiply species to the utmost, the unity classification gives us something. It tells us how language spread, even if it fails to tell us that the populations who spoke that language were specifically the same. Or, if we account for the phenomena of transitional and intermediate forms by the doctrine of hybridism and intermixture, the elements of this hybridism and intermixture are indicated. On the other hand, however, there are grave differences between the classes of the two systems. As long as the species is single our questions are questions of *descent*. Where, however, we have several species, *descent* is out of the question, and the likest groups are those that have the most points of resemblance. Upon the whole, however, the two views give us liker results than we expect *à priori*. This is because the arrangement of *varieties* closely approaches the arrangement of *species*.

To understand this, lay out of the question the islands of the earth's surface, and ask how an ethnologist upholding the unity of our species would people the world. He deduces his population from some point more or less central. His area, being continental, is *continuous*, and he supposes the stream of population by which its several portions were occupied to have been *continuous* also. The spread is that of circles on a still piece of water. Now, if so, *all changes must have been gradual, and all extreme forms must have passed into each other by means of a series of transitional ones.*

It is clear that such forms, when submitted to arrangement and classification, will not come out in any definite and well-marked groups like the groups that constitute what is currently called species. On the contrary, they will run into each other, with equivocal points of contact, and indistinct lines of demarcation; so that discrimination will be difficult, if not impracticable. If practicable, however, it will be effected by having recourse to certain typical forms, around which such as approximate most closely can most accurately and conveniently be grouped. When this is done, the more distant outliers will be distributed over the debatable ground of an equivocal frontier. In short, varieties as opposed to species imply transitional forms, whilst transitional forms preclude definite lines of demarcation.

Yet what is the actual classification of the varieties of mankind, and what is the current nomenclature? To say the least, it is very like that of a collection of species. Blumenbach's *Mongolian*, Blumenbach's *Caucasian*, Blumenbach's *Æthiopian*, are all terms that suit the nomenclature of the naturalist of *genera*. Nevertheless, however much it may give us of broad and trenchant lines of demarcation between varieties which (*ex vi termini*) ought to graduate into each other, it is far from being indefensible.

Man conquers man, and occupant displaces occupant on the earth's surface. By this means forms and varieties which once existed become extinct. The more this extinction takes place, the greater is the obliteration of those transitional and intermediate forms which connect extreme types; and the greater this obliteration, the stronger the lines of demarcation between geographically contiguous families. Hence a variational modification of a group of individuals simulates a difference of species; forms which were once wide apart being brought into juxtaposition by means of the annihilation of the intervening transitions. Hence what we of the nineteenth century—ethnologists, politicians, naturalists, and the like—behold in the way of groups, classes, tribes, families, &c., is beholden to a great extent under the guise of *species;* although they may not be so in reality, and although they might not have been so had we been witnesses to that earlier condition of things when one variety graduated into another and the integrity of the chain of likeness was intact.

A group is sharply defined simply because we know it in its state of definitude; a state of definitude which has been brought about by a displacement and obliteration of transitional forms. An ethnologist, then, may think with advocates of the unity of mankind, and employ the nomenclature of their opponents; in other words, the chief groups into which mankind is distributed are much the same in their relations to each other, whatever may be the opinion as to their absolute value and importance.

The last point to which the attention of the advocate of the plurality of the human species is directed is that of time, it being clear that in any estimation of the effect of physical and other causes upon the human organism, the *duration* of their action is an all-important element. The changes that ten generations fail to effect may be effected by ten times ten. Now, it is too often assumed, that because an investigator supports the origin of mankind from a single pair, he also supports the recent origin of that pair, and by so doing, limits the duration of the forces by which he supposes the existing differences to have been effected to a historical instead of a geological period. The two doctrines, however, by no means necessarily go together.

The consideration of the amount of change that external and other causes *have* effected, leads to the consideration of the changes that are likely to be effected hereafter, to questions as to the acclimatization of colonies in foreign parts, the fitness of the whiter varieties of our kind for the tropics, the fitness of the darker varieties of our kind for the colder portions of the earth's surface, and a long range of similar investigations. Whether, and under what conditions, an

Englishman can become a permanent occupant of such countries as Brazil or India, is a truly ethnological problem, and also one of no mean importance. Akin to this is the valuation of the effects of civilization, and the moral influences that it engenders.

Hence, the chief ethnological problems, generally expressed, are those of (1.) the unity (or non-unity); (2.) the geographical origin (or origins); (3.) the antiquity; and (4.) the futurity of mankind—questions all closely connected with each other, and all mutually illustrative of each other—questions to which the phenomena of classification and the several ethnological methods are subordinate. In the extent to which the whole subject is new, we get the measure of the amount of thought and research requisite for even an approximation to any legitimate ethnological hypothesis upon these large and complicated questions. (R. G. L.)

ETIENNE, St, a large manufacturing town of France, capital of a cognominal arrondissement, in the department of Loire, stands on the Furens, a small affluent of the Loire, 32 miles S.W. of Lyons. Pop. (1851) 53,741. St Etienne is indebted for its rapid rise and present importance chiefly to its being situated in one of the most productive coal fields of France. It likewise derives considerable advantage from the Furens, which furnishes water-power for its machinery. The chief manufactures are fire-arms and silk ribands. About 30,000 or 40,000 stand of arms are made here annually, besides about 30,000 fowling-pieces and 1500 pair of pistols. The ribands are unrivalled for richness of colour and beauty of pattern, and are exported to all parts of the world. The annual value of those manufactured here is estimated at 45,000,000 francs. The other manufactures are bayonets and cutlery, files, nails, anvils, and other iron and steel goods. St Etienne is connected by railways with Lyons and Roanne; whence, by means of the Rhone and Loire, the coal and other products find easy access to all parts of France. The town is irregularly built, but the modern part of it has some wide streets and spacious squares. The houses are built of fine white sandstone, which is soon tarnished and blackened by the smoke of the town. It is the seat of tribunals of primary instance and commerce, and has an ancient cathedral, a town-house, exchange, theatre, a handsome obelisk fountain, museum of local manufactures, national college, public library, council of prud'hommes, deaf-mute institution, and a mining school.

ETIQUETTE (Fr. *étiquette*, a ticket or label affixed to a bag or bundle of papers) originally signified an account of ceremonies. In modern usage etiquette denotes the ceremonial code of polite life, or those forms which are observed towards particular persons, especially in courts, at levees, and on public occasions. The original sense of the word points to the custom of delivering cards containing orders for regulating ceremonies on public occasions.

ETON, a town of Buckinghamshire, on the left bank of the Thames, 21 miles W. of London. It is connected with Windsor, on the opposite bank of the river, by a neat cast-iron bridge, erected in 1824. Eton is chiefly celebrated for its college, founded by Henry VI. in 1440. This establishment consists of a provost, vice-provost, 6 fellows, a head master, under master, 70 king's scholars, 7 lay clerks, and 10 choristers, besides inferior officers and servants. The scholars must be born in England, of lawfully married parents, and be between eight and sixteeen years of age. A number of the head boys are annually nominated to King's College, Cambridge. On their removal to Cambridge they are received on the foundation and maintained out of its endowments, and after three years they succeed to fellowships. There are also two scholarships at Oxford for foundation scholars. Failing an appointment to either university at the age of seventeen, they are superannuated at eighteen or nineteen; and for such there are a few exhibitions in the gift of the college. The scholars are lodged and boarded by the establishment, and by statute their education should be gratis, but a sum of L.6 or L.7 is now charged for their instruction. The degrading system of "fagging," by which the boys of the lower schools are made servants or fags to those of the upper, is still in force here. Besides the scholars on the foundation, Eton College is attended by about 600 scholars who reside in private houses, and are styled *oppidans*. Many of these are sons of persons of rank and fortune. The total expenses of a boy educated as an *oppidan* may average from L.150 to L.200 a-year. The course of instruction is almost wholly classical; and though there are masters for French, German, arithmetic, writing, &c., these branches are unconnected with the general business of the school, and are attended at extra hours. Among the celebrated men who were educated at Eton, may be mentioned Sir Robert Walpole; Harley, Earl of Oxford; Lord Bolingbroke; Earl Camden; the famous Earl of Chatham; the Hon. Robert Boyle; Lord Lyttelton; Gray; Horace Walpole; West; Waller; Fox; Canning; the Marquis of Wellesley; Hallam the historian; and the Duke of Wellington. The singular custom termed the *montem*, which was observed here triennally on Whit Tuesday, has now been abolished. The last celebration of it took place in 1844. It consisted of a procession of the boys in a kind of military order, with flags and music, headed by their "captain," to a small mount called Salt Hill, near the Bath road, where they levied contributions, or "*salt*," from the passers-by and spectators. The sum collected sometimes exceeded L.1000; the surplus, after deducting certain expenses, becoming the property of the "captain" of the school. The college buildings consist of two quadrangles, built partly of freestone but chiefly of brick. The outer quadrangle or school-yard is inclosed by the chapel, schools, dormitories, and masters' chambers, and has in its centre a bronze statue of the royal founder. The buildings inclosing the inner or lesser quadrangle contain the residences of the fellows, the library, hall, and various offices. Between these are the provost's lodge, &c.; appertaining to which is an ancient tower and a gateway in the centre, connecting the two courts. The chapel, on the south side of the outer court, is a fine Gothic edifice, containing some interesting monuments, among which is one to Sir Henry Wotton, who was long provost of the college; and at the west end of the ante-chapel is a fine marble statue of the founder in his royal robes, by Bacon. The library contains a curious and valuable collection of books, a collection of Oriental and Egyptian manuscripts, and some beautifully illuminated missals. The parish church having fallen into decay, the college chapel was used as a substitute; but a handsome church, in the early English style, has recently been erected, at a cost of about L.8000. Pop. of parish (1851) 3666, besides 130 in Eton College.

ETRURIA, an ancient province or country of Italy, bounded on the N. by Liguria, from which it was separated by the river Macra, now Magra; on the side of Cisalpine Gaul, by the lofty ridges of the Apennines; on the E. by Umbria, from which it was separated by the river Tiber; and on the W. by the Tuscan Sea. The country thus situated appears to have been one of the earliest seats of European civilization, and the principal source whence Rome derived her laws, customs, and superstitions.

ETRUSCANS, or TUSCANS, called by the Greeks *Tyrrhenians* or *Tyrsenians*, and by themselves *Rasena*, were the people who inhabited ancient Etruria, and who, at a period when the rest of Europe was immerged in ignorance and barbarism, had attained to a high degree of civil and social refinement.

Etruscans.

The origin of this interesting race, from whom have descended some monuments of the earliest humanity, appears to have puzzled the ancients as much as it has perplexed the moderns; and, notwithstanding all that has been written on the subject, particularly by the Italian antiquaries, it is still beset with difficulties and involved in obscurity. The question chiefly agitated amongst the ancients was whether the Etruscans were Pelasgi from Greece, Lydians from Asia Minor, or an indigenous and aboriginal race in Italy; and the moderns have added more than an equal number to the hypotheses of the ancients. Herodotus represents them as a colony of Lydians, who, having been compelled by famine to emigrate from Asia, arrived, after various wanderings, in Umbria, where they settled and called themselves Tyrrhenians, from Tyrrhenus, son of their king Atys, the conductor of the emigration. This tradition, whencesoever derived, has been almost implicitly followed by the ancient writers; indeed Cicero, Strabo, Velleius Paterculus, Seneca, Pliny, and Plutarch, all agree in repeating the assertion that the Etruscans originally came from Lydia.

But the moderns have not in general evinced the same deference for the authority of Herodotus in this particular, and have advanced a variety of hypotheses, some of them, perhaps, not much more tenable nor better founded than the story told by the father of history. Dempster, who may be said to have laid the foundation of an accurate knowledge of Etruscan history and antiquities, is of opinion that there existed an original nucleus of inhabitants in Etruria, which was successively augmented by the Lydian immigration, and by Pelasgic colonies from Thessaly and Arcadia. Bochart coincides pretty nearly with Dempster, but maintains that there must have existed a direct intercourse between the Etruscans and Phœnicians, as many of the fables, superstitions, customs, and monuments of the former were, according to him, of oriental origin. Winckelman and the Count de Caylus, admitting an ancient communication with the East by means of the Mediterranean, substitute Egypt for Phœnicia; and to the supposed intercourse between Etruria and the land of the Pharaohs the former ascribes the remarkable progress made by the Etruscans in the sciences and liberal arts; whilst the latter is of opinion that this people borrowed every thing from Egypt, and that the origin of science and art in Etruria is coeval with the commencement of their commercial connection with that country. Improving upon these views, some writers have advanced a step further, and maintained that the Etruscans not merely carried on an intercourse with Egypt, but were actually of Egyptian descent, in fact a colony or branch of the great nation established in the Delta and valley of the Nile. This opinion has been adopted by Buonarotti, Gorius, Mazzochi, Maffei, Guarnacci, and Lord Monboddo; but it has been strenuously opposed by a number of the most learned Italian, French, and German archæologists, particularly by Bardetti, Pelloutier, Fréret, Funccius, Adelung, and Heyne, who, though differing from one another in some points, have generally contended for the northern and Celtic origin of the Etruscans. Lanzi, without pretending to investigate the origin of this remarkable people (who, he nevertheless seems to think, were Lydians, augmented at different times by the accession of Pelasgic tribes), endeavours to prove that, whatever may have been their descent, the language, religion, learning, and arts of the Etruscans, were of Greek origin; that the period of their greatest perfection in the arts of design was posterior to the subjugation of Etruria by the Romans, when the intercourse with Greece had rendered them familiar with the beautiful models of that country; and that, even admitting all languages to have been originally derived from the East, and many Greek words to have sprung from Hebrew or Phœnician roots, still there exist in the Etruscan such evident traces of Hellenic descent, particularly in the names of gods and heroes, as to render it almost impossible to derive their origin from any other source. Further, in support of this theory, the learned Italian attempts to show from the inscriptions on the Eugubine tables, that the Etruscan was Æolic Greek, without either the monosyllabic characteristics of the northern dialects, or the prefixes and affixes peculiar to most of the oriental languages. Humboldt, again, supposes this people to have been a connecting link between the Iberians and Latins, or a sort of transplanted offset from the great Celtic stem. But the learned and ingenious Müller adopts an intermediate opinion. Admitting a primitive population of Etruria, as to whose origin he does not venture to decide, he conceives that there are nevertheless grounds for assuming that they became intermingled with Pelasgic colonists from the coast of Lydia, where the latter had for a time settled, and acquired the name which they afterwards rendered notorious by their piracies in the Ægean Sea. It would be hopeless to endeavour to reconcile these conflicting hypotheses, and endless to examine their respective merits in detail.

Of all those, however, who have laboured to resolve this *quæstio vexata* in the archæology of history, Niebuhr has, we think, been, upon the whole, the most successful. The origin of the erroneous opinions as to the extraction of the Etruscans, he traces to two assumptions, which he shows to be equally fallacious: first, that the Pelasgians could only be derived from Greece, a supposition which probably gave rise to the story of the migration from Thessaly; and, secondly, that because the Mæonians were Tyrrhenians, these Tyrrhenians, like those of Lemnos, were of the same stock with the ancient inhabitants of Agylla and Tarquinii, whence arose the story of the Lydian emigration of the ancient Tyrrhenians, as told by Herodotus. But, on the authority of Xanthus, Dionysius proves that the account of Herodotus was not founded upon a Lydian tradition; and, from the complete difference of the two nations in language, usages, and religion, he justly contends that it would deserve no credit, even if there had been a tradition to the effect stated. He asserts that the Etruscans spoke a language which bore no affinity to any other known form of speech; and this assertion would deserve full credit, even if we had only the evidence of Dionysius, inasmuch as Etruscan was then, and for a considerable time afterwards, a living language, in which, as we gather from Lucretius,[1] books were written and read. It is further confirmed by the inscriptions still extant, in which every resource of etymology has failed to detect any analogy between the Etruscan and the Greek language or the kindred branch of the Latin; and these singular monuments, which have thus resisted the utmost efforts of modern scholarship and ingenuity, will to all appearance remain for ever a dead treasure, unless a key shall accidentally be furnished for their interpretation, by the discovery of a bilingual inscription. In opposition to the unanimous evidence of the ancients, who distinguish the Etruscan from the Sabine and Oscan, it has indeed been maintained that all the nations of Italy, remains of whose language occur in inscriptions, spoke only dialects of the

[1] Non Tyrrhena retro volventem carmina frustra
Indicia occultæ Divûm percurrere mentis.

same radical form of speech; but this opinion, which has chiefly prevailed amongst the Italian scholars, is at variance with the results of unbiassed investigation; and it appears to have been completely established that the Etruscan language, being wholly original and peculiar, bore as little affinity to the Sabine and Oscan as to the Latin and Greek, with which fanciful etymologists have vainly sought to connect it.[1]

The Etruscans, during the most prosperous period of their history, inhabited Etruria proper, and the country about the Po, besides distant colonies. The Rætians and other Alpine tribes were also of Etruscan origin; and so were the Lepontians and Camunians, perhaps also the Euganeans, who inhabited Venetia before the founding of Patavium. It has been suggested by Niebuhr that the language spoken by the people of Groeden in the Tyrol, a language which seems to stand alone in its peculiar roots, may have some claims to be considered as a relic of the ancient Etruscan.[2] The Brenner formed the northern boundary of the Rætians, and consequently of the Etruscan race, who in the time of their greatness had probably occupied the mountains as a bulwark against irruptions from the north. Some, however, are of opinion that Rætia was the original home whence the Etruscan people issued, and spread first in Upper Italy, and afterwards across the Apennines; and the harshness of the Etruscan language, which seems still to survive in the Florentine pronunciation, has been adduced as an argument for the Alpine origin of the people.

In the ancient history of the Umbrians it was related that the Etruscans had conquered three hundred towns of their nation. The Umbrians, therefore, must have once occupied the greater part of the countries, including Tuscany, which the Etruscans possessed in the zenith of their power. According to the tradition of the Lydian migration, Pisa, and the whole country to the rocky summits of the Alps, were wrested from the Umbrians by the Tyrrhenians; and Pliny considers the Umbrians as the ancient inhabitants of Etruria who were expelled by the Pelasgians. Without entering into the question whether Cortona was Etruscan or not, still Cære, Graviscæ, Alsium, and Saturnia, were certainly occupied by the Etruscans as conquerors, after expelling the people callèd in Italy Siculians, and in Greece Pelasgians and Tyrrhenians. The Pelasgians were also in possession of Tarquinii before the Etruscans; Populonia was called a colony of the Volaterrans, who had driven the Corsicans from the coast; and Pisa is mentioned by Dionysius amongst the places which the Etruscans had wrested from the Pelasgians. But all statements, however probable or well attested, were at length forced to give way to the story of a Lydian extraction, which of necessity placed the first settlement of the immigrants on the lower sea, and thus involved the whole question in perplexity. What the native annals of the Etruscans related as to their origin we know only negatively; in them the Lydian legend which has created so much embarrassment had no place.[3] According to this view, then, there appear to have been two consecutive conquests: that of the Umbrians by the Pelasgians; and that of the Pelasgians by the Etruscans, who, as it were, absorbed all the others, and ultimately became the dominant people. The principal stock of the nation, however, seems to have been formed out of that great Pelasgian race which at one time extended from the rivers Po and Arno in Italy to the Phyndacus in Asia, but which, even when intermingled by conquest with other tribes, never succeeded in spreading itself over the whole of Northern Italy. The Etruscans, indeed, at no period of their history possessed the whole of Cisalpine Gaul. On the westward their territory extended only to the Ticinus, where dwelt the Ligurians, who were afterwards driven back by the Gauls; and the land to the south of the Po was also

[1] The names of Tuscan and Etruscans were as foreign to this people as that of Tyrrhenians. They called themselves *Rasena*, as already stated; and the other appellations applied to them were evidently arbitrary, accidental, or hypothetical. The ancient Roman terms were *Etruria* for the country, and *Tusci* for the people; that of *Etruscus* did not come into use till after Cato's time, though subsequently it became the more usual in the language of books. But the old name must have continued prevalent in the mouth of the people; for under the later emperors the name of *Tuscia*, which had never before been used in writing, was applied to the country, and in the middle ages passed into *Toscana*, whence *Toscani*. (Niebuhr, *History of Rome*, p. 90, Cambridge, 1828.) Professor Müller thus sums up his researches into the origin of the Etruscans: "It remains that we regard the Tuscan nation as an original and peculiar people of Italy; their language is widely different from the Greek; the names of their gods are not those which we find among the earliest Greeks, whom we call Pelasgi, and which passed from them to the Hellenes; there is much too in the doctrine of their priests entirely foreign to the Greek theology. But it appears to have been the fate of this nation, which never displayed any independent civilization, but only adopted that of the Greeks, to have been indebted for its first impulse towards improvement to a Greek, or at best half Greek tribe. The Tuscans themselves, in their native legends, referred their polity and civilization to the maritime town of Tarquinii and the hero Tarchon, both probably only variations of the Tyrrheni. Here it was that the much-dreaded Pelasgians of Lydia landed and settled, bringing with them the arts which they had acquired at home, or on their way. For the first time, the barbarous land saw men covered with brass array themselves for battle to the sound of the trumpet; here first they heard the loud sound of the Lydo-Phrygian flute accompanying the sacrifice, and perhaps witnessed for the first time the rapid course of the fifty-oared ship. As the legend, in its propagation from mouth to mouth, swells beyond all bounds, the whole glory of the Tuscan name, even that which did not properly belong to the colonists, attached itself to the name of Tarchon, the disciple of Tages, as the author of a new and better era in the history of Etruria. The neighbouring Umbrians and Latins named the nation, which from this time began to increase and diffuse itself, not from the primitive inhabitants, but from these new settlers. For since, in the Eugubine tables, *Tursce* occurs along with *Tuscom* and *Tuscer*, it is impossible not to conclude, that from the root TUR have been formed Tursicus, Turscus, Tuscus; as from the root OP, Opscus and Oscus; so that Τυῤῥηνοί, or Τυρσηνοί, and Tusci, are only the Asiatic and Italian forms of one and the same name." (*Die Etrusker*, vol. i. p. 100.)

[2] Hormayr, *Geschichte von Tyrol*, p. 139. This suggestion is eminently deserving of attention and verification. For as the Etruscan alphabet is known, the determination of a few roots would serve as a fulcrum, by means of which the great lever of tentative interpretation might be applied.

[3] "It is evident," says a late writer, "that the Etruscans themselves believed that they sprung from the Lydians, and that they *inculcated this belief on others*" (Dunlop, *Hist. of Rom. Literature*, vol. ii. p. 7); and he grounds this assertion on a circumstance mentioned by Tacitus (*Annal.* lib. iv. c. 55). Eleven cities of Asia contended, it would appear, for the infamous honour of erecting an altar to Tiberius; and this ridiculous and humiliating question was argued in presence of the tyrant, before that degraded senate whom he had publicly taunted with their abject servility. On this occasion the Sardians, one of the contending parties, insisted on their affinity to the Etruscans; in proof of which they produced a decree of that people, repeating the tale told by Herodotus, and of course attesting the original confraternity of the Sardians with the ancient inhabitants of Etruria. This is the statement of Tacitus. What degree of credit may be due to a document founded upon a vague tradition, flattering to popular vanity, produced in such a cause before such judges, and as to the authenticity of which the historian is silent, our readers will not, perhaps, find it difficult to determine. The only thing surprising is, that in such a competition of servility and adulation, a grave historian should have sought for materials to support an hypothesis, improbable in itself, and at variance with the best authorities on the subject.

either occupied by the latter, or rendered uninhabitable by swamps. When the Gauls made their irruption the Umbrians were still masters of the country now called Romagna; but between the Veneti and the Gauls, Etruscan settlements maintained themselves until the time of the Romans.

This people appear to have had twelve cities to the north of the Apennines, and an equal number to the south of that range. Amongst the former, of which we can give but a very indistinct account, may be classed Verona, which is denominated a Rætian city by Pliny, and Mantua, which is called Tuscan both by him and by Virgil. Hatria, Melpum, and Felsina were also included in the twelve cities north of the Apennines. Hatria, once a place of great commerce, gave its name to the upper sea; Melpum, to the north of the Po, was destroyed by the Boii, Senones, and Insubres, on the same day that Camillus took Veii (in the year of Rome 358); and Bononia, under the name of Felsina, was once the capital of Etruria. The twelve cities south of the Apennines, which were leagued together as the chief places of their respective districts, are nowhere enumerated by name; but Livy incidentally mentions eight of them, namely, Cære, Tarquinii, Populonia, Volaterra, Arretium, Perusia, Clusium, and Rusellæ, as having contributed to forward Scipio's preparations. Cortona was also accounted one of the chief places in Etruria, and both Veii and Vulsinii were probably included in the original number. But whether Capena, or Cossa, or Fæsulæ, completed the twelve, it is now impossible to decide; though there is some reason to believe that Capena, a strong city in a fertile territory, was the twelfth.

The territory belonging to each of these capitals had several provincial towns, some of them dependent colonies, and others inhabited by subjects, the descendants of the old population who had been subdued. But as the Etruscan state was founded on conquest, the government naturally assumed the character of an aristocratical oligarchy. It was not by popular assemblies, nor even by the deliberations of a numerous senate, but by meetings of the chiefs or magnates of the land (*principes Etruriæ*), that the general affairs of the nation were decided on. The assemblies held at the temple of Voltumna were of this exclusive kind, and hence in no degree corresponded with the institutions of really free nations, such as the Latins and the Samnites. These Etrurian chiefs were the persons from whom the Roman youth received instruction in the sacred sciences of divination; they were at once a warlike and sacerdotal caste, the Lucumones whose ancestors had committed to writing the revelations of Tages. But they were patricians, not kings, as has been commonly supposed. Lucumo of Clusium, Lucumo who succoured Romulus, and Lucumo who removed from Tarquinii to Rome, were only powerful men in their respective cities; the Cilnii and Cæcinæ were Lucumones in Etruria, just as the Claudii and Valerii were patricians in Rome, and were not less noble in birth than the latter, though, as Romans, reckoned only amongst the commons. But these ruling houses were exposed to the violent revolutions which everywhere threaten an oligarchy, even in the midst of its own body, when it is not upheld by some powerful protection from without. The chiefs expelled each other by force of arms, or were driven into exile by the combinations of intrigue; and it was in the spirit of these feuds for the refugees to be restored by the dangerous mediation of the common enemy, the Romans. Even so late as the second Punic war, the government of the Etruscan cities remained exclusively vested in the senators, or nobility; the latter were, what Louis XIV. called himself, the state; and, when a ferment began in Etruria, it was entirely suppressed by securing the submission of the senate at Arretium. The people, who had no political existence as such, were out of the question. A free and respectable commonalty was never formed amongst the Etruscans; on the contrary, the species of feudal system, anciently established by conquest, was obstinately maintained and extended; the mass of the population were mere serfs; and hence arose the remarkable weakness of the great Etruscan cities in their contests with Rome, when the victory was to be determined by a numerous, brave, and steady infantry. National impotence ever follows the degradation of the people. What the Etruscans might have been if, some centuries earlier, they had had a country, is evinced by the effect of the Roman franchise conferred upon them at the conclusion of Sylla's war. In this contest the part taken by the chiefs was taken by all; and every free man, however excluded or restricted by the old but now expiring constitutions of his own country, obtained the privileges of Roman citizenship; nor was the boon either undeserved or misapplied.

The regal office, which was not hereditary in a single family, as in Greece, but elective for life, as at Rome, continued at Veii until its fall. At Arretium, however, the king may perhaps have been chosen from amongst the Cilnii, a family of high distinction. The twelve federal cities nominated a common high priest, who presided at the national festivals. In common enterprises the supreme command was generally committed to one of the twelve Lucumones, who received a lictor from each city. Even Porsenna, highly as he is celebrated in the old legends, is in Roman history only king or chief of Clusium; yet he had influence sufficient to set the whole power of the nation in action. In like manner all the twelve cities paid homage to Lucumo Tarquin; and in the earlier times a closer union seems occasionally to have been effected by the power of a supreme chief, as Mezentius or Cœles Vibenna. But such union appears to have been the exception rather than the rule, and to have depended on accident rather than on organization; nor have we been able to discover satisfactory evidence of the existence of a distinct federal constitution, such as some writers have rather gratuitously imagined. Yet loose as was the federal bond in Etruria, it seems to have had the effect of preventing wars between the cities, of which no trace is to be found in history. Such, then, being the nature of their association, it is probable that the islands subject to the Etruscans were not under the dominion of the whole nation, but under that of the adjacent maritime cities; and, accordingly, it seems as if the Cærites stood alone when, leagued with the Carthaginians, they attacked the Phocæans of Alalia, which happened in the year of Rome 220. The principal insular dependency of the Etruscan states was Corsica, which paid them a tribute; but it is not improbable that they had also settlements in the island of Sardinia.

The maritime cities of Etruria having early engaged in navigation, were stigmatised and hated on account of the piracies they committed in the western seas, which, anterior to the founding of the Grecian colonies in Sicily, were thus rendered impassable to peaceful navigators. Niebuhr is, however, inclined to think that this reproach may have applied chiefly to the Pelasgian Tyrrhenians, whom the Etruscans afterwards subdued; and indeed all the corsairs of the lower sea seem to have been considered by the Greeks as Tyrrhenians. But without entering into any details respecting their nautical adventures, whether piratical or other, it may be observed, that navigation naturally implies an interchange of commodities; and a fruitful land, rich in internal treasures, supplied abundant materials for the commercial spirit in Etruria. From a very early period the Etruscan maritime cities appear to have engaged in com-

 merce; and in the time of Aristotle, treaties, by which the rights of trade were respectively determined and secured, subsisted between these cities and Carthage. Amongst the subjects of this commerce may be mentioned the produce of the iron mines of Elba,[1] and of others upon the mainland of Etruria, which yielded a more abundant supply of a purer kind of metal than any in the ancient world. The same island also furnished copper for their coinage, and for those works in brass or bronze in which they so greatly excelled. Müller supposes them to have also traded in amber, which substance, he thinks, they received by an inland route, extending from the shores of the Adriatic to those of the Baltic; but as his chief reason for this supposition appears to be, that, in Pliny's time, amber was conveyed by the same route into Italy, and as no safe conclusion can be drawn respecting the extent of early communications, from those which are found established at a later period, when circumstances had wholly changed, the conjecture in question must, we suspect, be dismissed as untenable. On the subject of Etruscan commerce, however, the information which has reached us is too scanty and imperfect to enable us to deduce any distinct conclusions, either as to the extent to which it was carried on, or the particular channels in which it flowed.

The works constructed by the Etruscans still astonish us even in their ruins, and could scarcely have been executed in small states without taskmasters and bondsmen. The everlasting monuments of Egypt are the products of the direst tyranny acting remorselessly upon the most abject slavery. But the scarcely less durable works of the Etruscans differ from those in the valley of the Nile, in having all of them been directed towards some great object of public utility. Labour was not uselessly or wantonly expended in the erection of pyramids, obelisks, and temples, to gratify the inordinate vanity of despots, or to extend the empire of superstition; if the people suffered in the hard service imposed on them, it was not for vain or idle purposes; they were employed by their rulers on whatever seemed best calculated to promote the defence or augment the wealth of the nation at large. The walls of their cities, constructed of huge blocks of polygonal stones, still subsist in imperishable solidity, where pains have not been taken to demolish them; the theatre at Fiesole, and a colossal building near it, are on a scale of equal grandeur; and other monuments might be mentioned which have been constructed in the same Cyclopean style. The rich valley of the Arno, anciently a lake and a swamp, was drained by means of a cut through Mount Gonfalina, which blocked up the valley, but which, by means of this operation, was made to afford a passage for the stream towards Pisa; the arms, too, by which the Po discharges itself, were also excavated or directed by the Etruscans; and its Delta was likewise the fruit of their labours. Another useful art practised by this people consisted in letting off, by means of tunnels, lakes which had been formed in the craters of extinct volcanoes. In the territory of Perugia there are traces of many such lakes, which have been completely dried up, by means of the tunnels, which, though now unknown and never cleared out, still drain off the water as before.

The renown which belongs to a nation that excelled in the arts has become as it were the inheritance of the Etruscans. But from the peculiar constitution of government and society in ancient Etruria, it has been conjectured, not without appearance of reason, that the works in bronze and clay, and the bas-reliefs, attributed to them, were the produce, not of the dominant race, but of their subject bondsmen or serfs; and that in reality the Etruscans, properly so called, were as little given to the arts as the Romans by whom in their turn they were subdued. The striking difference observable between Tarquinii and Arretium in their works of art, seems to correspond with the different origin of the earlier inhabitants of northern and southern Etruria. Volaterra was naturally led, by the stone quarries in its neighbourhood, to engage in the works for which it became celebrated. The two former cities, however, wrought only or chiefly in clay. Arretium made red vases, with elegant figures in relief, in a style altogether peculiar. Those of Tarquinii were painted, and both in colour and design resemble some discovered near Corinth, of which Dodwell has given engravings. Painted vases are found only in the district of Tarquinii, and where they occur those of Arretium are never met with; besides, they differ from the Campanian in all those peculiarities for which the Greek works of the same kind are distinguished. The resemblance which is thus found to exist between the vases of Tarquinii and of Corinth irresistibly reminds us of the story of Demaratus, who is said to have been accompanied by the potters Euchir and Eugrammus; a circumstance evidently designed to express that Tarquinii derived from Greece her skill in handling clay, and the elegant drawing with which her vases were adorned. The earliest Etruscan statues were of clay; but the statues belonging to the first ages of Rome were almost uniformly of bronze, and the master-pieces which shed lustre on Etruscan art are all of the same material. That this art received its refinement from the Greeks cannot, we think, be reasonably questioned. Works of primitive antiquity attest its original rudeness; and to the Greeks alone, improving on Egyptian models by a close study of the finer forms and proportions of nature, belonged that skill which throws life and beauty into the delineation of the human figure. Hence the subjects of many of the most beautiful Etruscan works of art are obviously taken from the Greek mythology, which, in Etruria, was found as well adapted to the purposes of the artist as in the land to which it was native. But the Etruscans, when their taste had once been formed, treated their own conceptions in the spirit of their masters; and, though no doubt inferior in grace and delicacy of execution, they acquired a correctness in drawing which may almost be stated as a national characteristic. In the she-wolf of the Capitol we have an example of the perfection to which Etruscan art had attained about the middle of the fifth century of Rome; nor are the finest gems probably of a much more recent date. See Plates CCLIII., CCLIV., and CCLV.

As a national heroic story was wanting to Etruscan art, it sought for subjects in the Greek mythology; and the legends of Thebes and of Ilium must have been familiar to the people. The Greek poems were read in Etruria, and Greek legends, transfused into Etruscan, lived in the speech of the nation, or in compositions in the native tongue. Indeed the works of art are not unfrequently inscribed with the names of the Greek heroes, adapted to the forms of the Etruscan language, of which it is matter of regret that so little is yet known. Varro mentions Tuscan tragedies by one Volnius, who, it appears, lived not long before, and probably intended these as an experimental attempt to introduce a national drama. But be this as it may, the Grecian construction of the theatre at Fæsulæ is evidence that Greek dramas, either originals or translations, were performed there, as well as at Tusculum and Bovillæ in Latium; nor can it be doubted that this

[1] Insula inexhaustis chalybum generosa metallis. (*Æn.* x. 174.)

theatre is much earlier than the time of Sylla, since in size and magnificence it far surpasses the scale of a Roman military colony, which, besides, cannot be supposed to have had any taste for the exhibitions peculiar to such a place. The amphitheatre was the only place to which such colonists would have repaired for amusement. It is proper to add, however, that in Etruscan inscriptions we do not find any thing bearing the slightest resemblance to Greek rhythms, which could scarcely have been concealed even in an unintelligible language; and that the place whence the Fescennine musical dialogue received its name was a Faliscan, not an Etruscan town.

The music of the Romans was derived from Etruria, whence also they obtained their scenic or histrionic singers. This is the only branch of art in which the ancients attributed to the Etruscans the honour of invention; but here the invention related merely to the instrument; for we do not read of any mood or measure ascribed to the Etruscans. This instrument was the flute, which the Romans regarded as native to Etruria, though modern antiquaries pretend that it is to be considered as of Lydian origin, and even as a proof of the Lydian immigration mentioned by Herodotus. The celebrity which the Etruscans obtained in music, as well as in other accomplishments, was, no doubt, in part owing to their having been the neighbours of a rude and uncultivated people like the Romans, who naturally admired whatever was new or strange, and who, until they became acquainted with the Greeks, derived all that was ornamental in their system of public and private life from Etruria.

The literature of the Etruscans presents the singular phenomenon of an alphabet almost perfectly deciphered, with a language completely unintelligible. A combination so strange has led more than one writer to maintain that the language is Pelasgic or Æolic Greek, and to appeal in proof of this to the alphabet; but, unfortunately, there is a total want of connection between the premises and the conclusion; and the result of all the investigations yet instituted has been to disprove this notion. The Etruscan characters were formed like the Greek, from that one amongst the various Asiatic alphabets whence all the modes of writing in use throughout Europe appear to have been derived. That Etruria received them directly from the Phœnician would not certainly be proved by the direction of the writing from right to left; but when to this we add the omission of the short vowels, the practice of noting double consonants by a single letter, as in all the Aramaic systems of writing, and the want of the vowel O, which are peculiarities purely Punic, the presumption in favour of Phœnician origin is considerably increased. From this last circumstance, however, nothing can be decisively determined as to the pronunciation, inasmuch as the Semitic languages are not defective in the vowel, which is wanting to the Etruscan. The Phœnicians also distinguished numbers by letters; but not so the Etruscans. What we denominate the Roman numerals are of Etruscan origin, and occur frequently on their monuments, being probably the abbreviated remnants of a hieroglyphical art of writing in use before the alphabetical, and, like the Aztecan numerals, representing objects connected with particular numbers. Niebuhr thinks them indigenous to the west. But however this may be, the literal form which these numerals have now assumed cannot mislead any one as to their hieroglyphical origin. With respect to the Etruscan language, which remained harsh in sound and uncouth in its forms, all the labour which has hitherto been bestowed in attempting to interpret it, though valuable for its collateral results, has proved wholly fruitless in reference to its direct object. Lanzi, abandoning the oriental and northern etymology, endeavoured to explain the Etruscan from the Pelasgic; and for many years after the appearance of his Essay, his explanations were acquiesced in, and even made the basis of various etymological hypotheses. But when at length credulity gave place to inquiry and examination, it was perceived that his modes of proceeding were much too arbitrary; that he had produced no evidence of the existence of the words and forms which he had assumed to be Greek, in order to identify them with the Etruscan; and that other monuments, discovered since his time, could not in any way be explained by his system. In short, his interpretation was purely tentative and conjectural, without even accidental felicities of supposition; and hence, of all the Etruscan words, of which pretended explanations have been given, only two (AVIL RIL, *vixit annos*, or rather perhaps *ætatis annos*) seem to have been really interpreted. Professor Müller's observations on this subject are well deserving of attention, especially in reference to the expectations which appear to be entertained of the enlargement of our historical knowledge by the comparison of languages.

"We might give much ampler satisfaction," says he, "if, after Lanzi's method, we sought in the monuments of the Etruscan language for single sounds resembling the Greek and Latin, and, persuaded that similar sounds must have a similar meaning, endeavoured to explain all that could not be brought to agree, by an arbitrary prothesis, epenthesis, paragoge, and similar cheap expedients. Without blaming the learned Italian, in whose time the most eminent literati had very confused ideas of the formation of language, we may maintain that his leading principle (that analogy is the character only of cultivated languages, and that the ruder any language is, the greater liberty might be taken in the use of it) is entirely false. This may justify us for having paid so little regard to etymologies, which, as they are arbitrary in themselves, suppose an arbitrary character in the language to which they are applied. If we use only genuine monuments, and require a certain evidence for every explanation of a root or a grammatical form, our apparent knowledge of the Etruscan language shrinks almost to nothing....... It is not probable that the application of the still existing remains of the languages of the north and north-west of Europe should have those beneficial results for our knowledge of Etruscan which some appear to anticipate. The Germans and Celts are originally divided in a very marked manner, by their locality, from the nations of the Mediterranean; they only gradually approach these and come into collision with them; and even though the languages of both nations may belong to that great family which from time immemorial has diffused itself throughout Europe and Asia, yet they have distinct peculiarities, which we have no reason to believe are found in those of Italy. One fundamental and indelible characteristic of the Celtic languages seems to be, that they mark grammatical forms by aspiration and other changes of the initial consonants; a thing not practised in any other European language, but found in all the branches of the Celtic, as the Welsh, Cornish, Gaelic, Irish, and *Bas Brêton*. This mutability of the consonants is a circumstance which must be perceptible even in a small number of written remains, and which could not well have escaped us had the Etruscan been Celtic. The Iberian family, once widely diffused on the shores of the Mediterranean, may have dwelt in close vicinity to the Etruscans; but the remains of its language in the Basque are completely different from the rest of Europe; and its grammar shows so little affinity with what we know of the Etruscan, as to afford very slight support to the opinion of the affinity of the two nations. What may have been the relation of the Tuscan to the extinct Ligurian, or to the language of those Alpine

tribes whose names alone are preserved in history, is a question respecting which we have not even a glimmering of knowledge."[1]

Any attempt indeed to interpret the Etruscan, without the aid of bilingual inscriptions, such as those on the Rosetta stone and obelisk of Philæ, which afforded a key to the Egyptian phonetic hieroglyphics, will be pure loss of labour. The discovery of such monuments, however, is, in regard to time and manner, an incalculable event; but still it is within the range of probable calculation; and the age which has witnessed the interpretation of Egyptian hieroglyphics by means of such aids should not hastily despair of anything. If a translation were discovered, not in Latin or Greek, but in Oscan or even Umbrian, the latter have so much affinity to the Latin, that much might be learned from such a version for the explanation of the Etruscan. By the successive labours of Lassen, Grotefend, Botta, Hincks, Layard, and, above all, of Colonel Rawlinson, we have at length obtained a clew to the Assyrian *arrow-headed character;* and the ingenuity which has unravelled the mysteries of Egyptian hieroglyphics, it is not unreasonable to expect will yet penetrate the cloud that has so long veiled the meaning of those ancient records of Etruria.

Of the early history of Etruria we can only collect a few detached facts of little importance, which are to be gleaned from Livy, and from short notices in the Greek historians and poets; and must ever deplore the loss of the works of Aristotle and Theophrastus on the civil institutions of the Tyrrheni, as well as regret that the history of the Emperor Claudius has disappeared. We find this people engaged in a contest with Tarquinius Priscus (about 610 B.C.), but obliged to acknowledge at least a nominal dependence on the power of Rome. They joined the Carthaginians in an attack on the Phocæans, who having left Asia Minor (about 547 B.C.) to escape the persecutions of Cyrus the elder, had settled in Corsica, and threatened to dispute with them the supremacy of the western seas. For the next two centuries they appear to have enjoyed tranquillity; until, roused to exertion by the ever encroaching spirit of the Romans, they determined to make a united effort to check the power of their dangerous neighbours. The hostile forces met (309 B.C.) near Lake Vadimon, which is still to be seen on the east of Etruria, near the Tiber, below the modern village of Bassano; and the result was, as usual, favourable to the cause of Roman supremacy. The Tuscans were completely defeated; and from this moment were compelled to co-operate in extending and strengthening the power of the conqueror. They now became incorporated with the Roman people, and can no longer be considered as a separate nation.

For a detailed account of this people, see Micali *L'Italia avanti il dominio dei Romani*, Milan, 1825, with *Antiqui Monumenti per sevire all' Opera intitolato* L'ITALIA, &c., Frienze, 1821; *L'Italie avant la Domination des Romains*, with historical notes and illustrations by M. Raoul-Rochette, Paris, 1824, in 4 tomes; Niebuhr's *Roman History*, English trans., Cambridge, 1828, in 2 vols.; Müller, *Die Etrusker, vier bucher*, Breslau, 1828; Inghirami, *Monumenti Etruschi o di Etrusco nome*, 1821–1825, in 6 vols. 4to; Heyné, *Etrusca Antiqua*, Nov. Soc. Götting. 1766; and Gori, *Museum Etruscum*. For the ancient language of Etruria, see Dempster, *De Ætruria Regali*, Florence, 1723, in 2 vols. fol.; Lanzi, *Saggio di Lingua Etrusca, e di altre Antiche d'Italia*, 1789, in 3 vols. 8vo; and Müller, *Die Etrusker*, above referred to. (J. B—E.)

The excavations recently made within the limits of the ancient Etruria, and the researches of various Italian and foreign antiquaries, have, within the last few years, thrown additional light on the sites of Etrurian cities, and illustrated the arts and manners of that singular people. The English reader will find a lively account of some of these discoveries in the pages of Mrs Hamilton Gray, and a more ample and well-digested detail in *The Cities and Cemeteries of Etruria* by George Dennis, published in 2 vols. in 1848. In this work we find the following enumeration of the sites of Etrurian cities, most of them established on very fair data.

Veii.........near	Isola Farnese.
Fidenæ.........	Castel Giubleo.
Falerii, *Vet. et Nov*.........	Civita Castellana.
Feronia.........	St Oreste.
Capena.........	Chiesa di S. Martino.
Norchia, or Orcle?.........6 miles from	Vetralla.
Castellum Axia.........	Castel d'Asso.
Blera.........	Bieda.
Tarquinii.........near	Corneto.
Vulci.........on the Fiora near	Ponte della Badia.
Tuscania.........	Toscanella.
Volscinii.........	Bolsena.
Salpinum.........near	Ovieto?
Cære or Agylla.........	Cervetri.
Pyrgi (its port).........	Santa Severa.
Pisæ.........	Pisa.
Rusellæ.........	Rosella.
Cosa.........	Assedonia.
Populonia or Pupluna.........	Populonia.
Vetulonia, discovered in 1842.........	Magliano.
Telamon (its port).	
Saturnia.........	Saturnia.
Clusium.........	Chiusi.
Arretium.........	Arezzo.
Perusia.........	Perugia.
Cortona.........	Cortona.
Fæsulæ.........	Fiesole.

Second-rate Towns.

Sustrum.........	Sutri.
Nepale.........	Nepi.
Surrena or Sorena.........	Viterbo?
Horta.........	Orte.
Graviscæ.........on right bank of the	Marta, on the coast.
Statonia?.........near	Tarquinii, at Castro.
Alsium.........	Palo.
Fregellæ.........	Torre de Maccarese.

Unascertained Etruscan remains

At Corchiano.	At Cetana.
Galere.	Sarteano.
Vignanelle.	Chianciano.
Orbitello.	Montepulciano.

ETSCH, a river of Italy. See ADIGE.

ETTLINGEN, a town of Baden, capital of a cognominal bailiwick in the circle of Middle Rhine, five miles S. of Carlsruhe. It is situated on the Alb, and has cotton-spinning, gunpowder, and paper mills. Pop. 4500.

ETTMÜLLER, MICHAEL, an eminent physician, born at Leipzig, May 26, 1644. After having studied languages, mathematics, and philosophy, at his native town, he went to Wittenberg, whence he again returned to Leipzig, and obtained a medical diploma in 1666. After travelling in Italy, France, and England, he retired to Leyden, where he had intended to spend some time in study, but was suddenly recalled to Leipzig in 1668, where he received the degree of doctor immediately after his arrival. The Academy of the Curious in Nature admitted him as one of its members in 1670, and the Faculty of Medicine in 1676. About the same time the university of Leipzig confided to him the chair of botany, and appointed him extraordinary professor of surgery; the duties of which he discharged with distinction. But he did not long enjoy his preferment; for he was suddenly cut off, 9th March 1683, in consequence of a hectic fever, occasioned, as some say, by a chemical experiment. Although Ettmüller only wrote short dissertations and mere *opuscula*, he nevertheless enjoyed an immense reputation. He had the art of interest-

[1] *Die Etrusker*, vol. i., p. 64, *et seq.*

ing and fixing the attention by a ready elocution, and by arguments sometimes much more specious than solid. The following is a list of his works :—

De Singularibus, a thesis defended by Ettmüller in 1663; *Medicina Hippocratis Chimica*, Leipzig, 1670, in 4to; *Vis Opii diaphoretica*, Leipzig, 1679, in 4to; *Chimia Rationalis ac Experimentalis curiosa*, Leyden, 1684, in 4to; *Medicus Theoria et Praxi generali instructus*, Frankfort and Leipzig, 1685, in 4to; *Opera Omnia theoretica ac practica*, Lyons, 1685, in 4to; *Opera Omnia; nempe Institutiones Medicinæ cum Notis, etc.*, Frankfort, 1676, 2 vols. fol.; *Operum Omnium Medico-physicorum editio novissima*, Lyons, 1690, 2 vols. fol.; *Opera Omnia in Compendium redacta*, London, 1701, and Amsterdam, 1702, in 8vo. The best edition is that of his son, entitled *Opera Medica theoretica-practica per filium Michaelem Ernestum, etc.* Frankfort, 1708, 3 vols. fol. There is no complete translation of the works of Ettmüller, but there are numerous German, English, and French translations of the different treatises.

Michel Ernest Ettmüller, son of the preceding, born at Leipzig in 1673, was also a physician of some eminence. Besides collecting and editing the works of his father, he wrote a number of theses and memoirs. He died Sept. 25, 1732.

ETTRICK, a river, parish, and forest of Selkirkshire. See SELKIRK.

ETTY, WILLIAM, R.A., one of the most eminent of British painters, was, like Stothard and Flaxman, a native of York, where he was born 7th March 1787. His father had been in early life a miller, but had finally established himself in the city of York as a baker of spice-bread. His mother was in many respects a remarkable woman, and from this parent Etty, like many other men of genius, inherited the qualities by which he became distinguished in after life. The painter was the seventh in a family of ten, five of whom died young. With so many children to provide for out of comparatively slender means, it was impossible for the elder Ettys either to educate their family themselves or to send them to the public schools of the city. After some scanty instruction of the most elementary kind, the future painter, at the age of eleven and a half, left the paternal roof, and was bound apprentice in the printing-office of the "Hull Packet." Amid many trials and discouragements he completed his term of seven years' servitude, and having in that period come to know his own powers, he removed at the close of it to London. The kindness of an elder brother and a wealthy uncle stood him in good stead during his long and noble struggle against the trials and difficulties that beset the career of nearly every person who adopts the profession of art for its own sake. After a year and a half of preliminary study, he was enrolled in 1807 as student of the Academy, whose schools were at that time conducted in Somerset House. Among his fellow scholars at this period of his career were some of those who in after years rose to eminence in their art, such as Wilkie, Haydon, Collins, Constable, and others who still survive. This year is also memorable in Etty's life as that in which he enjoyed the privilege of the private instructions of Sir Thomas Lawrence, who was now at the very acme of his fame. Etty himself always regarded this privilege as one of incalculable value, and till his latest day regarded Lawrence as one of the chief ornaments of British art. For some years after he quitted Sir Thomas's studio, even as late as 1816, the influence of his preceptor was traceable in the mannerism of his works; but his later pictures prove that he had completely outlived it. Though he had by this time made great progress in his art, his career was still one of almost continual failure, hardly cheered by even a passing ray of success. It was not till 1811 that the sun began to shine upon him. In that year, after repeated rejections, he had the satisfaction of seeing his first picture on the walls of the Academy's exhibition-room. For the next five years he persevered with quiet and constant energy in overcoming the disadvantages of his early training with yearly growing success, and was even beginning to establish something like a name, when in 1816 he resolved to improve his knowledge of art by a journey to Italy. After an absence of three months, however, he was compelled to return home without having penetrated farther south than Florence. Struggles and vexations still continued to harass him, but he bore up against them with a patient endurance and force of will which ultimately enabled him to rise superior to them all. He had resided at home nearly six years since his unsuccessful journey into Italy, when he resolved to make arrangements by which he should be enabled to spend at least eighteen months in that native country of the pictorial art. Accordingly in 1822 he set out on his tour, taking Paris on his way, and astonishing his fellow-students at the Louvre by the rapidity and fidelity with which he copied from the old masters in that gallery. On arriving at Rome he immediately resumed his studies of the old masters, and elicited many expressions of wonder from his Italian fellow-artists for the same qualities as had gained the admiration of the French. Though Etty was duly impressed by the grand chefs d'œuvres of Raphael and Michael Angelo at Rome, yet he was not sorry to exchange that city for Venice, which he always regarded as the true home of art in Italy. His own style held much more of the Venetian than of any other Italian school, and he admired his prototypes with a zeal and exclusiveness that sometimes bordered on extravagance. Early in 1824 he returned home to find that honours long unjustly withheld were awaiting him. In that year he was made an associate of the Royal Academy, and three years later he was promoted to the full dignity of an academician. In the interval between these dates he had produced the "Combat," and the "Judith," both of which ultimately came into the possession of the Scottish Academy, which body, to their credit be it told, were the first to discern and publicly appreciate the genius of Etty, and the value of his contributions to art. Etty's career was from this time one of slow but uninterrupted success. His works were not now as formerly allowed to remain upon his hands unsold; and though the prices which they fetched were almost incredibly small in comparison with the value now attached to them, yet they satisfied the artist's requirements, and even tempted him to persevere in the dangerous career of high art. In 1830 Etty again crossed the channel with a view to another art-tour through the Continent; but he was overtaken in Paris by the insurrection of the Three Days, and was so much shocked by the sights he was compelled to witness in that time, that he returned home with all convenient speed. During the next ten years of his life the zeal and unabated assiduity of his studies was not at all diminished, and he continued with marvellous regularity his various routine-duties in connection with the Academy, though his health was far from robust, and his circumstances were now such as to put it in his power to dispense with the multifarious drudgery which the fulfilment of these duties demanded. The course of his studies was only interrupted by occasional visits to his native city, and to Scotland, where he was welcomed with the utmost enthusiasm, and *fêted* with the most gratifying heartiness by his brother-artists at Edinburgh. On the occasion of one of these visits he gave the finishing touches to the trio of Judiths, which form not the least interesting or valuable feature in the collection of the Scottish Academy. In 1840, and again in 1841, Etty undertook a pilgrimage to the Low Countries to seek out and examine for himself the masterpieces of Rubens which exist in many of the churches and public galleries there. Two years later he once more visited France with a view to collecting materials for what he called "his last epic," his famous picture of "Joan of Arc." This subject, which would have tasked to the full even his great powers in the prime and vigour of manhood, proved almost too serious an undertaking for him in his old age. It exhibits, at least, amid great excellences, undeniable proofs of decay on the part of the painter; yet it brought a higher price than any of his earlier and more

Etty.

perfect works, viz. L.2500. In 1848, after completing this work, he retired to York, having realized a comfortable independence. Even his advanced years and increasing infirmities were as yet unable wholly to quench his artistic enthusiasm; for when his health allowed, he worked as assiduously as in his younger days. One wish alone remained for him now to gratify; he desired to see a "gathering" of his pictures. With much difficulty and exertion he was enabled to assemble the great majority of them from various parts of the British islands; and so numerous were they, that the walls of the large hall he engaged in London for their exhibition were nearly covered. This took place in the summer of 1849: on the 13th of November of that same year Etty died. On the occasion of his funeral, which was a public one, and attended by the corporation of York, the shops in the city were shut, the bells of the various churches were tolled, and other marks of respect paid to the memory of the deceased artist.

Etty has delineated himself in his autobiography (published in the Art-Journal), and in his letters and diaries recently (1855) given to the world in Mr Gilchrist's "Life" of this celebrated artist. The reproach often alleged against artists and men of science, that as men they are most frequently quite uninteresting, cannot with truth be asserted against Etty. In many points of view his is not only an interesting but a highly instructive career. Born of humble parents, without any advantages of early training, and in the face of difficulties before which any man might honourably have given way, he yet achieved for himself, by the innate force of genius, a conspicuous place in that walk of art which he selected for his own. It was not by a brilliant precocity, or the factitious success which sometimes accompanies the skilful mannerist or the daring innovator in art, but by a means resembling the slow certainty with which most of the great discoveries in physical science have been made in accordance with the inductive method, that he attained this result. Year after year he struggled on, often heart-sick and weary of the contest, yet with the inflexible resolution of reaching the point proposed, and in the attempt removing, so far as in him lay, the reproaches to which English art had too often been exposed from its successful cultivators on the Continent. The Italians, especially the Venetians, were the first to recognise very decidedly Etty's merits, more especially as a colourist. While copying the great masters in the Venetian galleries, he was often complimented with such expressions as "è un Ercole," "è un Tiziano," &c., and that not by casual acquaintances anxious to ingratiate themselves with him, but by fellow-artists as able and willing to detect blemishes as to acknowledge beauties. Similar and equally decided compliments were showered down upon him by the French who had opportunities of seeing him at work in the Louvre. The world at large now fully appreciates the works of this painter; and though it be too much to say that Etty equalled Titian as a colourist, yet it may perhaps be allowed to claim for him the name of the English Rubens, and all the respect and honour due to such a title. In private life Etty was in many respects an admirable type of the English character. The lessons which he learned in early life from his mother continued to guide and influence him to the end; and though his religionism appears to have held more of sentiment than of study and conviction, yet it stood him in equally good stead in so far as it led him safely through the temptations with which the life of the artist is frequently beset. In the expressions of simple piety, manlike faith in the wisdom and goodness of an over-ruling Providence, and child-like submissiveness to its dispensations, the letters of Etty abound almost as much as those of Cromwell. For trivial backslidings, such as many men fall into without a thought, Etty implores forgiveness as fervently as if he had committed some heinous sin. The same principle seems to have actuated him in his dealings with his fellow-men. From the feeling of jealousy so common among artists, and from which he suffered so much himself, he was completely free. There is no more striking instance than his on record of generosity towards distressed fellow-artists, and of liberal encouragement of art, both by direct pecuniary aid and by the devotion of much valuable time to the service of the Academy. Towards his native city his heart always yearned with the most earnest longing. The course of modern improvements threatened from time to time the destruction of some of the interesting antiquities of the city. On these occasions the painter was ever ready both with tongue and pen to protest against the impending vandalism, and with such success that nearly everything that now remains to differentiate York from other provincial towns in England is due to his exertions. His grief for the Minster, which on two occasions was nearly destroyed by fire, was as poignant and lasting as is often testified by parents for the loss of a favourite child. His homeliness and domestic notions of comfort are also very English in character. Even in the course of his repeated journeys to the Continent, he used to carry with him a complicated tea-apparatus, which often excited the curiosity and suspicion of the custom-house officers in the various countries which he entered. (For a detailed account of the life, character, and habits of Etty, see the careful and interesting "Life" recently published by Alexander Gilchrist, Esq., of the Inner Temple, London.)

Etymology ‖ Eubœa.

ETYMOLOGY (ἔτυμος, *true*, and λόγος, *discourse*), that branch of philology which treats of the origin and derivation of words, with a view to ascertain their radical or primary signification.

EU, a town of France, department of Seine-Inferieure, arrondissement of Dieppe, and 17 miles N.N.E. of the town of that name. It is situated on the small river Bresle, about two miles from its mouth, in the English Channel, and contains about 4000 inhabitants. Eu was a place of some importance in the middle ages, but it was burned by Louis XI. in 1475 to prevent its falling into the hands of the English, and has never attained its former condition. It is chiefly remarkable for its *château*, built by the Duke of Guise in 1578 on the site of a castle destroyed with the rest of the town in 1475. This château was greatly enlarged and richly decorated by Louis-Philippe, to whom it came by succession, and here he received the Queen of England in 1843. It is surrounded by an extensive park and gardens. The parish church is a fine Gothic edifice, under which is a crypt containing numerous monuments of the Artois family.

EUBŒA (now Egripo or Negropont), the largest island in the Ægean Sea, is separated from the coasts of Attica, Bœotia, Locris, and Thessaly, by the Eubœan Sea, which, at its narrowest part, between Chalcis and the Bœotian shore, is called the Euripus. The length of the island, whose general outline is long and narrow, is about 90 miles; its breadth varies considerably—at the broadest part it measures about 30 miles, at the narrowest not more than four. It is traversed throughout its entire length by a mountain range, some of the peaks of which attain a great elevation. On the eastern coast Dirphys or Dirphe, now Mount Delphi, rises 7300 feet above the sea. At the southern extremity the highest mountain is Oche, now called St Elias, rising to the height of 4750 feet. On the western side, the highest peaks are Mounts Kandhili and Telethrius, the former 4200 and the latter 3100 feet above the sea. At the foot of Mount Telethrius are the celebrated hot springs, known as the Thermæ. Opposite the entrance of the Maliac Gulf is the promontory of Cenæum, near which is Mount Lithadha nearly 2900 feet high. At the N.E. extremity of the island is the promontory of Artemisium, celebrated for the great naval victory gained by the Greeks

over the Persians, B.C. 480. The continuous plains in the island are few in number and comparatively small in extent. The largest of these is that of Lelantum, between Eretria and Chalcis; next that of Histiæa, at the northern extremity of the island, opposite the coast of Thessaly. The south-western portion of the island was called Geræstus, the south-eastern Caphareus.

Eubœa was believed to have originally formed part of the mainland, and to have been separated from it by an earthquake. Its northern extremity is separated from the Thessalian coast by a strait which at one point is not more than a mile and a half in width. From the promontory of Cenæum southwards for about fifteen miles the depth of the channel is so great that half a mile from the shore no bottom has been found with 220 fathoms of line. The water, however, gradually shoals from this point to Chalcis. At this town the strait, assuming the name of Euripus, contracts to a breadth of not more than 120 feet; and a bridge has been thrown across it at this point, connecting the island with the Bœotian coast. The rivers of Eubœa are so few in number, and so scanty in volume, that the scarcity of water is often severely felt. On the eastern side are the Budorus, and the Lelantus flowing through the plain of the same name. On the north coast was the Callas. Two other streams, the Cereus and the Neleus, are mentioned, about which nothing is known save that sheep dipped in the former became white and those in the latter black. The level ground of Eubœa, which is of no great extent, was fertile in corn; while the mountains afforded excellent pasture for sheep and cattle. These pastures belonged to the state, and were let out to such as could afford to pay the necessary rent. In the mountains were several valuable mines of iron and copper; and the marble quarries of Carystus at the south of the island were among the most important of Greece.

Eubœa was originally known under other names, such as Macris, Helliopia, Oche, and Abantis. By Homer the inhabitants of the island are called from this latter name Abantes, though the island itself is mentioned under its name of Eubœa by the same poet. In historical times Eubœa was inhabited chiefly by Ionic Greeks, and of these the Athenians were the most prominent. As the island never at any time formed a separate state, it is impossible to give a general history of it as a whole. The history of the leading cities will be found under their respective heads. See CHALCIS, ERETRIA, HISTIÆA, &c. For the modern history of Eubœa, see NEGROPONT.

EUBULIDES, a native of Miletus, was a distinguished philosopher of the Megaric school. The principal events in his personal history are quite unknown. Indirect evidence shows that he was a younger contemporary of Aristotle, whose philosophy he attacked with great bitterness, and that he numbered Demosthenes among his pupils for a while. He is not known to have written any independent work, and his name has been preserved chiefly on account of some celebrated though false and captious syllogisms of which he was the reputed author.

EUBULUS, a distinguished comic poet of the middle comedy, was a native of Athens, where he flourished about B.C. 370–80. He is said to have written no fewer than 104 plays, of fifty of which the titles have been preserved by Suidas. The fragments of Eubulus that survive have been edited by Meineke, and serve to show, if nothing else, at least that his diction was remarkably pure and tasteful.

EUCHARIST (εὐχαριστία, *thanksgiving;* from εὖ, *well,* and χάρις, *favour*), the sacrament of the Lord's Supper; the solemn act of commemorating the death of our Redeemer, in the use of bread and wine as emblems of his flesh and blood. See SUPPER OF THE LORD.

EUCHOLOGIUM (εὐχή, *prayer;* λόγος, *a discourse*), literally *a discourse on prayer;* applied to the Greek ritual, in which are prescribed the order of ceremonies, sacraments, and ordinances. Gore has given an edition of the Greek euchologium in Greek and Latin, with notes.

EUCLASE, formerly called *prismatic emerald,* a very rare mineral of a pale green colour. See MINERALOGY.

EUCLID (EUCLIDES) OF ALEXANDRIA, author of the most ancient elements of geometry which have come down to us, and hence justly regarded as one of the fathers of science. He has been sometimes confounded with Euclid of Megara. The place of his birth is unknown. But Proclus Diadochus, one of his commentators, informs us that he opened a school of mathematics in Alexandria in the reign of Ptolemy the son of Lagus; and Pappus extols his kindness and affection for those who laboured to advance the study of geometry. This being all that is known of the life and character of Euclid, it only remains therefore to speak of his works, some of which have been lost. Amongst those which we possess, however, the most remarkable is that which is simply entitled *Elements,* as if to indicate that it contained the entire body of principles upon which the pure mathematics then rested. This work now consists of fifteen books; but the last two are attributed to Hypsicles, a mathematician of Alexandria who flourished at a later period. Euclid, however, neither was nor could be the inventor of all that is contained in his work; for geometers more ancient than he, including Hippocrates of Chio, had written Elements; but, on the other hand, there can be little doubt that he added to the pre-existing stock of elementary truths, improved the demonstrations in which his predecessors had failed, and composed a whole which, by more severe forms of reasoning, and a more exact concatenation of propositions, superseded all works of the same description which had been previously written, and became the basis of instruction in the mathematics. These *Elements* were first commented on by Theon, and by Proclus; but whatever success such commentaries may have had in the school of Alexandria, they remained wholly unknown to the occidentals of the middle ages, who derived all their knowledge of geometry, such as it was, from the works of Boethius, and from a production entitled *De Principiis Geometriæ,* ascribed to St Augustin.[1] It was only in the twelfth and thireenth centuries that Athelard in England and Campano in Italy laboured to decipher and translate Euclid from the Arabic versions, including the commentary of the Persian geometer Nazir-Eddin, which was held in great estimation among the Saracens; for although there is reason to believe that Boethius had made a complete Latin translation of Euclid, it has not come down to our times; and, in fact, it was not till long after the revival of letters, and when versions had been multiplied by means of the press, that a part of the *Elements* of Euclid was introduced into the course of instruction in the schools. In order to form an idea of the entire work, however, it may be considered as composed of four parts. The first of these parts comprehends the first six books, and may be divided into three sections, viz., the demonstration of the properties of plane figures treated in an absolute manner, as in books first, second, third, and fourth; the theory of the proportions of quantities in general, which is the object of the fifth; and the application of this theory to plane figures, as in book sixth. The second part contains the seventh, eighth, and ninth books, which are denominated *arithmetical,* because they treat of the general properties of numbers. The third part consists only of the tenth book, in which the author considers in detail incommensurable quantities, and which he terminates by proving that the diagonal of a square and its side cannot have a common measure; a doctrine, we may add, which is

[1] Montucla, *Histoire des Mathématiques,* tom. i., pp. 212 and 492.

much more ancient than Euclid, since Plato, towards the close of his seventh book of *Laws*, pronounces those who have no idea of such incommensurability as sunk in almost brutish ignorance. The fourth part, which is composed of the last five books, treats of planes and solids. But of all this great body of geometrical doctrine, the only portions which have been considered as adapted to the purposes of instruction are the first six books, together with the eleventh and the twelfth; the propositions which they contain having formed the basis of all the elements of geometry which, under whatever form, have from time to time been given to the world. The fifth book, however, has often been omitted in such publications, because the notation of our arithmetic, and still more that of our algebra, have greatly simplified the theory of proportions; and, for the same reason, the other arithmetical books, which it is now difficult to read, are justly considered as more curious than useful. But, in borrowing their materials from the work of Euclid, modern authors have frequently altered the arrangement; and on this subject there have arisen two contradictory opinions, which have been debated with very great warmth, yet still remain as irreconcilable as ever. The concatenation established by Euclid, and even the forms which he has employed in demonstrating his propositions, are regarded by some as almost the last term of perfection in works of this kind; whilst others, again, have considered these as mere essays, which, however excellent in themselves, leave room for the introduction of a more natural order and more simple demonstrations. Ramus, who declared war on the dialectics of Aristotle, accuses Euclid of omissions and redundancies, and expresses his conviction that it was with reference to these imperfections that Ptolemy inquired if there were not a more easy method than that usually employed for learning geometry; an inquiry which, as is well known, elicited from Euclid the reply, that in the mathematics there was no road for kings. Antony Arnauld, and the author of the Port-Royal Logic, have also blamed the order followed by the Greek geometer, and disputed some of his definitions;[1] but if Arnauld, either from not being very profound in the mathematics, or by reason of the great difficulty of the subject, failed, as Ramus and so many others had done, in the changes which he attempted to introduce into the *Elements*, his reasons for making the attempt still remain in all their force. For, whatever may be said to the contrary, it is certain that they are deficient in that order which, causing the propositions, as far as possible, to arise out of one another, exhibits in full evidence the analogies which connect them, assists the memory, and prepares the mind for the investigation of truth. But whether, in the actual state of the science, it be practicable to reconcile this order with the rigour of demonstration, or to obviate objections the force of which, abstractedly considered, cannot be disputed, is a question which it would far exceed the limits of this notice to discuss.[2] If it be resolved affirmatively, which appears to us possible, then no reason would exist for giving an absolute preference to the *Elements* of Euclid. As a precious relic of antiquity, and as one of those works of science which time has thrown least in arrear of actual knowledge, the *Elements* would doubtless continue to be classed in the first rank of mathematical productions; but their too arbitrary arrangement, and the style in which they are written, sometimes too prolix, and at other times too concise, would no longer constitute the essential character of the geometric or synthetic method, in opposition to the analysis of the moderns. The true difference of these two methods of treating the science of quantities consists in this, that the one is founded on the immediate consideration of the properties of figures, whilst the other employs arbitrary signs, combined by the operations of calculation. The first is geometry itself, not that of Euclid more than of any other; the second is an application of algebra, which ought not to be confounded with analysis, inasmuch as synthesis may be effected with algebraic signs as well as with the figures of geometry. The latter, however, which may also be treated analytically, presents operations equivalent to the resolution of certain equations. Of this some propositions contained in the book of *Data* are remarkable examples; propositions which, by a natural and certain path, lead to the solution of problems otherwise undiscoverable. The book of *Data* was particularly relished by Newton, who, persuaded that a proposition scarcely deserved to see the light unless it could be demonstrated without the assistance of calculation, conceived that a more profound study of this treatise would have enabled him to dispense with the aid of such an instrument. But it may well be doubted, to say nothing more, whether his successors, by pursuing a similar path, would have ever attained those great and striking results which they have derived from the new methods of calculation.

Besides the *Elements* and the *Data*, which are the most important works of Euclid, Pappus and Proclus mention the following: *Introductio Harmonica, Sectio Canonis*, relating to music; *Phænomena*, containing an exposition of the appearances produced by the motion attributed to the celestial sphere, a work subjoined to the book *De Sphæra Mobili* of Autolycus; *Optica, Catoptrica*, concerning direct vision and mirrors; *Liber de Divisionibus*, treating of the divisions of polygons; and the lost works, entitled *Porismatum libri, Locorum ad superficiem libri, Fallaciarum liber*, and *Conicorum libri*. At the end of the works of Euclid is a short fragment entitled *De Levi et Ponderoso*, the author of which is unknown; it is, however, of almost no value. The editions of the works of this geometer are so numerous that we cannot undertake to indicate all of them, and must therefore confine ourselves to the principal ones. Of the complete works there are, 1. *Euclidis Opera, Græce, cum Theonis expositione, cura Grynæi*, Bâle, 1530, in fol.; 2. *Euclidis quæ supersunt omnia, ex recensione Davidis Gregorii, Græce et Latine*, Oxford, 1703, in fol.; 3. *Les Œuvres d'Euclide, en Grec, en Latin, et en Français, d'après un Manuscrit très ancien, qui était resté inconnu jusqu' à nos jours* par Peyrard, Paris, 1814, in 8vo. The manuscript here referred to was one of several sent from Rome by Monge, and supposed to date from the end of the ninth century: in it the *Data* are placed immediately after the thirteenth book, and thus separate from the rest of the work the fourteenth and fifteenth books, which are ascribed to Hypsicles. In 1533, Hervage published at Bâle, in folio, a complete edition of the *Elements*, in the Greek text, with the exposition of Theon, and the Commentaries of Proclus on the first book. The following are the principal Latin translations: *Præclarissimum Opus Elementorum Euclidis perspicacissimi in artem Geometriæ*, the first publication of the *Elements* by means of printing, Venice, 1482; *Euclidis Elementorum libri XV. una cum scholiis antiquis, a Frederico Commandino Urbinate in Latinum conversi, Commentariis quibusdam illustrati*, Pesaro, 1572, in fol.; *Euclidis Elementorum libri XV. demonstrationibus accuratisque scholiis illustrati, auctore Christophoro Clavio*, 1574, in 8vo; *Euclidis Elementorum libri XV. breviter demonstrati, opera I. Barrow*, London, 1678, in 8vo; *Elementorum Euclidis libri XV. ad Græci contextûs fidem recensiti et ad usum tyronum accommodati, edente Baermann*, Leipzig, 1769, in 8vo; *Euclide Megarense philosopho, solo introduttore delle scientie mathematiche diligentemente reassettato per Nicolo Tartaleo Brisciano*. This last, however, is rather a paraphrase than a translation. There are many other editions which only contain part of the *Elements*: but for further details see Murhard, *Bibliotheca Mathematica* (tom. ii. pp. 1–48), and other similar works. We have not thought it necessary to notice the more recent editions of the *Elements*, which are in the hands of every body. See also GENERAL INDEX. (J. B—E.)

EUCLIDES, a disciple of Socrates, who, after the death of that philosopher, retired to Megara, where he founded a school of philosophy. We know very little of his principles except in so far as they stand related to the sceptical school of a later period. His followers were generally distinguished by their dialectic subtlety; and as a consequent of this they

[1] See *Nouveaux Elémens de la Géométrie*, and the Fourth Part of the *Logique Port-Royal*.

[2] Lacroix, *Essais sur l'Enseignement en général, et sur celui des Mathématiques en particulier*, Paris, 1805.

found themselves speedily reduced to universal doubt. The philosophy of Euclid was expounded in six dialogues, which are now lost.

EUDEMUS, a disciple and contemporary of Aristotle, was a native of Rhodes. His importance in the history of philosophy may be judged from the fact, that after his master he and Theophrastus were regarded as the only worthy exponents of that great thinker's doctrines. He was himself the author of some works on the Categories, on Physics, and on Analytics, which have all perished, but his fame rests chiefly on his editorial comments upon Aristotle. So closely has he followed out his master's system, that some of Aristotle's works have, in modern times, been attributed bodily to him. Certain it is, that to him we are indebted for a valuable portion of that philosopher's work on Physics, left imperfect and incomplete by his death; and it is also not unlikely that he bore a principal share in the editing and arrangement of his Ethics. No details of Eudemus' personal history have come down to us.

EUDIOMETER (εὐδία *pure air*, and μέτρον *a measure*), the name of an instrument or of any apparatus subservient to the chemical analysis of the atmospheric air. The first instrument for this purpose was introduced under the idea that the salubrity of the atmosphere depended upon its relative quantity of oxygen; but it is now known that the amount is not subject to any appreciable fluctuation, but that atmospheric air, when it has perfect freedom of motion and mixture, contains in all situations 20 volumes of oxygen in 100. The practice of eudiometry has been extended to other gaseous mixtures, chiefly for the purpose of determining the amount of oxygen they contain. This method of analysis is described under CHEMISTRY, vol. vi., p. 464.

EUDOCIA, the celebrated wife of Theodosius II., was the daughter of the Athenian sophist Leontius, or Leon, and was called Athenais prior to her conversion to Christianity. By her father she was carefully instructed in literature and the sciences; and so high an estimate did the philosopher make of her beauty and merit, that he divided his whole patrimony between his two sons. Athenais, however, resented the injustice, and carried her plea to Constantinople before the emperor. Here she gained access to Pulcheria, the sister of Theodosius, and by her she was secretly destined to be his wife. Before her elevation to the throne, she renounced Paganism and was baptized. It was not, however, till the birth of a daughter that she received the title of Augusta (A.D. 423). Her brothers she not only forgave, but raised to the dignity of consuls and præfects. About A.D. 438, Eudocia made an ostentatious pilgrimage to the Holy Land, distributing alms and donations for pious purposes, with a munificence which exceeded that of the great Helena, and returned to Constantinople with the precious relics of St Stephen, St Peter, and the Virgin. Her peace, however, was soon after disturbed by the jealousy of her husband, who happened to receive from Paulinus, his master of the offices, a beautiful apple which he had presented to his wife. The execution of the favourite, and the retreat of Eudocia to the solitude of Jerusalem, did not appease the anger of the emperor, who despatched a messenger for the purpose of putting to death two ecclesiastics who had gained her confidence. The assassination of his envoy provoked the emperor still further, and Eudocia was stripped of her royal honours, and degraded in the eyes of the nation. Among the monks of Jerusalem she became infected with the Eutychian heresy; but the misfortunes of her daughter Eudoxia led her to obtain a reconciliation with Pulcheria, and through her influence and that of her brothers she was afterwards restored to the communion of the church. She died at Jerusalem about A.D. 460, and was buried in the church of St Stephen. With her latest breath she protested that she had never transgressed the bounds of innocence and friendship. The talents of Eudocia were especially in her later years devoted to the service of the church. She composed a paraphrase on the Octateuch in heroic verse, a paraphrase of Daniel and Zechariah, and a poem on the martyrdom of Cyprian and Justina. To these are added a poem on her husband's victory over the Persians, and, according to Zonaras, a cento of the verses of Homer applied to the life and miracles of Christ.

EUDOCIA was also the name of several other Roman empresses; the most notable was Eudocia Augusta of Macrembolis, wife of the Emperor Constantine XI., and after his death of Romanus IV. She had sworn to her first husband on his deathbed not to marry again, and had even imprisoned and exiled Romanus, who was suspected of aspiring to the throne. Perceiving, however, that she was not able unaided to avert the invasions which threatened the eastern frontier of her empire, she revoked her oath, married Romanus, and with his assistance dispelled the impending danger. She did not live very happily with her new husband, who was warlike and self-willed, and was ultimately compelled to vacate the throne in favour of her son Michael. She retired to a convent, where she died at an advanced age.

EUDOXIANS, a sect of heretics, also called Acacians, who held a middle position between the Arians and Semi-Arians. See ACACIANS.

EUDOXUS, a celebrated physical philosopher of antiquity, was a native of Cnidus, and flourished about the middle of the fourth century B.C. It is chiefly in his quality of astronomer that his name has descended to our times. What particular service he rendered to that science beyond introducing the Egyptian sphere into Greece, and correcting the length of the year, cannot now be ascertained. Of his personal history, it is only known that he studied at Athens under Plato, but being dismissed by that philosopher, passed over into Egypt, where he remained for sixteen months: that he then went to Cyzicum and the Propontis, where he taught physics, and ultimately migrated with a band of pupils to Athens, where he died in the fifty-third year of his age.

EUERGETES (*i. e.*, *well-doer*, or *benefactor*), a title of honour frequently conferred by the Greeks on those who had done the state some service. This title was also assumed by several of the Græco-Egyptian kings and others. The most notable of these kings to whom this name was applied was Ptolemy III., eldest son and successor of Ptolemy II. Philadelphus. Receiviug his hereditary dominions from his father in a high state of prosperity and civilization, he greatly enlarged their original boundaries by his conquests in Asia. He first invaded Syria, to punish the cruelty and misgovernment of his brother-in-law, Antiochus II., king of that country. Many Syrian cities voluntarily opened their gates to him, and he seems to have penetrated as far as Antioch without meeting any opposition. Here, instead of crossing the Taurus, he turned his arms eastwards, reduced Mesopotamia, Babylonia, and Susiana, and received the submission of the countries lying between these points and the confines of Asia. In the course of this expedition he recovered all the statues of the Egyptian gods which had been carried off by Cambyses, and by restoring these to their original temples, earned the gratitude of his subjects, who conferred upon him that title by which he is known in history as the benefactor of his people. On his return home he seems to have directed his chief attention to the internal administration of his kingdom, and to have turned his arms against the Ethiopian tribes on its southern frontier. He was no less careful than his father had been to protect and encourage letters. He added so much to the Alexandrian Library, that he is sometimes, though erroneously, reputed to have been its founder. After raising his kingdom to a pitch of power and prosperity such as it had never attained before, he died, B.C. 222, not with-

Eugene. out a suspicion of having been poisoned by his son, whose after career afforded only too good grounds for the rumour.

EUGANEAN HILLS, a range of hills of Venetian Lombardy, in the western part of the delegation of Padua. They extend for about 10 miles from N.W. to S.E., between the Bacchiglione, the Monselice canal, and the Bisato. The chain presents few points of great elevation, the highest being Mount Venda, 1920 feet above the level of the sea, which is well wooded and cultivated, and has some thermal springs, resorted to for bathing.

In ancient times a people known as the Euganei occupied, at one time, all the country lying between the Alps and the head of the Adriatic, part of which territory they were afterwards compelled by the Veneti to evacuate. They are believed to have been originally an independent and very powerful people; and even in the time of Pliny they continued to subsist, and are known to have enjoyed the Latin franchise. No light has yet been thrown upon the origin of the Euganei. Their name has given rise to the idea that they sprang from a Greek source, but it is more probable that they were an offshoot from some of the early Gallic invasions of Italy.

EUGENE, FRANÇOIS, commonly called PRINCE EUGENE OF SAVOY, one of the greatest generals of his time (since he preceded Frederic II., and Turenne had fallen before he became known as a commander), was born at Paris on the 18th October 1663. His father, Eugene Maurice, count of Soissons, was grandson of the Duke of Savoy, Charles Emmanuel I.; and his mother, Olympia Mancini, was niece of Cardinal Mazarin; but the latter having been implicated in the affair of the poisonings, was forced to take refuge in Brussels in order to avoid prosecution. Originally destined for the church, Eugene evinced but little taste for theology, and occupied himself much more in reading the lives of great warriors, and the narratives of their exploits, than in studying the works of the fathers. Nevertheless he was of a feeble constitution; and as he wore a dark cloak, he was known at court by the name of the Little Abbé. Louis XIV. refused him a company in a regiment of cavalry, because, according to some, he thought the young prince unfit for the profession of arms, whilst, according to others, this refusal was owing to the disgrace of his mother, and the hatred which Louvois bore to her. But however this may be, Eugene was so stung by the refusal, that, from the moment of his repulse, he conceived for the king and his minister that long and fatal resentment which at length caused so many evils to France.[1] Having quitted France in disgust, he proceeded to Vienna, where the Emperor Leopold, who was allied to his family, received him kindly, and granted him permission, along with several other Frenchmen of distinction, to serve against the Turks under the banners of Austria. His first campaign was that of 1683, during which his courage appeared so conspicuous that the emperor, by way of recompense, gave him a regiment of dragoons. After several other campaigns made with equal distinction, at the head of the same regiment, he became major-general; and it was in this capacity that he served at the siege of Belgrade in 1688. At the instigation of Louvois, a decree of banishment from France was now issued against all Frenchmen who should continue to serve in foreign armies. "I shall return into France in spite of him," said Eugene, when the news were communicated to him; and he continued to pursue with the same ardour the career on which he had entered in so brilliant a manner. In his case genius was stimulated by resentment. Eugene.

Leopold, considering him as not less fitted for diplomacy than for war, sent Eugene as his envoy or negotiator to the Duke of Savoy, in order, if possible, to detach that prince from his connection with France. Nor did the result disappoint the expectations of the emperor. Overcome by the pressing solicitations of his young cousin, the duke allowed himself to be drawn so precipitately into the coalition against France, that, without waiting for the succours which the court of Vienna had promised him, he imprudently gave battle to Catinat at Staffarde, and was defeated, notwithstanding the great courage which Prince Eugene there displayed at the head of a corps of cavalry. But the auxiliary force sent by Austria having at length arrived, Eugene assumed the command, and, after obtaining some advantages, which placed the Duke of Savoy in a condition to defend himself, he returned to Vienna, where he decided the emperor to send fresh reinforcements. The imperial forces were thus put in a condition to resume the offensive; and Prince Eugene having arrived to command them in the spring of 1691, he caused the siege of Coni to be raised, took possession of Carmagnole, and gloriously terminated the struggle in which he had found himself engaged with Catinat. It was, in fact, as much by his successes, as by the ascendency which his superior mind exercised over the Duke of Savoy, that he managed to retain that prince in the coalition, from which he was oftener than once on the eve of breaking off, in order to throw himself again into the arms of France. Desirous to attach him still more to its interests, however, the court of Vienna conferred upon him the title of generalissimo of its forces; and it was in this capacity that he penetrated into Dauphiné at the head of ten thousand men, having Prince Eugene as his lieutenant. The combined army took possession of Embrun and Gap; laid the whole country in ashes, by way of reprisals for the burning of the Palatinate; and was preparing to carry its ravages even into Provence and Languedoc, when the generalissimo having been seized with the small-pox, this accident saved the French provinces from further devastation. Prince Eugene led the army back into Piedmont, and it was there that he received the brevet of field-marshal. After a third campaign of little importance, the Duke of Savoy having again joined the French, and thus turned the balance against the Austrians, Prince Eugene returned to Vienna, where he was appointed to the command of the army of Hungary.

It was about this time that Louis XIV. secretly offered him the baton of a marshal of France, with the government of Champagne, which his father had held, and also a pension of two thousand pistoles. But Eugene rejected these offers with indignation, and proceeded to combat the Turks commanded by the grand signior Kara-Mustapha in person. After some able marches and skilful manœuvres, he surprised the enemy at Zenta, on the Teisse,

[1] "Quelques historiens, bons ou mauvais, se donneront peut-être la peine d'entrer dans les détails de ma jeunesse, dont je ne me souviens presque plus. Ils parleront sûrement de ma mère, un peu intriguante à la vérité, chassée de la cour, exilée de Paris, et soupçonnée, je crois, de sorcellerie, par des gens qui n'étaient pas de grands sorciers. Ils diront comment je suis né en France, et comment j'en suis sorti, la rage dans le cœur contre Louis XIV., qui m'a refusé une compagnie de cavalerie, parce que, disait-il, j'avais une complexion trop faible; et une abbaye, parce qu'il prétendait (sur je ne sais quels mauvais propos sur mon compte, ou fausses anecdotes de galerie de Versailles) que j'étais plus fait pour le plaisir que pour l'église. Il n'y a de Huguenot chassé par la révocation de l'édit de Nantes, qui lui ait conservé plus de haine. Aussi, quand Louvois, apprenant mon départ, dit, *Tant mieux, il ne rentra plus dans ce pays-ci*, je jurai bien de n'y rentrer que les armes à la main; j'ai tenu ma parole." (*Vie du Prince Eugene*, now known to be the production of the Prince de Ligne.)

in a camp retrenched *en tête-de-pont;* and, after an attack as vigorous as it was daring, he killed twenty thousand of them, drove ten thousand into the river, made prisoners of the remainder, and took the whole of their artillery and equipages. Never had a more complete and decisive victory been obtained by the imperial arms. But this splendid achievement, at the same time that it fixed upon Prince Eugene the eyes of all Europe, inflamed to the last degree the jealousy of his rivals, or rather enemies, of whom he had many at court, some of them not less powerful than vindictive. By means of their intrigues, these persons had caused an order to be sent the prince, commanding him to suspend all attack; and this order had reached him an instant before the battle commenced, but without changing his determination to assault the enemy's position; the opportunity for striking a blow was propitious, and he boldly resolved to profit by it. This act of disobedience to the orders of the sovereign was doubtless a fault, and he who dared to commit it would have been ruined without resource had he not triumphed in a manner the most complete and decisive. But was not such a fault gloriously effaced by a victory as useful as it was brilliant? So at least thought all the world, excepting the enemies of Prince Eugene, who succeeded in persuading the emperor that nothing could excuse his disobedience; and, accordingly, when the victorious general appeared before his master, under the impression no doubt that he was to be greeted with acknowledgments and felicitations, he met with a cold and severe reception. Nor did the folly and ingratitude of his enemies stop here. Next day he was placed under arrest, and ordered to deliver up his sword; and he was about to be brought before a council of war, when the inhabitants of Vienna interposed, loudly remonstrating against the injustice of such treatment. The emperor also, whether from fear or repentance, relented, and restored his command to Prince Eugene, who, however, accepted it only on the condition that he should have *carte blanche.* It is alleged that when the envoy of the emperor came to demand his sword, he replied, "There it is, still reeking with the blood of the enemy; I consent not to resume it except for the advantage of his majesty's service." But it is now proved that this pretended reply is spurious; for, as the Prince de Ligne well observes, "one half of the phrase would have been a gasconade, and the other a meanness," neither of which comported with the simple and manly character of this great warrior. Prince Eugene then returned to Hungary; and, after a campaign distinguished by no remarkable event, a treaty of peace was at length concluded with the Turks at Carlowitz, on the 26th January 1699.

Having returned to Vienna, the prince applied himself to the study of the arts, and particularly of history, which had always great attractions for him. But he was not permitted long to enjoy the leisure which he seemed so desirous to improve. The war of the succession, which soon broke out, opened to him a new field of glory; and at the commencement of the year 1701, he was sent into Italy once more to oppose his old antagonist Catinat. But all the prudence of the old general failed to secure him against the bold and incessantly-renewed enterprises of his young and indefatigable rival. The latter effected, in presence of the French army, the passage of the Adige, and forced it, after sustaining several checks, to retire behind the Oglio, where a series of reverses equally unexpected and severe led to the disgrace and retirement of Catinat. The Duke of Villeroi succeeded to the command of which Catinat had been deprived, and the prince had soon reason to felicitate himself on a change which, from its first announcement, transported him with joy. The presumptuous Villeroi having ventured to attack him at Chiari, in an inexpugnable position, Eugene repulsed all his efforts without difficulty, and inflicted a severe loss on the assailants. And this first check was only the forerunner of more signal reverses; for, in a short time, Villeroi was forced to abandon the whole of the Mantuan territory, and to take refuge in Cremona, where he seems to have considered himself as secure in the midst of his staff. But, by one of the most audacious enterprises which has ever been attempted in war, this place was surprised, and, had it not been for untoward accidents, would unquestionably have been carried. By means of a stratagem, Prince Eugene penetrated into the city during the night, at the head of a numerous body; and it was only owing to circumstances which could not possibly be foreseen or provided against, and particularly to the courage and vigilance of some French officers, that he found himself at length compelled to retire, carrying along with him Villeroi as a prisoner. But this last circumstance, so far from being an advantage to the Imperialists, proved the reverse; the Duke of Vendôme replaced the captive general, and his ability soon changed the aspect of affairs. From the first moment Prince Eugene appreciated the talents of his new adversary; and, besides, being aware of the superiority of the French army, with which the king of Spain in person had just effected a junction at the head of numerous reinforcements, he confined himself to a war of observation, without important results, though fertile in most useful lessons to students of military science. This campaign was terminated by the battle of Luzara, fought on the 1st of August 1702, in which each party claimed the victory. It was one of the most sanguinary ever delivered by Prince Eugene, whose fortune it was to command in so many battles; he there lost the flower of his army, and also his best officers, including the brave Commerci, his intimate friend and most faithful companion in arms.

Both armies having entered into winter quarters, Eugene returned to Vienna, where he was appointed president of the council of war. He then set out for Hungary in order to combat the insurgents in that country; but his means proving insufficient, he effected nothing of importance. The revolt was, however, put down by the success which General Heister obtained in another quarter. Prince Eugene accordingly proceeded to Bavaria, where, in 1704, he made his first campaign along with Marlborough. Similarity of tastes, views, and talents soon established between these two great men a friendship which is rarely to be found amongst military chiefs, and which contributed more than all other causes put together to the success which the allies obtained. The first and perhaps the most important of these successes was that of Hochsett or Blenheim, gained on the 13th of August 1704, where the English and imperial troops triumphed over one of the finest armies which France had as yet sent into Germany.

But since Prince Eugene had quitted Italy, Vendôme, who commanded the French army in that country, had obtained various successes. The Duke of Savoy, who had once more deserted France and joined Austria, had suffered severe losses; and the emperor having decided to send him assistance, Piedmont thus became the principal theatre of active hostilities. Having received orders to proceed thither without delay, Eugene quitted Marlborough with the most lively regret, though at the same time experiencing a secret satisfaction at the prospect of measuring himself with a rival in all respects worthy of him. Vendôme at first opposed great obstacles to the plan which the prince had formed for carrying succours into Piedmont; but after a variety of marches and countermarches, in which both commanders displayed signal ability, the two armies met at Cassano, where a murder-

ous engagement ensued, and Prince Eugene received two severe wounds, which forced him to quit the field. This accident decided the fate of the battle, and for the time suspended the prince's march towards Piedmont. But although prevented from effecting a junction with the Duke of Savoy, his operations failed not to prove advantageous to that prince, since the Duke de la Feuillade, then besieging Turin, was obliged to raise the siege and march to the assistance of Vendôme, who, notwithstanding his victory at Cassano, felt apprehensive of some new and daring enterprise on the part of his antagonist. Vendôme, however, was recalled, and La Feuillade was incapable of long arresting the progress of such a commander as Eugene. After once more passing several rivers in presence of the French army, and executing one of the most skilful and daring marches he had ever performed, the latter appeared before the entrenched camp at Turin, which place the French were now besieging with an army eighty thousand strong. Prince Eugene had only thirty thousand men; but his antagonist was the Duke of Orleans, who, though full of zeal and courage, wanted sufficient experience to enable him to contend with a man justly regarded as one of the greatest warriors of his time. Besides, by a secret order of Louis XIV., who had, in fact, transferred the command to Marsin, the young prince was restricted to the execution of an ill-conceived plan, which neutralized the advantage of superior numbers, and put it in the power of the enemy to select his point of attack. With equal courage and address, Eugene profited by the misunderstanding which the exhibition of such an order could not fail to produce between the French generals; and having on the 7th September 1706 attacked the French army in its entrenchments, he gained a complete victory, which decided the fate of Italy. This brilliant achievement, the result of the most masterly combinations, and, in several respects, the prototype of the campaign of Marengo in 1800, affords one of the most remarkable examples of the difficulty of defending extensive lines even against an inferior army, massed upon one or two points. As soon as the Duke of Orleans observed the imperial army approaching, he wished to march out of the lines with the whole French army, and to deliver battle in the open field, where he could have availed himself of his great numerical superiority (eighty thousand to thirty); but he was restrained by Marsin, who, by this absurd interposition, sealed the fate of the French army, and lost Italy. In the heat of the battle, which almost immediately ensued, Eugene received a wound, and was thrown from his horse into a ditch. His fall produced a belief that he was killed, and his soldiers began to lose courage; but he soon returned to the attack, and when the soldiers saw him appear in the midst of them covered with slime and blood, issuing his orders, and watching over every thing with the most admirable sang-froid, their enthusiasm was raised to the highest pitch; and from that moment the issue of the battle was certain. As a recompense for so important services, the prince received the government of the Milanese, of which he took possession with great pomp on the 16th April 1707.

The attempt which he made against Toulon, in the course of the same year, failed completely, because the invasion of the kingdom of Naples retarded the march of the troops which were to have been employed in it, and this delay afforded Marshal de Tessé time to make good dispositions. Obliged to renounce his project, therefore, the prince repaired to Vienna, where he was received with great enthusiasm both by the people and the court. "I am very well satisfied with you," said the emperor, "excepting on one point only, which is, that you expose yourself too much." This monarch immediately dispatched Eugene to Holland, and to the different courts of Germany, in order to forward the necessary preparations for the campaign of the following year, 1708.

Early in the spring of 1708 the prince proceeded to Flanders, in order to assume the command of the forces which his diplomatic ability had been mainly instrumental in assembling. This campaign was opened by the victory of Oudenarde, to which the perfect union of Marlborough and Eugene on the one hand, and the misunderstanding between Vendôme and the Duke of Burgundy on the other, seem to have equally contributed. This prince immediately abandoned the Low Countries, and remaining in observation, made no attempt whatever to raise the siege of Lille, where Boufflers distinguished himself by a glorious defence. To the valour of the latter Eugene paid the most marked and flattering homage, at the same time loading him with all those expressions of esteem and regard with which it was then usual, in such cases, to attemper the horrors of war. Boufflers was invited by his enemies to prepare the articles of capitulation himself, and Prince Eugene wrote to him, "I subscribe to every thing beforehand, well persuaded that you will not insert any thing unworthy of yourself or of me." After this important conquest, Eugene and Marlborough proceeded to the Hague, where they were received in the most flattering manner by the public, by the states-general, and, above all, by their esteemed friend the pensionary Heinsius. Negotiations were then opened for peace, but as the conditions proposed by the allies were considered by Louis XIV. as alike degrading to himself and to France, both parties made preparations for continuing the war.

The campaign of 1709 was opened in Flanders by two hostile armies, each a hundred and fifty thousand strong. That of the French was commanded by Villars, a man of considerable talents, but of little experience, and who feared to compromise himself in opposition to such great captains as Marlborough and Eugene. He accordingly remained upon the defensive, and suffered them to take Tournay without opposition; but being desirous of succouring Mons, he was followed by the allies, who attacked him at Malplaquet on the 9th of September, in a formidable position, where he had had time to entrench himself. The attack was made with equal vigour and ability; but owing to the strength of the French position, and the tenacity with which it was maintained, the victory was purchased at the cost of twenty-five thousand men killed on the field of battle, and the Dutch infantry was almost annihilated. The battle of Malplaquet was to it what the battle of Rocroi had been to the infantry of Spain; and it never afterwards recovered from the effects of that sanguinary day. Although the allies remained masters of the field of battle, this barren advantage had been so dearly bought, that they found themselves soon afterwards out of all condition to undertake any thing. Their army accordingly went into winter-quarters, and Prince Eugene returned to Vienna, whence the emperor almost immediately dispatched him to Berlin. From the king of Prussia the prince obtained every thing which he had been instructed to require; and having thus fulfilled his mission, he returned into Flanders, where, excepting the capture of Douay, Bethune, and Aire, the campaign of 1810 presented nothing remarkable. The emperor Joseph I. having died about this time, Prince Eugene, in concert with the empress, exerted his utmost endeavours to secure the crown to the archduke, who afterwards ascended the imperial throne under the name of Charles VI.

In the year following, 1711, the changes which had occurred in the policy, or rather the caprice, of Queen Anne, brought about an approximation between England and

France, and put an end to the influence which Marlborough had hitherto possessed with that princess. When this political revolution became known, Prince Eugene immediately repaired to London, charged with a mission from the emperor, and there made strenuous efforts to re-establish the credit of his illustrious companion in arms, as well as to re-attach England to the coalition. But all arguments and persuasions, whether founded on views of interest or sentiments of honour and consistency, having proved unavailing, the emperor found himself under the necessity of making the campaign of 1712 with the aid of the Dutch alone. The defection of the English, however, did not induce Prince Eugene to abandon his favourite plan of invading France. He had long been decided to make any sacrifice to accomplish this design, the conception of which originated as much, perhaps, in resentment as in a passion for glory. He therefore resolved, at whatever cost, to penetrate into Champagne; and in order to support his operations by the possession of some important places, he began by making himself master of Quesnoy. But the Dutch having been surprised and beaten in the lines of Denain, where Prince Eugene had placed them at too great a distance to receive timely support in case of an attack, he was obliged to raise the siege of Landrecies, and to abandon the project which he had so long cherished. This was the last campaign in which Austria acted in conjunction with her allies. Abandoned first by England and then by Holland, the emperor, notwithstanding these desertions, still wished to maintain the war in Germany; but the superiority of the French army prevented Eugene from relieving either Landau or Friburg, which were successively obliged to capitulate; and seeing the empire thus laid open to the armies of France, and even the hereditary states themselves exposed to invasion, the prince counselled his master to make peace. Sensible of the prudence of this advice, the emperor immediately entrusted Eugene with full powers to negotiate a treaty; and after some interviews, in which the prince and Villars interchanged expressions of esteem and admiration, there was concluded at Rastadt, on the 6th of March 1714, a peace which had long been anxiously looked for, and of which the nations of Europe had the greatest need.

After this happy event, Prince Eugene went to enjoy at Vienna some moments of repose. The emperor continued to show him marks of the most entire confidence; and from this time adopted no resolution, either in regard to the administration of the army, or that of the interior, without consulting him. But this kind of occupation did not suit the activity of Eugene; and although he was now advanced in years, his warlike humour had lost nothing of its vivacity. Sensible of the impossibility of Austria, situated as she was, resisting France, he had done all in his power to accelerate the conclusion of peace; but, by a contrary species of reasoning, he availed himself of a petty quarrel which the Ottoman Porte had with the Venetians to determine his master to espouse the cause of the latter. The emperor, having taken this step, appointed Eugene to command the army of Hungary; and at Peterwaradin, with a force not exceeding sixty thousand men, he gained a signal victory over the Turks, who had not less than a hundred and fifty thousand men in the field. This victory made a great noise in Europe, and all the Christian powers conceived themselves bound to rejoice on account of it. The pope sent to the victorious general the consecrated rapier, which the court of Rome was accustomed to bestow upon those who had triumphed over the infidels; and this extraordinary present was put into the hands of Prince Eugene by an envoy of his holiness. But the ensuing campaign, being that of 1717, was still more remarkable, on account of the battle of Belgrade. After having remained under the walls of that city, in a situation the most difficult imaginable; after having resisted, during a month, the efforts of a numerous garrison, as well as those of a hundred and fifty thousand Turks, with an army of only forty thousand men; and after having lost nearly the half of his troops by dysentery, and the fire of the Ottoman artillery, which plunged its shot even into his own tent; Prince Eugene gained one of the most complete victories of which there is any record or tradition, and soon afterwards forced Belgrade itself to capitulate. The attack which he ordered against forces six times more numerous than his own was really an act of despair. He had himself been seized with the cruel malady which was destroying his army, and all was consternation in the Austrian camp; yet at the very moment when he was believed to be on the eve of capitulating, he succeeded, by his constancy and daring courage, in obtaining a most decisive victory. The prince was wounded in the heat of the action, this being the thirteenth time that he had been hit upon the field of battle. On his return to Vienna he received numerous testimonies of gratitude, and, amongst others, a sword valued at eighty thousand florins, which was presented to him by the emperor. In the following year, 1718, after some fruitless negotiations with a view to the conclusion of peace, he again took the field; but the treaty of Passarowitz put an end to hostilities, at the moment when the prince had well-founded hopes of obtaining still more important successes than those which had illustrated the last campaign, and when he even flattered himself with reaching Constantinople, and dictating a peace on the shores of the Bosphorus. On his return to Vienna he was, as usual, received with every mark of esteem and admiration.

As the government of the Low Countries, formerly conferred upon Eugene, had now for some reason been bestowed on a sister of the emperor, the prince was appointed vicar-general of Italy, with a pension of three hundred thousand florins. From this time he occupied himself much more than he had ever done with the affairs of government; and Charles VI. habitually consulted him in all affairs of importance. He accompanied this monarch in several journeys, particularly to Prague, where Frederick I. of Prussia met the emperor by appointment, and testified the greatest admiration of the veteran warrior, by whom the latter was attended; and his influence seemed to be in all respects commensurate with his fame. During the ten years of peace which ensued, Eugene occupied himself with the arts and with literature, to which he had hitherto been able to devote little of his time. But the contest which arose out of the succession of Augustus II. to the throne of Poland having afforded Austria a pretext for attacking France, war was resolved on, contrary to the advice of Prince Eugene, whose last campaigns had taught him to dread the efforts of that power. Yet, although he had in the council declared his opinion in favour of peace, he was appointed to command the army destined to act upon the Rhine. This army, from the commencement, had very superior forces opposed to it; and if it could not prevent the capture of Philipsburg after a long siege, it at least prevented the enemy from entering Bavaria. Prince Eugene, having now attained his seventy-first year, no longer possessed the vigour and activity necessary for the command of armies; he himself perceived the change which time had wrought in his powers; and as he now longed for and required repose, he applied himself to bring about a peace, which was at length concluded on the 3d of March 1733. Having returned to Vienna, his health declined more and more, and he died in that capital on the 21st April 1736, leaving an

immense succession to his niece the Princess Victoria of Savoy.

Of a character cold and severe, Prince Eugene had almost no other passion than that of glory. He died unmarried, and without having ever evinced the slightest partiality for any woman, excepting, perhaps, the Countess de Bathiani, who, by the attractions of her wit and vivacity, appears to have consoled the last moments of his life. Although one of the greatest warriors of his time, military science is not indebted to him for any remarkable improvement. His operations were not directed according to any positive method, nor conformable to invariable principles; it was by sudden inspirations, and an admirable rapidity of *coup d'œil*, that he conducted himself on the ground according to the circumstances and the men with whom he had to deal; and upon all occasions he took the greatest pains to ascertain the character of the generals who were opposed to him. This system of tactics chiefly resembles that which we have seen displayed in the recent wars; it exhibits neither the prudence and circumspection of Turenne, nor the astonishing strategic ability of Frederick, in the difficult art of putting in motion and deploying columns and lines: it consists merely in an incessant activity and audacity, united with an admirable promptitude in perceiving and repairing faults. Despising the lives of his soldiers as much as he exposed his own, it was always by persevering efforts and great sacrifices that he obtained victory. To the Austrian armies he gave an eclat which they had never before possessed, and which, as it was reflected from his character alone, died with him; in fact, he could not sustain himself without efforts which wars so protracted and destructive rendered impossible upon the part of the people of Austria. This exhaustion, indeed, was long felt in the Austrian monarchy; and as that power has not had a single general since the time of Prince Eugene who can at all be compared with him, its armies have not subsequently been illustrated by any remarkable event, and the reputation of this general has consequently stood far above that of all other commanders in the imperial service. Prince Eugene, in truth, had a prevailing passion for war. Always on the march, in camps, or on the field of battle during more than fifty years, and under the reign of three emperors, he had scarcely passed two years together without fighting. It has been said that he loved letters and the arts; and the protection which he afforded to J. B. Rousseau has often been cited as a proof of this commendable taste. It is certain, indeed, that in his numerous expeditions, he had made an immense collection of objects interesting to science and art, as well as of valuable books and manuscripts; but it is evident that he never took time to examine them; and there is nothing to prove that he knew how to appreciate their value. He profited by war, which, in every point of view, prodigiously enriched him; and if he must be ranked with Turenne, Vendôme, and Catinat in regard to personal valour, he cannot be compared with them in point of disinterestedness and generosity. Prince Eugene was a man of the middle size, but, upon the whole, well made; the cast of his visage was somewhat long, his mouth moderate, and almost always open; his eyes were black and animated, and his complexion such as became a warrior. His funeral oration, composed in Italian by Cardinal Passionei, was translated into French by Madame du Boccage, 1759, in 12mo. But the most complete work on his life is the *Histoire du Prince Eugène*, Amsterdam, 1740, and Vienna, 1755, which was published anonymously, though it is now known to be the compilation of a M. de Mauvillon. It was from this production that the Prince de Ligne derived the greater part of the writing which he published in Germany in 1809, and which was twice printed the year following at Paris, under the title of *Vie du Prince Eugène de Savoie, écrite par lui-même*, in one vol. 8vo. There exists in German a history of Prince Eugene, which is little esteemed; and there was also published at Nuremberg, in 1738, a work entitled *Eugenius nummis illustratus*, which is of little value. But the Italian work on the Life and Campaigns of Prince Eugene, published at Naples in 1754, 8vo, is much more exact. We have also *Campagnes du Prince Eugène en Hongrie*, in 2 vols. 8vo; and *Histoire Militaire du Prince Eugene, du Duc de Marlborough, et du Prince de Nassau*, 2 vols. fol. by Dumont, and continued by Rousseau, Hague, 1729. The work of Father Ferrari, entitled *De Rebus Gestis Eugenii Principis Sabaudiæ, Bello Pannonico*, is much more remarkable for the purity of the style than for the accuracy of the facts. (J. B—E.)

EUGUBIAN, or Eugubine Tables, *Tabulæ Eugubinæ*, inscribed tablets in bronze, found in 1444 at La Schieggia, near Gubbio (*Eugubium*), in the duchy of Urbino. These tablets are seven in number, five of them containing inscriptions in Umbric, mixed with Etruscan, and the remaining two inscriptions in Latin characters. They were at first believed to be of very high antiquity; but it is now pretty generally agreed that they are not more ancient than the fourth century before the Christian era. The learned reader will find copies of these remarkable monuments in Dempster's *Etruria Regalis* (vol. i. p. 91, et seqq.), and also some curious details respecting them in the supplement to that work by the senator Buonarotti (vol. ii. p. 101). According to Lanzi, they refer entirely to the mode of sacrifice, the particular forms of prayer, and other religious rites of certain Umbrian communities, who were united in a sort of federal bond; but the explanations of the learned Italian are much too arbitrary and hypothetical to be of any authority; and, in point of fact, we are still as ignorant of the *language* of these inscriptions as when the tablets were first discovered, above four centuries ago. (See article Etruscans.) But as the character has proved less untractable than the text, an Etruscan alphabet has been constructed, by means of which we are enabled to read the words which as yet we cannot interpret. Previously to the time (1732) when Bourguet undertook this difficult task, several persons had attempted it, and failed. But, by carefully comparing the tablets in the Roman character with those in the Etruscan, the ingenious Frenchman discovered that the former were a compendium of the latter, and that many words were common to both sets; and, having obtained this key, he succeeded, by pursuing the comparison he had instituted, in constructing an alphabet which, though far from being complete, was yet much more perfect than any which had preceded it. Since the time of Bourguet, however, no further progress has been made in this confined but interesting field of inquiry; and as the language has hitherto baffled every artifice of interpretation, the contents of these curious monuments of antiquity still remain undeciphered. The discovery of a bilingual inscription, which is not an impossible event, would, however furnish the needful key, and lead directly to the solution of an enigma alike vexatious and interesting to the scholar. Should this ever happen, or should some rare effort of sagacity or miracle of fortune unexpectedly put any inquirer on the right road without such aid, we venture to prognosticate that the language of these inscriptions will be found to be radically Celtic, perhaps a dead dialect of that language, intermixed with terms of Pelasgic origin. That the Umbri were Celts, or at least of Celtic origin, there can be little doubt; and it seems equally certain that the Etruscans, who ultimately predominated over all the other tribes which from time to time had settled in

Etruria, were also, in part at least, of northern descent. It would therefore be strange indeed if in these inscriptions, five of which are in the Umbric mixed with the Etruscan character, no traces were found of that primitive language which successive immigrations from the north must have diffused over a considerable portion of the great plain of Italy. The Eugubine Tables were first published by Smetius, 1588; then by Gruter, *Inscript.* vol. i. p. 142. (Bourguet, Dempster, *De Etruria Regali;* and Lanzi, *Sag. di Ling. Etr.;* and Lassen, *Beit. zur Deut. der Eugub. Taf.* (J. B—E.)

EUHARMONIC. See Organ.

EULER, Leonard, professor of mathematics, member of the Imperial Academy of Petersburg, ancient director of the Royal Academy of Berlin, and fellow of the Royal Society of London, as also a corresponding member of the Royal Academy of Sciences at Paris, was born at Basil on the 15th of April 1707, of reputable parents. The years of his infancy were passed in a rural retreat at the village of Richen, of which place his father was minister. Being sent to the university of Basil, he attended regularly the different professors; and as his memory was prodigious, he performed his academical tasks with uncommon rapidity; but all the time he thus gained was consecrated to geometry, which soon became his favourite study. The early progress which he made in this science only gave new ardour to his application; and thus he obtained a distinguished place in the esteem of John Bernoulli, who was at that time one of the first mathematicians in Europe, as well as in the friendship of Daniel and Nicolas Bernoulli, who were already the rivals of their illustrious father. In 1723 Euler took his degree as master of arts, and delivered on that occasion a Latin discourse, in which he drew a comparison between the philosophy of Newton and the Cartesian system, which was received with the greatest applause. At his father's desire he afterwards applied himself to the study of theology and the oriental languages, and though these studies were foreign to his predominant propensity, his success was considerable; but, with his father's consent, he returned to geometry as his principal pursuit. He continued to avail himself of the counsels and instructions of John Bernoulli; he contracted, as already stated, an intimate friendship with his two sons, Daniel and Nicolas; and it was in consequence of these connexions that he became afterwards the principal ornament of the Academy of Petersburg. The project of erecting this academy, which had been formed by Peter the Great, was executed by Catherine I.; and the two young Bernoullis being invited to Petersburg in 1725, promised Euler, who was desirous of following them, that they would use their utmost endeavours to procure for him an advantageous settlement in that city. In the mean time, by their advice, he applied himself with ardour to the study of physiology, to which he made a happy application of his mathematical knowledge; and he also attended the medical lectures of the most eminent professors of Basil. This study, however, did not wholly engross his time, nor even relax the activity of his powerful and comprehensive mind in the cultivation of other branches of natural science. For whilst he was keenly engaged in physiological researches, he composed a dissertation on the nature and propagation of sound, and an answer to a prize-question concerning the masting of ships, to which the Academy of Sciences adjudged the *accessit,* or second rank, in the year 1727. From this latter discourse, and other circumstances, it appears that Euler had early embarked in the curious and important study of navigation, which he afterwards enriched with so many valuable discoveries.

Euler's merit would have given him an easy admission to honourable preferment, either in the magistracy or university of his native city, if both civil and academical honours had not been there distributed by lot. But chance having decided against him in regard to a certain situation to which he aspired, he left his country, set out for Petersburg, and was made joint professor with his countrymen Hermann and Daniel Bernoulli in the university of that city. At the commencement of his new career he enriched the academical collection with many memoirs, which excited a noble emulation between him and the Bernoullis; and this emulation always continued, without either degenerating into a selfish jealousy, or producing the least alteration in their friendship. It was at this time that he carried to a new degree of perfection the integral calculus, invented the calculation of sines, reduced analytical operations to a greater simplicity, and threw new light on all the parts of mathematical science. In 1730 he was promoted to the professorship of natural philosophy; and in 1733 he succeeded his friend Daniel Bernoulli in the mathematical chair. In 1735 a problem was proposed by the academy which required expedition, and for the solution of which several eminent mathematicians had demanded the space of some months. The problem was solved by Euler in three days, to the great astonishment of the academy; but the violent and laborious efforts it cost him threw him into a fever, which endangered his life, and deprived him of the use of his right eye. The Academy of Sciences at Paris, which in 1738 had adjudged the prize to his memoir concerning the nature and properties of fire, proposed for the year 1740 the important subject of the tides; a problem the solution of which required the most arduous calculations, and comprehended the theory of the solar system. Euler's discourse on this question was considered as a masterpiece of analysis and geometry; and it was more honourable for him to share the academical prize with such illustrious competitors as Colin Maclaurin and Daniel Bernoulli, than to have carried it away from rivals of inferior reputation. Rarely if ever did such a brilliant competition adorn the annals of the academy; and no subject, perhaps, proposed by that learned body, was ever treated with such accuracy of investigation and force of genius, as that which here displayed the philosophical powers of these three extraordinary men.

In the year 1741 Euler was invited to Berlin in order to augment the lustre of the academy which was there rising into fame. He enriched the last volume of the *Mélanges* or Miscellanies of Berlin with five memoirs, which make an eminent, perhaps the principal, figure in that collection; and these were followed, with an astonishing rapidity, by a great number of important researches, which are scattered throughout the memoirs of the Prussian academy, of which a volume was regularly published every year. The labours of Euler will appear more astonishing when it is considered, that whilst he was enriching the Academy of Berlin with a prodigious number of memoirs on the deepest parts of mathematical science, containing always some new views, often sublime truths, and sometimes discoveries of great importance, he did not discontinue his philosophical contributions to the Academy of Petersburg, which granted him a pension in 1742, and the memoirs of which display the marvellous fecundity of Euler's genius. It was with much difficulty that this great man obtained, in 1766, permission from the king of Prussia to return to Petersburg, where he desired to pass the remainder of his days. Soon after his return, which was graciously rewarded by the munificence of Catherine II., he was seized with a violent disorder, which terminated in the total loss of his sight. A cataract, having formed in his left eye, which had been essentially

damaged by a too ardent application to study, deprived him entirely of the use of that organ. It was in this distressing situation that he dictated to his servant, a tailor's apprentice, who was absolutely devoid of mathematical knowledge, his *Elements of Algebra;* which, by their intrinsical merit in point of perspicuity and method, and the unhappy circumstances in which they were composed, have excited equal applause and astonishment. This work, though purely elementary, discovers the characteristics of an inventive genius; and it is here alone that we meet with a complete theory of the analysis of Diophantus.

About this time Euler was honoured by the Academy of Sciences at Paris with the place of foreign member of that learned body; and after this, the academical prize was adjudged to three of his memoirs, *Concerning the Inequalities in the Motions of the Planets.* The two prize-questions proposed by the same academy for 1770 and 1772 were designed to obtain from the labours of astronomers a more perfect theory of the moon. Euler, assisted by his eldest son, was a competitor for these prizes, and obtained both. In this last memoir he reserved for further consideration several inequalities of the moon's motion, which he could not determine in his first theory, on account of the complicated calculations in which the method he then employed had engaged him. But he had the courage afterwards to review his whole theory, with the assistance of his son and Messrs Krafft and Lexell, and to pursue his researches until he had constructed the new tables, which appeared, together with the great work, in 1772. Instead of confining himself, as before, to the fruitless integration of three differential equations of the second degree, which are furnished by mathematical principles, he reduced them to the three ordinates, which determine the place of the moon; and he divided into classes all the inequalities of that planet, as far as they depend either on the elongation of the sun and moon, or upon the eccentricity, or the parallax, or the inclination of the lunar orbit. All these means of investigation, employed with such art and dexterity as could only be expected from analytical genius of the first order, were attended with the greatest success; and it is impossible to observe without admiration such immense calculations on the one hand, and on the other the ingenious methods employed by this great man to abridge them, and to facilitate their application to the real motion of the moon. But this admiration will become astonishment when we consider at what period and in what circumstances all this was effected. It was when he was totally blind, and consequently obliged to arrange all his computations by the sole powers of his memory and his genius; when he was embarrassed in his domestic circumstances by a dreadful fire, which had consumed the greater part of his substance, and forced him to quit a ruined house, every corner of which was known to him by a habit that in some measure supplied the place of sight;—it was in these circumstances, and under these privations, that Euler composed a work, which alone is sufficient to render his name immortal. The heroic patience and tranquillity of mind which he displayed need no eulogy here; and he derived them not only from the love of science, but from the power of religion. His philosophy was too genuine and sublime to stop its analysis at mechanical causes; it led him to that divine philosophy of religion which ennobles human nature, and is alone capable of forming a habit of true magnanimity and patience under suffering.

Some time after this the celebrated Wenzell, by couching the cataract, restored Euler's sight; but the satisfaction and joy which this successful operation produced were of short duration. Some instances of negligence on the part of his surgeons, and his own impatience to use an organ the cure of which was not complete, deprived him of vision a second time; and this relapse was accompanied with tormenting pain. With the assistance of his sons, and of Messrs Krafft and Lexell, however, he continued his labours; neither the loss of his sight nor the infirmities of an advanced age being sufficient to damp the ardour of his genius. Having engaged to furnish the Academy of Petersburg with as many memoirs as would be sufficient to complete its acts for twenty years after his death, he in the space of seven years transmitted to the academy above seventy memoirs, and left above two hundred more, which were revised and completed by the author of this notice. Such of the memoirs as were of ancient date were separated from the rest, and form a collection which was published in the year 1783, under the title of *Analytical Works.*

Euler's knowledge was more universal than could well be expected in one who had pursued with such unremitting ardour mathematics and astronomy as his favourite studies. He had made very considerable progress in medical, botanical, and chemical science; he was an excellent scholar, and possessed what is generally called erudition in a very high degree. He had read, with attention and taste, the most eminent writers of ancient Rome; the civil and literary history of all ages and all nations was familiar to him; and foreigners who were only acquainted with his works were astonished to find in the conversation of a man whose long life seemed to have been wholly occupied in mathematical and physical researches and discoveries, such an extensive acquaintance with the most interesting branches of literature. In this respect, no doubt, he was much indebted to an uncommon memory, which seemed to retain every idea that was conveyed to it, either from reading or meditation. He could repeat the Æneid of Virgil from the beginning to the end without hesitation, and indicate the first and last line of every page of the edition which he used.

But several attacks of vertigo, in the beginning of September 1783, which did not prevent his calculating the motions of the aerostatical globes, proved the forerunners of his mild and happy passage from this scene to a better. His death was sudden; he ceased to calculate and to live at nearly the same instant of time. Whilst he was amusing himself at tea with one of his grandchildren, he was struck with apoplexy, which terminated his illustrious career at the age of seventy-six. Euler, says Condorcet, was one of those men whose genius was equally capable of the greatest efforts and of the most continued labour; who multiplied his productions beyond what might have been expected from human strength, and who notwithstanding was original in each; whose head was always occupied, and his mind always calm. The nature of his pursuits, by withdrawing him from the world, preserved that simplicity of manners for which he was originally indebted to his character and his education; and he employed none of those means to which men of real merit have sometimes recourse in order to enhance the importance of their discoveries. It is true that fecundity such as his renders useless all the little calculations of self-love; but still great lucidity of mind and uprightness of character are necessary to trace, as he has done, the history of his thoughts, even when his investigations have proved fruitless, or the results disappointed the expectations which he had formed. Euler's constitution was uncommonly vigorous; his health was good; and the evening of his long life was serene, being sweetened by the fame which follows genius, the public esteem and respect which are never withheld from exemplary virtue, and several domestic comforts, which he was capable of feeling, and therefore deserved to enjoy.

The works which Euler published separately are, *Dissertatio physica de Sono*, Bâle, 1727, in 4to; *Mechanica, sive Motûs scientia, analytice exposita*, Petersb., 1736, in 2 vols. 4to; *Einleitung in die Arithmetik*, ibid. 1738, 2 vols. 8vo, in German and Russian; *Tentamen Novæ Theoriæ Musicæ*, ibid. 1739, in 4to; *Methodus inveniendi Lineas curvas, maximi minimive proprietate gaudentes*, Lausanne, 1744, in 4to; *Theoria motuum Planetarum et Cometarum*, Berlin, 1744, in 4to; *Beantwortung*, etc., or Answers to different Questions respecting Comets, ibid. 1744, in 8vo; *Neue Grundsætze*, etc., or New Principles of Artillery, translated from the English of Benjamin Robins, with notes and illustrations, ibid. 1745, in 8vo; *Opuscula varii argumenti*, ibid. 1746-51, in 3 vols. 4to; *Novæ et correctæ Tabulæ ad loca Lunæ computanda*, ibid. 1746, in 4to; *Tabulæ Astronomicæ Solis et Lunæ*, ibid. 4to; *Gedanken*, etc., or Thoughts on the Elements of Bodies, ibid. 4to; *Retung der Gottlichen Offenbarung*, etc., Defence of Divine Revelation against Freethinkers, ibid. 1747, in 4to; *Introductio in Analysin Infinitorum*, Lausanne, 1748, in 2 vols. 4to; *Scientia Navalis, seu Tractatus de construendis ac dirigendis Navibus*, Petersb. 1749, in 2 vols. 4to; *Theoria motûs Lunæ*, Berlin, 1753, in 4to; *Dissertatio de principio minimæ actionis, una cum examine Objectionum cl. prof. Kœnigii*, ibid. 1753, in 8vo; *Institutiones Calculi Differentialis, cum ejus usu in analysi Infinitorum ac doctrina Serierum*, ibid. 1755, in 4to; *Constructio Lentium Objectivarum*, etc., Petersb. 1762, in 4to; *Theoria motûs Corporum solidorum seu rigidorum*, Rostoch, 1765, in 4to; *Institutiones Calculi Integralis*, Petersb. 1768–1770, in 3 vols. 4to; *Lettres à une Princesse d' Allemagne sur quelques sujets de Physique, et Philosophie*, Petersb. 1768–1772, in 3 vols. 8vo; *Anleitung zur Algebra*, or Introduction to Algebra, ibid. 1770, in 8vo; *Dioptrica*, ibid. 1767–1771, in 3 vols. 4to; *Theoria motuum Lunæ nova methodo pertractata*, ibid. 1772, in 4to; *Novæ Tabulæ Lunares*, ibid. in 8vo; *Théorie complète de la construction et de la manœuvre des Vaisseaux*, ibid. 1773, in 8vo; *Eclaircissements sur les établissements en faveur tant des Veuves que des Morts*, without a date; *Opuscula Analytica*, Petersb. 1783–1785, in 2 vols. 4to.

EULOGY, encomium, panegyric; praise bestowed on any one on account of his virtues, valuable qualities, or services. The French *éloge* is usually a kind of funeral oration in honour of a celebrated person, and generally embraces a biographical account of the deceased.

The word eulogy is derived from the Greek εὐλογία, which signifies literally *good speaking*, *praise*, or *panegyric;* and which in the New Testament is employed in the sense of *blessing*, and of *thanksgiving*, as also to denote a collection of alms for the poor brethren. Hence in the ancient Greek Church the term was applied to small pieces of bread which were blessed and distributed among such as had not yet communicated. The Latin Church too, for many ages, had a similar custom; and thence arose the use of the consecrated wafer. The same name was also applied to loaves or cakes brought to church by the faithful to have them blessed. Eventually the use of the term passed to mere presents made to a person without any benediction.

EUMENES, a native of Cardia, a city in the Thracian Chersonesus, was born B.C. 360 and died in 315. At a very early age he was employed as private secretary by Philip king of Macedonia, and on the death of that prince he was confirmed in office by Alexander. It was in this capacity that he accompanied that monarch into Asia; and so highly did Alexander esteem him that he gave him for wife Artonis the daughter of Artabazus. Upon the death of Alexander, the provinces and armies were divided amongst his generals, and the countries assigned to Eumenes were Cappadocia and Paphlagonia, with the sea-coast of Pontus as far as Trapezus; but as they were not yet subdued, Leonatus and Antigonus engaged to put him in possession. Antigonus, however, disregarded the orders of Perdiccas; and Leonatus, having in vain attempted to induce Eumenes to accompany him to the assistance of Antipater in Europe, made an unsuccessful attack on his life. Eumenes, however, escaped his vengeance and joined Perdiccas, who assisted him in taking possession of Cappadocia.

About this time Craterus and Antipater, having reduced Greece, determined to pass into Asia and overthrow the power of Perdiccas. The first blow was aimed at Cappadocia; and in the emergency Eumenes was appointed commander of all the forces in the neighbouring countries. But to this Neoptolemus, one of the generals, refused to submit; and being defeated by Eumenes, he fled to Antipater and Craterus. The presence of Antipater was required in Cilicia, and the army destined to act against Eumenes was therefore commanded by Craterus and Neoptolemus. They were, however, completely defeated; Neoptolemus was killed, and Craterus died of his wounds, 321 B.C. The Macedonians receiving intelligence of the defeat of two of their generals by one whom they considered a stranger, only a few days after the death of Perdiccas, the Macedonian chiefs condemned Eumenes to death, and charged Antipater and Antigonus with the execution of their order. Eumenes was at first successful, but being defeated through the treachery of one of his officers, he fled to Nora, a strong fortress on the confines of Cappadocia and Lycaonia. Here he made a successful resistance, and was afterwards appointed by Olympias to command the army against Antigonus, whose intentions could no longer be misunderstood. He gained a battle against his adversary, but unfortunately lost the baggage and women belonging to his Macedonian phalanx. Antigonus offered to restore them on condition that the soldiers would surrender Eumenes into his hands; and having induced them to comply with the base proposal, he put him to death, in the fortieth year of his age. (Plutarch, *Life of Eumenes;* Nepos; Diodor. Sic. xviii. 30.) See MACEDONIA, and PONTUS.

EUMENES I. and II., the names of two kings of Pergamus. See PERGAMUS.

EUMENIDES (strictly, *the gracious goddesses*), an euphemistic appellation of the Furies. See FURIES.

EUMOLPIDÆ (*Sweet-singers*), the family of the priests of Demeter at Athens and Eleusis. They are said to have been descended from Eumolpus, a Thracian warrior and bard, the son of Neptune and Chione. Having been thrown into the sea by his mother, he was rescued by Neptune and educated in Ethiopia, whence he was expelled along with Ismarus his son, and fled to the court of the Thracian king Tegyrius. From Thrace he found it necessary to escape to Eleusis, where having joined the Eleusinians in a war with Athens, he was slain in battle along with his two sons. According to another account, he lived to preside over the Eleusinian mysteries which had been communicated to him by the goddess; and being succeeded in office by his son, the sacred duties continued ever afterwards to be discharged by members of his family. As sacred officers the hierophant and his attendants were distinguished by a particular dress; and besides attending to the celebration of the mysteries they were also entrusted with the dispensation of that traditionary law which regulated the punishment of religious offences. Occasionally they offered up the public prayers of the nation, and at the command of the people they gave utterance to the public curse imprecated upon political offenders. See MYSTERIES, and ELEUSINIAN MYSTERIES.

EUNAPIUS, a Greek sophist and historian, born at Sardis A.D. 347. In his native city he studied under the sophist Chrysanthius; but afterwards went to Athens, where he became a favourite pupil of Proæresius. He was the author of two works, one entitled *Lives of the Sophists*, and the other consisting of a *Continuation of the History of Dexippus*. The former work is still extant, but of the latter only excerpts remain. Both are written in an extremely inflated style, and both display traces of the most bitter enmity against the Christians.

EUNOMIANS, an Arian sect, so called from being the followers of Eunomius of Dacora in Cappadocia. Their leader studied theology under Ætius, and after having been deacon of Eudoxius at Antioch, was raised to the bishopric of Cyzicus, A.D. 360. From Cyzicus he was banished to Chalcedon, and from Chalcedon he was again exiled to

Halmyris in Mœsia. He spent the last days of his life at Cæsaræa and Dacora, where he died at an advanced age, A.D. 394. As a religious sect his followers adopted the extreme tenets of Arianism, denying not only that the Son was of the same but also of similar essence with the Father. From this their distinctive doctrine they were called Anomoians, in opposition to the Homousians or orthodox, and Homoiousians or semi-Arian party. (See ARIUS.) The works of Eunomius consist of a *Commentary on the Epistle to the Romans; an Exposition of Faith; a Defence of his Doctrine; and Epistles.* His defence is translated by Whiston in *Eunomianismus Redivivus.*

EUNUCH (εὐνοῦχος), an emasculated person. It appears from a law of Moses that the practice of emasculation was prior even to his time. (See Levit. xxi. 20; Deut. xxiii. 1.) From the remotest antiquity among the Orientals, as also at a later period in Greece, eunuchs were employed to take charge of the women, or, generally, as *chamberlains;* whence the name, οἱ την εὐνην ἔχοντες, *i. e.* those who have charge of the bedchamber. Their position in the harems of princes affording them the ready means of access to the royal person, it is not surprising that they were frequently enabled to exercise an important influence over princes, and even to raise themselves to stations of great trust and power. Hence the term eunuch in Egypt came to be applied to any *court* officer, whether a castratus or not. The vulgar notion that eunuchs are necessarily deficient in courage and in intellectual vigour is amply refuted by history. We are told, for example, by Herodotus, that in Persia they were far from being objects of contempt, but were frequently promoted to the highest offices. Narses, the famous general under Justinian, was an eunuch: such also was Hermias, governor of Atarnea in Mysia, to whose manes the great Aristotle offered sacrifices, besides celebrating the praises of his patron and friend in a poem (still extant), addressed to *Virtue.* (See Lucian's dialogue entitled *Eunuchus.*) To multiply instances were superfluous: the capacity of this class of persons for public affairs is strikingly illustrated by the histories of Persia, India, and China; and we need only to allude to the power exercised by the eunuchs under the later Roman emperors.

In the Gospel of St Matthew (xix. 12) we read of persons "who have made themselves eunuchs for the kingdom of heaven's sake;" an expression which apparently is an hyperbolism descriptive of such as lived in voluntary abstinence (compare Matt. v. 29, 30). This passage has, however, received a literal interpretation from some, as exemplified in the celebrated case of Origen, who acted upon the injunction—"Let him who is capable of doing this do it." But this species of extravagance was at its height in the second century, when there arose a sect called Eunuchs, who not only emasculated themselves, but also all those who fell into their hands.

The effect of early emasculation upon the voice, and its tendency to promote increase of stature, are well known.

EUPATOR, a name assumed by some of the kings of Asia among whom the vast conquests of Alexander the Great were divided.

EUPATORIA, or KOZLOV. See CRIMEA.

EUPATRIDÆ, in *Antiquity,* a name given by Theseus to the nobility of Athens, as distinguished from the Geomori and Demiurgi. By the establishment of Theseus, the Eupatridæ had the right of choosing magistrates, teaching and dispensing the laws, and interpreting religious mysteries. In all other matters the whole city was reduced to an equality. The Geomori were either free landholders or simply husbandmen, and inferior to the Eupatridæ in point of fortune: the Demiurgi were artizans, and fell short of the Eupatridæ in number. See ATTICA, vol. iv., p. 193.

EUPEN, a frontier town of Rhenish Prussia, government of Aix-la-Chapelle, and 11 miles S.S.W. of the town of that name. It stands in a pleasant valley on the Vesdre, an affluent of the Meuse, and is one of the principal manufacturing towns of Prussia. The manufactures are chiefly fine woollen cloths and cassimeres. Pop. (1849) 12,573, principally descendants of French Protestants, who took refuge here subsequently to the revocation of the edict of Nantes.

EUPHEMISM (εὐφημεῖν, *to speak well of*), in *Rhetoric,* a figure in which a delicate word or expression is substituted for one that is harsh or offensive; as in the use of "departed" or "deceased" for "dead." Among the ancients the use of euphemisms was very frequent, arising from a superstitious dread of using certain words and phrases that were regarded as ominous or unlucky. Hence Horace's "*male ominatis parcere verbis.*" For the same reason the Furies were called by the Greeks *Eumenides, q.d.,* the *gracious ones.*

EUPHONY, an agreeable sound; a smooth and elegant enunciation of words. In *Grammar* it denotes a kind of figure by which a letter is altered or suppressed, in order to obviate harshness of sound.

EUPHORBIUM, the resinous concrete juice of several species of Euphorbia. This substance possesses very active qualities, being extremely acrid, violently purgative and emetic, and dangerously stimulant when it enters the nose in the form of dust. It is imported from Africa and several parts of India in *serons* (skin-bags), in small, hollow, forked pieces. See BOTANY, Nat. Ord. 195.

EUPHORBUS, a famous Trojan, son of Panthöus. He was the first who wounded Patroclus, but himself perished by the hand of Menelaus, who hung his shield as a trophy in the temple of Juno at Argos. Pythagoras is said to have affirmed that he was the transmigrated soul of Euphorbus, and that his soul recollected many of its previous warlike exploits. In proof of his assertion, he identified at first sight the shield of Euphorbus in the temple of Juno.

EUPHORION, a distinguished poet and grammarian, was the son of Polymnetus, and was born at Chalcis in Eubœa, B.C. 274. He studied philosophy under Lacydes and Prytanis, and poetry under Archebulus the Therean. After amassing great wealth, he retired (B.C. 221) to the court of Syria, and there assisted Antiochus the Great in forming the royal library at Antioch, which it was intended should rival that of Alexandria; and in this employment Euphorion died. Only a few fragments of his works have been preserved; but from the opinions expressed by ancient writers, it appears that the erudite character of his allusions rendered him so obscure that he was difficult to be understood, and that he was constantly in search of archaic and obsolete expressions. As late as the times of the Emperor Tiberius, the works of Euphorion were still sufficiently popular. The fragments have been edited by Meineke under the title *De Euphorionis Chalcidensis Vita et Scriptis,* &c. Gedani, 1823. See also Clinton's *Fasti Hellenici,* vol. ii. p. 511; Fabricius, *Bib. Græc.,* vol. i. p. 594; Heyne, *De Euphorione, et Excurs.* iii. *ad Virg. Eclog.* vi. 64, and *Excurs.* v. *ad Æn.* ii.

EUPHRANOR, a celebrated painter and statuary of Greece, was a native of Corinthia, but from his having practised his art and acquired his renown at Athens, he is always identified with the Athenian school. In sculpture he produced a great number of pieces, from colossal life figures to drinking cups. Of the finest of these, a figure of Paris, a beautiful copy now exists in the Museo Pio-Clementino. His principal pictorial work was extant in the time of Pausanias in one of the porches of the Ceramicus. It represented on one side of the wall the twelve gods, and on the other Theseus as the founder of the equal polity of Athens. Euphranor was also the author of some works on colour and proportion, which seem to have been the characteristic excellences of his own pieces.

EUPHRATES, the most considerable river of western Asia, is formed by the junction of two great streams rising in the mountains of Armenia, pashalic of Erzeroum, and uniting in about N. Lat. 39., E. Long. 39. The Frat or northern branch has its principal sources about 20 miles N.E. of the town of Erzeroum; and the Murad, on the north declivity of the Arghi-dagh mountains, 45 miles N.E. from the nearest point of lake Van. The Euphrates flows first to the south, but, being driven westward by the Anti-Taurus and Taurus mountains, it works its circuitous way through narrow passes and over cataracts, until, breaking through a defile formed by the eastern extremity of Mons Amanus (Alma-dagh) and the north-western extremity of Mons Taurus, it reaches the plain country not far from Samosata (Sumeisat). It then winds south and south-east, passing the north of Syria, and the north-east of Arabia Deserta, and at length, after many windings, unites with the Tigris, and thus united, finds its termination in the Persian Gulf. In conjunction with the Tigris, it forms the rich alluvial lands of Mesopotamia, over which it flows or is carried by canals, and thus diffuses abroad fertility and beauty. At Baghdad and Hillah (Babylon), the Euphrates and Tigris approach comparatively near to each other, but separate again, forming a kind of ample basin, till they finally become one at Kurnah. Although occasionally much more, the breadth of the Euphrates varies between 200 and 400 yards, but for a distance of 60 miles through the Lemlun marshes the main stream narrows to about 80 yards. The general depth of the Upper Euphrates exceeds 8 feet. In point of current it is for the most part a sluggish stream; for, except in the height of the flooded season, when its flow approaches 5 miles an hour, it varies from $2\frac{1}{4}$ to $3\frac{1}{2}$, with a much larger portion of its course under 3 than above. Its general description for some distance below Erzingan is that of a river of the first order, struggling through high hills, or rather low mountains, making an exceedingly tortuous course, as it forces its way over a pebbly or rocky bed, from one natural barrier to another. As it winds round its numerous barriers, it carries occasionally towards each of the cardinal points a considerable body of water; and is shallow enough in some places for loaded camels to pass in autumn, the water rising to about $4\frac{1}{2}$ feet. The upper portion of the river is inclosed between two parallel ranges of hills, covered for the most part with high brushwood and timber of moderate size, having a succession of long narrow islands. The principal towns on its banks are Samsat, Haoroum, Romkala, Bir, Giaber, Deir, Rava, Anah, Hadisa, El Oos, Jibba, Hit, Hillah, Lemlun, Kurnah, and Basrah. The scenery above Hit, in itself very picturesque, is greatly heightened by the frequent recurrence of ancient irrigating aqueducts, beautiful specimens of art, which are attributed by the Arabs to the Persians when fire-worshippers: they literally cover both banks, and prove that the borders of the Euphrates were once thickly inhabited by a highly civilized people. From Hit to Babylon the black tent of the Bedouin is almost the only kind of habitation to be seen. This distance is cultivated only in part; the rest is desert, occasionally interspersed with clusters of date-trees. In descending, the irrigating cuts and canals become more frequent. Babylon is encircled by two streams, one above, the other below the principal ruins; beyond which they unite and produce abundance. For about thirty miles below Hillah both banks have numerous mud villages, shaded by date trees: to these succeed huts formed of bundles of reeds. The country lower down towards Lemlun is level and little elevated above the river; irrigation is therefore easy: in consequence, both banks are covered with productive cultivation, and fringed with a double and nearly continuous belt of luxuriant date-trees, extending down to the Persian Gulf. At one mile and a half above the town of Dewania is the first considerable offshoot from this hitherto majestic river; another takes place 22 miles lower; and nine miles farther—at Lemlun—it again separates into two branches, forming a delta not unlike that of Damietta, and when the river is swollen, inundating the country for a space of about 60 miles in width with a shallow sheet of water, forming the Lemlun marshes, nearly the whole of which is covered with rice and other grain when the river recedes (in June). Below Lemlun the Tigris sends a branch to the Euphrates, which is thus increased in its volume; and turning to the east, receives the chief branch of the Tigris, thence running in a single stream, under the name of the Shat-el-Arab, as far as the Persian Gulf. In this last part the river has a depth of from 3 to 5 fathoms, varies in breadth from 500 to 900 yards, and presents banks covered with villages and cultivation, having an appearance at once imposing and majestic. The length of the entire stream is 1400 miles. It is very abundant in fish. The water is somewhat turbid; but, when purified, is pleasant and salubrious. The Arabians set a high value on it, and name it Morad Sou; that is, Water of Desire or Longing. The river begins to rise in March, and continues rising till the latter end of May. The consequent increase of its volume and rapidity is attributable to the early rains, which, falling in the Armenian mountains, swell its mountain tributaries; and also to the melting of the winter snows in these lofty regions. About the middle of October the Euphrates has reached its lowest ebb, and ceasing to decrease, becomes tranquil and sluggish.

The expedition sent out by the British government, under the direction of Colonel Chesney, navigated the Euphrates in 1836 from Bireh-jik to its estuary, a distance of 1117 miles; and besides throwing much light on a country then very imperfectly known to Europeans, proved that there exist no serious obstacles to the navigation of that river by moderate-sized steamers thus far; and even for 88 miles above Bireh-jik to Beles, an important station in a commercial point of view.

The East India Company sent a small flotilla in 1841, under the command of Captain C. D. Campbell of their navy, to ascertain the navigability of the Euphrates. The expedition proved highly successful, having traversed the course of the stream for 1030 miles above its mouth. Mr Floyd, the surgeon of the flotilla, writing from Belis, June 6, 1841, says—"I am now near Aleppo, having completed the ascent of the Euphrates, without doubt one of the noblest rivers in Asia. Here, at a distance of a thousand miles from its embouchure in the Persian Gulf, it is 400 yards broad and very deep. The Euphrates differs very little from the Tigris up to Hilla, a Turkish Arab town, built near the site of ancient Babylon, except that its banks are much better cultivated, and in some the date-tree (the *Palma dactilifera*) adds to the picturesque meanderings of the river; while in others, a mosque, with its lackered dome rising from a group of willows, is a pleasing variety from the monotony of the surrounding district. The river is inclosed within a valley of high rocks, which extend from its source to below Hit. They are composed of gypsum, sandstone, and conglomerates, with mica and felspar. This climate is delightful, and produces all the varieties of European fruit, besides many of the tropical ones lower down the river. The only obstacle to the navigation consists in the remains of the water wheels used for irrigation. In the short space of 130 miles we found nearly 300 of these wheels, about one-third of which are in operation at the present day. They consist of large parapet walls built into the stream, directing the current of the river to the wheels, which are the most clumsy piece of mechanism, made of branches of trees, and have slung round them 150 clay vessels to raise the water in. The wheels are forty feet in diameter, placed at the end of an aqueduct raised upon well-built Gothic arches. It is surprising the quantity of water they raise to the surface. They cause a current of six or seven knots, with a fall of two or three

Eupolis || Eure.

feet where they are placed, so that the navigation of this part of the river is difficult and somewhat dangerous. The Tigris is now proved navigable to Mosul, the site of the ancient Nineveh; and the Euphrates to Baulus—I might say even to the heart of Taurus."

EUPOLIS, an Athenian poet of the old comedy, and in the judgment of Horace the greatest ornament of that school, was the son of Sosipolis, and was born B.C. 445. Nothing whatever is known of his personal history. With regard to his death, he is said to have been thrown into the sea by Alcibiades, who had suffered from his attacks. It is much more likely, however, and much more generally believed, that he fell at the battle either of Cynossema, B.C. 411, or of Ægospotami, B.C. 408. To a lively and fertile fancy Eupolis added a sound practical judgment, which prompted him to a thorough mastery of the mechanical part of his art. The result of his studies was that he was reputed to equal Aristophanes in the elegance and purity of his diction, and Cratinus in the command of the most bitter irony and pungent sarcasm. Very curious and complicated relations subsisted between Eupolis and Aristophanes, who accused each other with the bitterest virulence not only of imitation but of plagiarism. Some of these attacks will be found described in various parts of the Scholiæ upon Aristophanes. The plays of Eupolis are said to have numbered in all seventeen. Meineke gives the names of fifteen which he considers genuine, and an analysis of those whose subjects can be decided from the surviving fragments.

EUPOMPUS, one of the most celebrated of Greek painters, was a native of Sicyon, and a contemporary of Zeuxis and Parrhasius. He was the head of the Sicyonian school of art, and was held in very high esteem by his countrymen. When Lysippus the sculptor was beginning his career he consulted Eupompus as to whom he should take for his model. "Take nature herself for your model," replied Eupompus, "and be not shackled by the trammels of any predecessor." No mention is made of any piece of Eupompus except one—a victor in the games bearing a palm.

EURE, in the north of France, one of the five departments formed out of the old province of Normandy. It is bounded on the N. by the estuary of the Seine and the department of Seine-Inférieure, W. by Calvados, S. by Orne and Eure-et-Loir, and E. by Seine-et-Oise and Oise. It is sixty-five miles in length from E. to W., and its breadth varies from twenty-six to fifty-two miles, being between 48. 39. and 49. 29. N. Lat., and 0. 15. and 1. 45. E. Long. Area 2420 square miles. The surface is flat, with some ranges of low hills, none of them exceeding 300 feet in height. The three principal rivers by which it is watered are the Seine, the Eure, and the Rille. The Seine flows from S.E. to N.N.W. through this department, dividing it into two unequal parts. It afterwards touches the frontier at two or three points, and near its mouth forms part of the north boundary. The Eure, from which the department takes its name, rises in Orne, and flowing first east and then north, through Eure-et-Loir, falls into the Seine six miles below Louviers, after a course of ninety-three miles. The Rille likewise rises in Orne, and flows generally northward to its mouth in the estuary of the Seine. The climate is mild, but moist and variable. The soil is generally clayey, resting on a bed of chalk; but along the Seine there are some barren sandy tracts, quite incapable of cultivation. A great part of it, however, is very fertile and well cultivated. The chief kind of cereal cultivated is wheat, the growth of which occupies a larger space than rye, oats, and barley together. The quantity of grain produced is more than sufficient for the wants of the inhabitants. Flax is largely cultivated, and, from its length, fineness, and colour, is highly esteemed. Some hemp is also produced. The horses of the department, of the pure Norman breed, have always been celebrated, and, though they had nearly lost their high character, have of late been more carefully bred and much improved. The breed of cows is remarkably good; and the calves are much in request in the neighbouring departments. Sheep have been neglected, but have recently increased; and those on the coast, known as *Moutons du Pré Salé*, are highly valued for their excellent flesh. Of late years attempts have been made to improve the wool by a mixture of Merinos. Fruit is very abundant, especially apples, from which much cider is made. The vine is not much cultivated, cider being the principal beverage of the inhabitants.

Eure-et Loir.

This department abounds in iron ore, and is noted for its mining and manufacturing industry. Cotton, linen, and woollen cloths of every kind are fabricated. There are large establishments for making copper ware of all kinds, the various descriptions of paper, nails, pins, and needles, glass for windows and glass bottles, and jewellery and trinkets. These employments occupy the larger portion of the inhabitants. Such goods form the trade; in addition to which, fire-wood, timber, cattle, honey, wax, and corn are furnished to the district surrounding the department. Eure is divided into five arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Pop. in 1851.
Evreux	11	261	120,374
Louviers	5	116	68,859
Les Andelys	6	134	64,717
Bernay	6	140	77,222
Pont Audemer	8	140	84,625
	36	791	415,777

EURE-ET-LOIR, a department in the northern part of France, between N. Lat. 47. 57. and 48. 57., and E. Long. 0. 44. and 2. 0.; being 68 miles in length from N. to S., and varying in breadth from 36 to 56 miles. It is bounded on the N. by the department of Eure, N.E. by Seine-et-Oise, S.E. by Loiret, S. by Loir-et-Cher, and W. by Sarthe and Orne. It is formed out of portions of the old provinces of Orleanais, Maine, and Ile-de-France, and has an area of 2361 square miles.

Loir comprises four arrondissements, &c., as follows:—

Arrondissements.	Cantons.	Communes.	Pop. 1851.
Chartres	8	166	111,617
Châteaudun	5	80	65,185
Dreux	7	135	71,268
Nogent-le-Rotrou	4	54	46,922
	24	435	294,892

The surface is generally level, with a few eminences principally in the south and west, but none exceeding 500 feet in height. The principal rivers are the Eure towards the N., and the Loir in the S.; but neither of these is navigable within the department. Small lakes are numerous. The climate is temperate and healthy, and not subject to sudden changes. The soil in the middle and west of the department is the best. It consists, for the most part, of thick layers of gray, yellow, or black clay, intermixed with sand, or of calcareous earth, and is on the whole fertile; but in the S.W., especially in the arrondissement of Nogent, it is sandy and dry, and many tracts of land are so poor as to be uncultivated. The agriculture is better conducted than in most of the departments of France; and the production of the various kinds of corn far exceeds the consumption, great quantities of grain being sent annually to Paris and other places. The wheat is remarkably fine, and is prized on account of its being easily preserved for a long time, and being well adapted for sea voyages. The cows are small, but yield good butter for the supply of Paris, and fat oxen and calves for the markets of Poissy and Sceaux. The sheep are numerous, but not remarkable, except some flocks whose wool has been improved by crosses with the Merino races. Wine is not extensively produced, nor of the best quality; but in some parts there is an abundant supply of apples, from which cider is made as the common drink of the inhabitants.

There are some iron mines, and granite, marble, and gypsum quarries. The manufactures are not extensive; but leather, paper, cotton goods of various kinds, serges, flannels, and other coarse woollens, hosiery, hats, caps, household linen, such as sheetings and table linen, and some earthenware, are furnished. The department draws its supply of fuel from its own woods, which cover about one-twelfth part of the whole surface.

EURIPIDES, one of the most celebrated of the tragic poets of ancient Greece, was the son of Mnesarchus and Clito. The place, as well as the date, of his birth has been a subject of considerable dispute among scholars. By some authorities he is said to have been born at Athens, B.C. 485, and to have belonged to the Phlyan demi of the Cecropid tribe; and in this opinion they are borne out by the testimony of the Arundel marbles. Others, again, maintain, that in the second Persian invasion the parents of Euripides were in the number of those who, on the approach of Xerxes, fled from Athens and took refuge in Salamis; and that the future poet was born there on the very day that the great naval battle was fought and won by his countrymen, B.C. 480. This fact is pretty well authenticated, though it is somewhat suspicious that the Athenians were careful to identify their three great tragic poets with the most brilliant day in the annals of their history. Æschylus, they said, at this time in the vigour of manhood, took part in the engagement; Sophocles, a boy of fifteen, was one of the choir which celebrated the exploits of the victors at the festival given after the battle; and Euripides was born while the action was still undecided. If the authority of Eratosthenes be admitted, who assigns the death of Euripides to the year 406 B.C., at which time he had reached his seventy-fifth year, the poet must have been born B.C. 481; and this date is adopted by Müller as the true one. It is almost equally difficult to discover the real social status of the poet's parents. It is said that his father Mnesarchus was an expatriated Theban; and Aristophanes, one of his bitterest enemies, asserts that his mother was a vendor of herbs, and a dishonest one, besides. These accounts may be safely rejected as false; but it is only inferentially that an approximation to the truth can be made. At the Thargalian festival he is known to have acted as cup-bearer to a chorus of noble Athenians engaged in its celebration; and as none but youths of good rank and family were admitted to this honour, it may be inferred that Euripides' origin was far from mean. His education also was entrusted to such masters as were highest in repute at that time in Athens; among others, it is said, to Prodicus, the fortune-hunting rhetorician of Ceos, who prided himself on having for his pupils none but the sons of noble families, or such at least as could afford to pay the exorbitant sums which he demanded for his instructions. In the gymnastic and other bodily exercises, then much in vogue in Greece, Euripides was at an early age trained with the greatest care. An oracle had declared that he would be crowned with sacred garlands, and much of the poet's youth was spent in the gymnasium with a view to distinction in athletic sports. At the early age of seventeen he offered himself as a competitor in the Olympic games, having already gained prizes at the Eleusinian and Thesean festivals. From some formal irregularity, however, he was not allowed to compete. To this early training is to be attributed that knowledge of athletic sports which the poet displays in his works, and which has been especially remarked (see Keble's *Academic Prelections*, p. 605) in his account of the combat between Eteocles and Polynices. Abandoning these pursuits, he betook himself at the age of eighteen to the study of painting, in which he attained a respectable, though not a remarkable, proficiency. Soon finding, however, that pictorial art was not his sphere, he devoted himself to literature, continuing his philosophical studies under the guidance of Anaxagoras, the influence of whose doctrines is traceable in many portions of Euripides' works, and was especially apparent in the lost tragedy of *Melanippus the Wise*. While still in his eighteenth year he made his first essay as a tragic author, though it is not known with certainty either that the tragedy was one of those that have descended to us, or that it was played in the theatre at all. Hartung conjectures, though on insufficient grounds, that the drama in question was the *Rhesus*, and that it was publicly produced. The first that we know with certainty to have been played under the poet's own name was the *Peliades*, which appeared B.C. 455. Fourteen years after this date, B.C. 441, Euripides gained the first prize for the first time. Though persecuted with unrelenting bitterness during the whole period of his sojourn at Athens, and exposed to the merciless sarcasm and satire of the devotees of the elder tragic school, he contested the palm sometimes successfully with Sophocles, the greatest of its living representatives, till the year 408. Worn out at length by age, the rancour of the small wits of the day, and, it is said, the unhappiness of his domestic relations, he retired in that year to the court of Archelaus, king of Macedon, by whom he was treated during the remainder of his life with the utmost courtesy and kindness. He did not live long, however, to enjoy the honours paid him by his royal friend, as he died two years after leaving his native city, B.C. 406. No sooner had the poet breathed his last than his countrymen, obeying the usual law of nature so well propounded by Horace, that

> Virtutem incolumem odimus
> Sublatam ex oculis quærimus invidi,

instantly recognised the greatness of their loss, and sought to bestow upon the poet's ashes the honours which they had always denied to himself during his lifetime. They implored the Macedonians to restore his bones, that they might rest in his native land; but that people, who had already buried him with splendid obsequies, and erected a sumptuous monument in his honour at Pella, refused to comply, and the Athenians had to content themselves with a cenotaph. So great was the grief of his life-long rival Sophocles for his death, that at the representation of his next play he made his actors play their parts uncrowned. The statue of the deceased poet was set up in the theatre, and a monument erected to his memory on the road leading from Athens to the Piræus. His fame abroad was so great, that, as Xenophon records, many of his countrymen who fell into the hands of their enemies on the disastrous expedition against Sicily were released by their masters when it was discovered that they could repeat many of the verses of the illustrious tragedian. On another occasion a knowledge of Euripides stood some of his countrymen in good stead. An Athenian ship, pursued by pirates, had directed its course for Caunus; but the inhabitants of that town refused to admit it within its port, until it was discovered that some of the crew were familiar with the heart-reaching passages in the dramas of their newly deceased countryman.

Many stories are to be found in the ancient writers concerning the worthlessness of Euripides' moral character; but they rest on such doubtful authority, and are in their own nature so ridiculous, as to carry their refutation on their very face. It is said, for instance, that he was guilty of bigamy, though in his relations to the sex he is known to have been one of the most austere of men; and even the manner of his death has been distorted so as to countenance this slander. The received account is, that he was torn to pieces by the hounds of king Archelaus, which it is said were set upon him by two envious rivals whom he had eclipsed in the good opinion of that monarch. The scandal-mongers of the day, however, declared that he met his death at the hands of some women while on his way to a criminal assignation. He must have been vicious, indeed, if, at the age of seventy-five, he indulged in practices generally believed to characterize the

hot season of youth. It is not improbable that these reports owed their origin to the severity and even gloom of his disposition. These qualities were remarkably prominent in the character of his teacher Anaxagoras, and it is likely that, along with the doctrines of that philosopher, Euripides imbibed a good share of his moral attributes. The stories of his hatred of women are in reality as devoid of foundation as those which insist upon his personal profligacy. Certain it is, that whatever his personal predilections were in reference to the fair sex, his artistic tendencies led him to devote much time and minute observation to the study of female character. No poet of ancient or modern times, Shakspeare alone excepted, had a keener eye for the delicate and subtle phases of the female mind in all its moods; and it is hard to think that the author of such fine conceptions as *Alcestis* and *Iphigenia* should have been the victim either of unrequited love or (as has been alleged) of conjugal infidelity, while his native city abounded with the noblest archetypes of female character, which, under names supplied by the old mythology, he delighted to observe and portray.

Though it would be extremely unjust to rank Euripides among the atheists of antiquity, it is nevertheless true that in his ideas of the world and a future state he adopted the doctrines of his master, and superadded a tinge of pantheism. Disregarding the practice of his great predecessors, Æschylus and Sophocles, he not only evinced no sympathy with the religious system of his country, but sometimes ran so directly counter to it as to lay himself open to the charge of impiety. It is therefore in vain that we search the works of Euripides for those lofty aspirations and that noble faith which distinguish the tragedians of the early school, especially Æschylus, who, though as strongly convinced as Euripides of the historic worthlessness of the myths which made up the body of the popular religion, yet accepted them, and in so doing strove to develop their latent import, and thus indirectly elevate and refine the moral nature of the people. C. O. Müller, however, says truly concerning Euripides, "with respect to the mythical traditions which the tragic muse had selected as her subjects, he stands on an entirely different footing from Æschylus and from Sophocles. He could not bring his philosophical convictions, with regard to the nature of God and His relations to mankind, into harmony with the contents of these legends, nor could he pass over in silence their incongruities. Hence it is that he is driven to the strange necessity of carrying on a sort of polemical discussion with the very materials and subjects of which he had to treat." Towards the close of his life Euripides acknowledged the inadequacy of his ethical creed, even for the requirements of his own moral nature, by renouncing it, and tacitly acquiescing in the established religion. Such was the only course open to him, and he adopted it as an escape from scepticism, just as some of the keenest and subtlest intellects of our own day have been obliged to seek refuge from rationalism, sometimes from utter unbelief, within the pale of the Roman Catholic communion. In this way he found rest for himself, but it was too late for him then to repair the injury he had done by unsettling the foundations of belief in the minds of his younger contemporaries. In a merely artistic point of view, moreover, the tragedies of Euripides afford a striking proof of the decay of the Athenian drama. The old mythology from which he drew his names and incidents is often altered and misapplied in the most arbitrary manner, and almost always so as to throw discredit or ridicule on ideas or persons invested by popular consent with all the respect and reverence willingly paid to old tradition. Thus in the *Helena*, one of the most entertaining of all his tragedies, he adopts the theory of Stesichorus, that the wife of Menelaus remained concealed in Egypt while Paris only carried off an airy phantom which bore a resemblance to her, and about which the Greeks and Trojans fought with each other for ten years. Menelaus himself is introduced upon the stage in rags (a favourite method with Euripides of treating his heroes, for which he was lashed by Aristophanes), and declaring himself perfectly satisfied. In the *Alceste*, one of the most powerfully pathetic of ancient or modern plays, and to which Milton touchingly alludes in his famous sonnet—

> Methought I saw my late espoused saint
> Brought to me like Alceste from the grave,
> Whom Jove's great son to her glad husband gave,
> Reserved by force from death, though pale and faint—

"Jove's great son" is delineated more in the character of a glutton or a modern prize-fighter than as the son of Alcmena, whose life was spent in the service of the inhabitants of earth. Others of the plays exhibit still more glaring incongruities. In fact, as has been observed by Schlegel in his lecture on Euripides, "Though he frequently affects the singular and uncommon, he is at other times too familiar, and the tone of the discourse assumes a confidential appearance, and descends from the elevation of the cothurnus to the level ground. In this respect, as well as in the picture of several characteristic peculiarities bordering upon the ludicrous, Euripides was a precursor of the new comedy, to which he had an evident inclination, as he frequently paints the men and manners of his own times under the names of the heroic ages. Hence Menander expressed a most marked admiration for him, and proclaimed himself his scholar; and we have a fragment of Philemon, which displays such an extravagant admiration that it hardly appears to have been seriously meant. 'If the dead,' says he, 'were still to have feeling, as some people suppose, I should hang myself for the sake of seeing Euripides.'" In a much-quoted passage, Aristotle declares that Euripides delineated men and manners as they are, and not as they ought to be. Though in this way the poet opened up to himself a much wider range, both of character and incident, than if he had limited himself to the old mythology, it is very questionable if he did not also lower the dignity of his art, the more especially as he chose for its vehicle the familiar parlance of everyday life. In thus bringing down his heroes to the level of his audience, he lost sight of the lofty aims to which tragedy had been directed by his predecessors. "How few of his pieces," says Schlegel, "turn on the constant struggle with the decrees of fate, or even on a heroic subjection to them. His characters generally suffer because they must, not because they will." Plato's dictum against tragic poets generally applies with peculiar force to Euripides. He said that they gave men too much up to the dominion of the passions, and rendered them effeminate by putting extravagant lamentations in the mouths of their heroes. It is not too much to say of Euripides, in particular, that the tendency of his plays is to seduce and corrupt the feelings by working on the more tender and susceptible emotions of the human breast. The excessive lengths to which he sometimes goes tend to produce a directly moral licentiousness. At other times he works out his catastrophes with such earnestness, and power, and pathos, that Aristotle pronounced him the most tragic of poets. He qualifies this judgment, however, by declaring in the next sentence that "he does not arrange other things well." Still the general impression of his pieces is sometimes extremely immoral. It may be that to this cause he owed part of his popularity; but he sometimes outstripped the modesty of nature, so far as to shock even his Athenian audience. This pandering to a depraved taste on more than one occasion involved him in serious trouble. An anecdote is told, that he introduced Bellerophon with a eulogium on wealth, in which he preferred it to all domestic happiness, and ended with observing, that if Aphrodite the Golden shone like gold, she was deserving the love of mortals; and that the spectators, taking umbrage at this, wished to stone both poet and actor. Euripides then sprang forward and called out, "Wait only

till the end; he will be requited accordingly." In others of his pieces the demoralizing tendency is not to be so easily counteracted. Lies and other bad practices are not only freely used, but even openly defended; especially when the author believes himself to have an excuse in the motives which actuate the teller of the falsehood. The ancients themselves condemned him for the alluring colours in which he depicted sensual vice, and the ingenious sophistry with which he sought to defend these delineations. Indeed, this latter characteristic may be said to distinguish all his writings, and give a sort of colour to the charge (only partly true however) under which he labours of being the poet of the sophists.

It is impossible here to analyse minutely the tragedies of Euripides. The general tendencies of the poet's works have been already pointed out in some detail. One power alone which Euripides possessed in a higher degree than almost any other poet of ancient or modern times requires to be specially mentioned; his power, to wit, of delineating female character. The beautiful self-devotion of Alceste is depicted with the most overpowering pathos; and the same may be said of the Iphigenia at Aulis, though the character of that heroine is not sustained to the end of the piece *qualis ab incepto processerit.* Nor is the poet less successful in his terrible exhibitions of female passion. The unnatural love of Phædra in the "Hippolytus," and the conflict of jarring passions in the mind of Medea, were first laid hold of by Euripides as affording materials for dramatic creations, and have been worked out by him with a subtlety (sometimes over-refined) and skill that no subsequent dramatist, Shakspeare excepted, has ever surpassed. In the last chorus of the "Troades," when the captive women, allotted to their respective masters, are leaving Troy in flames behind them, and proceed to the ships, the poet rises into the region of the sublime.

According to Varro, Euripides wrote seventy-five tragedies, of which only five were rewarded with the first prize; according to Thomas Magister, he wrote ninety-two, of which fifteen were thus successful. Of these tragedies eighteen (or, if the authenticity of the Rhesus be admitted, nineteen) have descended to our times. We subjoin a list of these, with the year in which they were first produced upon the stage:—*Alcestis*, B.C. 438; *Medea*, B.C. 431; *Hippolytus Coronifer*, 428; *Hecuba*, 423; *Heracleidæ*, (probably) 421; *Supplices, Ion, Hercules Furens, Andromache*, of doubtful date, but probably assignable to this period of the poet's life; *Troades*, 415; *Electra*, 413; *Helena*, 412; *Iphigenia at Tauris*, doubtful; *Orestes*, 408; *Phœnissæ*, the last produced at Athens by the poet; *Bacchæ*, brought out at the Macedonian Court; *Iphigenia at Aulis*, produced at Athens after the poet's death; *Cyclops*, of uncertain date. This play is interesting as the only extant specimen of the Greek satyric drama.

The editio princeps of Euripides, containing, however, only four of the plays, was published at Florence towards the close of the fifteenth century, under the editorial superintendence of J. Lascaris. In 1503 appeared the Aldine edition, in which the Rhesus was incorporated, and the Electra omitted. Of subsequent editions may be mentioned that of P. Stephens, Geneva, 1602; Barnes, Cambridge, 1694; Musgrave, Oxford, 1778; Beck, Leipzig, 1778–88; Matthiäe, Leipzig, 1813–29; and the variorum edition, Glasgow, 1821. Many of the separate plays have been edited by the greatest of modern scholars, as Porson, Elmsley, Walckenaer, Monk, Pflugk, and Hermann. There have been many translations, prose and poetical, of individual plays into several languages of modern Europe. The whole works have been translated into English verse by Potter, Oxford, 1814; and into German by Böthe, Berlin, 1800. There is also a complete English prose translation in Bohn's Classical Library. (Müller's *History of Greek Literature;* Schlegel's *Lectures on Dramatic Literature;* the essay on Euripides by the Rev. Edward Elder, M.A., in Smith's *Dictionary*, &c. &c.) (J. C—L.)

EURIPUS, now the strait of Egripo or Negropont, the narrowest part of the Eubœan Sea, which at the town of Chalcis contracts to so small a breadth that a bridge has been thrown across, connecting the island of Eubœa with the mainland. See Eubœa.

Euripus, in the ancient amphitheatre, was a trench that separated the seats of the spectators from the arena. It was designed as a defence against the elephants and other beasts exhibited.

EUROCLYDON (from Εὖρος, *the south-east wind*, and κλύδων, *a wave*), the name of a tempestuous wind which drove on shore at Melita (Malta) the ship in which St Paul was sailing to Italy (Acts xxvii.) It is supposed to be the wind commonly known among modern mariners by the name of a *Levanter*, which is not confined to any single point, but blows in all directions, from the N.E. round by the north to the S.E.

EUROPA, in Grecian mythology, the daughter of Agenor king of Phœnicia, from whom the continent of Europe is said to have derived its name. Her beauty was such that Jupiter himself became passionately attached to her, and, assuming the form of a bull, carried her away on his back over the sea to Crete. Her children, Minos, Sarpedon, and Rhadamanthus, were adopted by Asterlus, king of that island, to whom Europa was ultimately married.

EUROPE,

Comparative advantages and disadvantages of this division of the globe.

One of the great divisions of the globe. On a first view Europe appears to be less favoured by nature than the other quarters of the globe over which it has obtained so great an ascendancy. It is much smaller in extent; its rocky and mountainous surface does not admit of those noble rivers, like inland seas, which lay open the remotest regions of Asia and of America to the commerce of the world. Its vegetable productions are neither so various nor so exuberant; and it is poorly supplied with the precious metals, and with many of those commodities on which mankind set the greatest value. On the other hand, the climate of Europe, if it nourishes a less luxuriant vegetation, is of an equal and temperate kind, well adapted to preserve the human frame in that state of health and vigour which fits it for labour, and promotes the development of the intellectual and moral powers. The mountains that intersect its surface are barriers which enabled infant communities to protect themselves from violence, and to lay the foundation of arts, knowledge, and civilization. If it has few large navigable rivers, its inland seas and bays are, from their position and extent, the finest in the world, and have been the means of creating and nourishing that commercial spirit which has been one great source of its improvement. Though comparatively deficient in gold and silver, it is abundantly supplied with those useful metals and minerals which minister still more essentially to the wants of civilized life. Its apparent defects have become the source of real benefits, and the foundation of its grandeur. The disadvantages of its soil and climate have excited the industry of its inhabitants, given them clearer ideas of property, kindled a resolute spirit to defend their rights, and called into existence that skill and enterprise, and those innumerable arts

and inventions, which have enabled the inhabitants of this apparently barren and rocky promontory to command the riches and luxuries of all the most favoured regions of the globe. It is only in Europe that knowledge and the arts seem to be indigenous. Though they have appeared at times among some of the nations of Asia, they have either stopped short after advancing a few steps, or they have speedily retrograded and perished, like something foreign to the genius of the people. In Europe, on the contrary, they have sprung up at distant periods, and in a variety of situations; they have risen spontaneously and rapidly, and declined slowly; and when they disappeared, it was evident they were but crushed for the time by external violence, to rise again when the pressure had subsided. It is only in Europe, and among colonies of Europeans, that the powers of the human mind, breaking through the slavish attachment to ancient usages and institutions, have developed that principle of progressive improvement, of which it is impossible to calculate the final results. The rudest tribe in Europe, in which this principle has taken root, has a certain source of superiority over the most improved nations of Asia and Africa, where society remains perfectly stationary. If these nations are ever destined to advance in civilization, they must borrow from Europe those arts which she has invented, and which belong to civilized life in every climate. But the tenacious adherence of rude nations to the customs and superstitions of their ancestors, will not allow us to hope that the benefits of civilization will be rapidly diffused in this way. It is more probable that colonies from the older states of Europe will multiply as the population becomes more and more redundant; and that these colonies will carry the arts and knowledge, the language and manners, of Europe with them, to the other quarters of the world. From prejudices on both sides, it is found that two races, in very different stages of civilization, do not readily amalgamate; and it is therefore probable that the feebler inhabitants of these countries, like the American Indians, will be gradually displaced by the continual encroachments of the more energetic races of Europe.

Boundaries and extent.

Europe is bounded on the N. and W. by the Arctic and Atlantic Oceans; on the S. by the Mediterranean, the Black Sea, and Mount Caucasus; on the E. by the Caspian Sea, the river Ural, and the Uralian Mountains. The greatest length of the continent is from Cape St Vincent to the Sea of Kara, in the direction of N.E. and S.W., and is 3490 English miles. Its greatest extent from N. to S. is from Cape Matapan to Cape North, 2420 miles. The superficies of Europe, including the Açores, Iceland, Nova Zembla, and all its other islands, is 3,700,000 English, or 2,800,000 geographical square miles; and the length of its coast line is about 16,000 miles.

Climate.

The climate of Europe is distinguished by two peculiarities. It enjoys a higher mean temperature than any of the other great divisions of the world in the corresponding latitudes; and it is not subject to such violent extremes of heat and cold. These advantages it owes chiefly to its numerous seas, inland bays, and lakes, which render its temperature similar to that of islands; and partly also, according to Humboldt, to its situation at the western extremity of the greatest range of dry land on the surface of the globe; the western sides of all continents being warmer than the eastern. Europe lies almost entirely within the temperate zone, not more than one-fourteenth part of its surface being within the arctic circle. Only a very small part of it is uninhabitable from cold, and it nowhere suffers much from excessive heat. The mean temperature at its southern extremity, in the latitude of 36°, is about 66° of Fahrenheit; and at Cape North, in the latitude of 71°, where the mean temperature is 32°, the cold is not greater than in the latitudes of 55° or 56° on the east coasts of Asia and America. Hence Europe is habitable at a higher latitude by 12° or 14° than either of these continents.

There is a difference of the same kind between the temperature of the sea-coasts of Europe and the interior. In islands, and on the sea-coast, the mean temperature of the year is higher, and the heat is more equally distributed through the different seasons. As we advance from the coast eastward the mean annual temperature diminishes, but the heat of summer and the cold of winter increase. Thus London has the same mean annual temperature as Vienna, but it has the summer of St Petersburg, and the winter is warmer than at Milan. The Mediterranean, the Baltic, and inland lakes, produce the same effect as the ocean, in an inferior degree. The following table shows, I. The temperature of the year, and the various seasons, in places having the same latitude; II. The different distribution of heat through the various seasons in places having the same mean annual temperature.

Mountains.

The mountains of Europe are more numerous in proportion to its extent than those of the other great continents, but they are of less elevation than the mountains of America and Asia. The highest and the most extensive chains in Europe run generally in the direction of east and west, and are placed near its southern shores. The central mass of the Alps, with which all the other mountains in the south of Europe are connected, forms the summit of the continent, and determines the position of the surface and the courses of most of the rivers.

Alps.

The principal mass of the Alps extends in a semicircle from Nice, on the shores of the Mediterranean, to Trieste, on the Adriatic, a distance of 550 miles. Southward of Mont Blanc the Alps consist of a single chain, with many lateral branches, which lie chiefly on the west side; but immediately to the eastward of Mont Blanc the principal chain divides into two, which inclose the sources of the Rhone. These meet again at St Gothard, and on the east side of it part into three chains, one of which loses itself in Bavaria, another in Austria near Vienna, and the third terminates near Trieste. A lateral chain of no great elevation passes eastward, and connects the Alps with the mountains of European Turkey. Smaller branches connect the Alps with the Bohemian and Carpathian Mountains on the north, with the Vosges and Cevennes on the west, and, through the latter, with the Pyrenees. The Apennines are but a prolongation of the Alps on the south. Mont Blanc, the loftiest of the Alps, and the highest mountain in Europe, has an elevation of 15,680 English feet; and Mont Rosa, the Jungfrau, the Schreckhorn, and several other summits, approach to this height. The elevation of the chain diminishes towards both extremities. In general, the escarpments, or steepest sides, are turned towards Italy, and the lateral and subordinate branches are most numerous, and extend farthest, on the opposite side. The central chain of the Alps consists chiefly of granite, gneiss, sienite, and other crystalline rocks. Among the lateral ridges, to the westward of St Gothard, calcareous rocks belonging to the

chalk and greensand abound, and a large area is covered by the Molasse and other tertiaries. On both sides are found great deposits of gravel, and large detached blocks or boulders, often at a vast distance from their original situations. Eastward from St Gothard the central chain is accompanied on each side by a calcareous chain of great elevation. Though the summits of the Alps are steep and rocky, and the higher valleys are filled with glaciers, there is much good soil below. The vine grows at the height of 1600 feet above the sea, the oak at the height of 3390, corn at 4200 feet, and the larch at 6720 feet. At 6400 feet above the sea we have the climate of Lapland in latitude 68°, so that a degree of latitude in the northern half of the temperate zone in Europe corresponds to an elevation of about 290 feet. The lower limit of perpetual snow, according to Humboldt, is at the height of 8760 feet, in the latitude of 46°.

Pyrenees. The chain of the Pyrenees, which is next to the Alps in elevation, runs in the direction of east and west. Its length is about 240 miles; but, if we include the Cantabrian Mountains, which continue in the same line without interruption, the whole length will be about 500 miles. The central chain of the Pyrenees proper is of granite, but the most elevated summits are of secondary limestone, and lie on the south side of the granite. Mont Perdu, esteemed the loftiest of the whole range, consists of fetid limestone, and rises to the height of 11,270 feet. The south side of the Pyrenees is rugged and precipitous; but on the north there is a gradual descent to the plains of France by a series of parallel ridges diminishing in height. The Cantabrian Mountains are lower than the Pyrenees, and present their steepest sides to the north. There are four other chains of mountains in Spain, all running in a direction approaching to east and west, and all connected with one another and with the Pyrenees. The highest of these is the Sierra Nevada, the southmost, one of whose summits rises to the height of 11,660 feet. The lower limit of perpetual snow on the Pyrenees is at the height of 8960 feet. The red pine grows at the height of 7480 feet, which is about 700 feet higher than any species of trees on the Alps.

Apennines. The Apennines form an uninterrupted chain 750 miles in length, extending from the south-west termination of the Alps near Nice to the Straits of Messina. The southern extremity in Calabria consists chiefly of granite, gneiss, and crystalline rocks. From the Gulf of Tarentum, northward to the Alps, the prevailing rocks in the central ridges belong to the chalk, greensand, and probably the oolitic formations, which are flanked by tertiary deposits, and in some parts by volcanic tufas. The most considerable elevations are about the middle of the chain, where Il Gransasso rises to the height of 9570 feet.

Carpathians. The Carpathian and Sudetic Mountains, with the Erzgebirge and Boehmerwald, may be considered as forming one continued chain, the length of which, from the point where it strikes the Danube in Hungary, to the point where it strikes the same river in Bavaria, is about 1200 miles, exclusive of the transverse branches which separate Moravia from Bohemia and Hungary. The declivities of this long range of mountains are steepest on the south side. The elevations are lowest on the west, and generally increase as we advance eastward, till we come to the sources of the Theiss in the north of Hungary, after which they again decline. The Fichtelberg, at the westmost point of the chain, is 4030 feet high: Schneekoppe, the highest of the Sudetic Mountains, is 5280 feet, and Lomnitz in Hungary, the loftiest of the whole range, is 8460 feet. None of these mountains rise to the region of perpetual snow, the lower limit of which, according to Wahlenberg, is about 60 feet above the summit of Lomnitz. The rocks of these chains consist of granite, gneiss, and silurians, associated with greensand and oolites. Corn and fruit trees are said to grow at a greater height upon the Carpathians than upon the Alps, though the latter are two degrees farther south.

Dofrines. The chain of the Dovrefeld, Dofrines, or great Scandinavian Alps, is about 1000 miles in length, and has a general elevation of from 3000 to 6000 feet. The altitude of Skagstlos Find, the highest mountain of the chain, is 8400 feet. These mountains consist almost entirely of the older rocks, and present their steepest sides to the west. On Sulitelma, the highest mountain of this chain in Lapland, in latitude 67. 10., the lowest limit of perpetual snow is at the height of 3500 feet.

Urals. The Urals, or Uralian Mountains, which form the north-eastern boundary of Europe, extend from N. to S. through 20° latitude, with a breadth of about 40 miles. They rise very imperceptibly from the plains on both sides, and, where they are crossed by the road from Moscow to Siberia, the ascent and descent are so nearly imperceptible that, were it not for the precipitous banks alongside of them, the traveller would hardly suppose he was crossing a range of hills. The general elevation of that part of the range seems not to exceed 1350 feet, and the base on which it rests is itself 900 feet above the level of the sea. To the north of 58° 20′ there are several summits that rise to 2500 feet; but the higher part of the range is situate to the N. of 59°, and the highest of all, the Daneshkenkamen lies to the N. of 60°. The chain consists of palæozoic formations resting upon, and penetrated by igneous rocks. They contain much gold, which is procured by washing the thick masses of gravel resting on their flanks. Towards the S., the Urals diverge into or are connected with a number of small ranges that extend to the shores of the Caspian Sea and the Aral, and into the steppes of the Kirghiz, and even seem to be connected with the Ust-Urt, or High Plain, that rises to an elevation of 770 feet between the two seas. The Urals are rich in minerals, especially in gold and platina, but these are found in most abundance on the eastern or Asiatic side of the range. The mountains of Nova Zembla may be considered as a prolongation of the Urals. Their principal summit is Glassowsky, which has an elevation of about 2500 feet above the level of the sea.

Caucasus. The great range of Caucasus, which is now assumed to be the south-eastern boundary of Europe, extends in a north-westerly and south-easterly direction along the north-east coast of the Black Sea, and across the isthmus, terminating with a series of low hills in the peninsular promontory of Abcheron on the W. side of the Caspian Sea, along which its diverging branches form a large *Daghestan*, or hill country. The length of the principal chain is about 700 miles, with a breadth varying from about 60 to 140. The loftiest summits are found near the middle part of the chain, and are covered with perpetual snow. Elburz, the highest peak, has an elevation of 17,796 feet; Kasbec, the next highest, of 15,345; and the crest of the pass of Dariel, through which the only practicable road is carried, between Vladi-Kaukas and Teflis, rises to 8000 feet. The snow-line along the chain is between 10,000 and 11,000 feet above the level of the sea. The mountains of the Crimea, though separated from the Caucasus by the strait of Yenikaleh, and the alluvial delta of the river Kuban, would seem to be a prolongation of the chain, separated by some volcanic convulsion. This, however, may be considered doubtful, as there are no ignigenous rocks at all in the Crimea, so far at least as yet known, while granite is to be found in the Caucasus. The geological structure, however, of the Caucasus is very various. A considerable portion of the higher regions consists of white limestone, with ridges of black slate. The loftiest peaks are composed of granite, hornblende, schistes, porphyry, and trachytes. Many parts of the range are exceedingly craggy and precipitous; but, in other places, are found level plains and very beautiful and fertile valleys.

Europe.

Mountains of Turkey.

A long mountain range extends in an irregular curve from the Adriatic to the Black Sea, in the latter of which it terminates with *Emineh Burun*, or Cape Hæmus. The western portion, however, of the range properly belongs to the Dinaric Alps; and the Turkish *Balkans* (ancient *Hæmus*) begins near the sources of the river Lepentz, 21° E. Long., a point from which two great ranges diverge, one to the south, forming the ancient Pindus, while the Hæmus or Balkan range extends eastward, with a general elevation of less than 5000 feet, though a few of its summits reach the limit of perpetual snow; and the Tchar-dagh, the culminating point, rises to about 9700 feet. The range is broken through by numerous ravines, deep and narrow, and of the most terrific appearance; but there are also several practicable passes. The south side of the range consists of argillaceous schist, and is much more precipitous than the north side, which is calcareous. The range is well wooded, and believed to be rich in minerals. Near the east end a minor range, called the Little Balkan, diverges in a south-easterly direction, and, running parallel to the shores of the Black Sea, terminates near the Bosphorus. From the Tchar-dagh the Pindus extends southwards, dividing Albania from Rumelia, and forming a long range of wild hill-country with many lofty summits. To the south, it is connected with the mountains of Greece, which divide that country into a number of valleys and promontories. But the loftiest range is the Despoto-dagh, which is connected with the Balkans near 42° N. Lat. and 24° E. Long., and extends eastward between the basin of the river Maritza and the shore of the Archipelago. Its summits reach an elevation of 8000 feet, and it is chiefly composed of crystalline slates, gneiss, granite, and granular limestone.

Mountains of France.

Besides the Alps, which form its south-eastern border, and the Pyrenees, which divide France from Spain, there are in France several mountain ranges of considerable elevation. The Cevennes, the Forez, and the mountains of Auvergne, form together a group that divides the low country on the Mediterranean and the basin of the Rhone from the plains that extend westward to the Atlantic Ocean and the Bay of Biscay. The elevation of most of the summits is only between 3000 and 5000 feet; but in Auvergne, the Plomb-de-Cantal rises to 6093 feet, and the Puy-de-Sancy to 6221. Between France and Switzerland the range of Jura has nearly the same elevation; and further north the range of the Vosges divides the basin of the Rhine from that of the Moselle, but it is comparatively low, its summits ranging from about 1400 feet to 4000, and the loftiest rising only to 4693 feet above the level of the sea. From the plateau of Langres, in the department of the Haute Marne, a ridge of high ground, scarcely rising into hills, proceeds westward, between the Seine and the Loire, terminating in Finistere, while other ridges extend northwards into Belgium, separating the valleys of the Moselle, the Meuse, and the Marne.

Mountains of Britain.

The mountains of Britain are comparatively insignificant. They extend in a long range, or series of ranges, with many divergencies and interruptions, along the west side of the island, about 630 miles in length; but it is only in Wales and the north-western parts of England and Scotland that they attain an elevation comparable to that of even the lowest of the continental ranges we have mentioned. Snowdon, in Caernarvonshire, the highest mountain in Wales, rises only to 3570 feet; Helvellyn and Scafell, in Cumberland, to 3055 and 3166; Ben Nevis and Ben Muck-Dhui, in Scotland, to 4370 and 4390. They consist principally of primary and transition rocks.

Great Plain.

The Pyrenees, the Cevennes, Forez, Vosges, Jura, Alps, Apennines, Bohemian and Hercynian Mountains in Germany, Carpathians, and the Balkans, form together, as we have seen, a long range of high ground, inclosing many elevated valleys, and leaving between them and the shores of the Mediterranean Sea only a series of long narrow stripes of lowland. To the northward, however, Europe sinks into an immense plain, which extends all the way from the German Ocean and the North Sea to the Ural and Caucasian Mountains, and the shores of the Caspian and Black Seas. This plain would seem to have formed, since the commencement of the tertiary period of geology, though perhaps not all at the same time, the bed of the sea; for it is everywhere covered with tertiary formations and marine drift, and contains the fossil remains of animals that could only have lived in salt water. It includes the whole basins of the Baltic and White Seas; and the Scandinavian mountains would seem to have formed a large island bordering it on the N.W. The south-western portion of the plain is traversed by the large rivers that flow northwards from the Alps, and the Bohemian and Sudetic Mountains, which form the watershed between it and the basins of the Danube, the Rhone, and the Po; but eastward the watershed between the Baltic and the Caspian and Black Seas, only a few hundred feet in elevation, may be traced from a spur of the Carpathians, near the source of the Dneister, through the Russian provinces of Volhynia, Grodno, Minsk, Smolensk, Bialistock, Pskov, Twer. Novgorod (where it forms a sort of plateau, and rises into the Valdai Hills, the highest of which is only 1370 feet above the level of the Baltic Sea), and Vologda, to the Ural Mountains at the sources of the Petchora. The northern slope, forming the basin of the White Sea, possesses a barren soil and a cold climate, and towards the north stretches out into immense plains, covered with moss, marshy in summer, frozen in winter, only interrupted with a few rocky ridges. The southern slope improves in quality as it advances southward, and the middle region is a country of great fertility; but farther south this fertile region is separated from the Black Sea and the Caspian by the *steppes*, the surface of the higher portion of which is in general only about 200 feet above the level of the sea, though towards the Caspian it sinks much lower. Throughout the whole space occupied by the higher steppes, which extend westward from the Don and the Manytsh, along the Sea of Azof and the Black Sea, including three-fourths of the Crimea, and crossing the Dnieper westward along its right bank, till they meet the outskirts of the fertile regions of Little Russia, there is nothing to be seen but a coarse, rank grass, except in the hollows along the river banks, which produce a finer vegetation. The soil of the lower steppes, which extend along the Caspian Sea from the river Ural to the foot of Caucasus, with a breadth of from 250 to 300 miles, is covered with a fine sand mixed with shells, producing no trees or shrubs, but only at certain seasons a scanty grass. It is everywhere strongly impregnated with salt, as if the region had recently been, what there is every reason to believe it was, the bed of a sea.

Volcanoes.

Europe contains several volcanic regions, in some of which the volcanic agency is still active, while in others it has been long quiescent at least, if not extinct. A volcanic belt is believed to extend through Central Asia, and Asia Minor, the Archipelago, Greece, Naples, Sicily, the southern parts of Spain and Portugal to the Açores. In the Archipelago, the island of Santorin has been the grand centre of volcanic action for the last 2000 years; and the neighbouring island of Milo is also a volcano of recent aspect, though the epochs of its eruptions are not known. On the eastern shore of Sicily rises the stupendous cone of Etna or Mongibello, to the height of 10,873 feet, composed entirely of volcanic products, and known to have been in activity for nearly 2500 years. To the northward of Etna, the islands of Stromboli, Vulcano, and Vulcanello, in the Lipari group, are still active, throwing out continually both fire and smoke. To the south-west of Sicily the island of Pantellaria is entirely volcanic, and covered with prodigious quantities of lava, pumice, and scoriæ. Livy mentions (Book 39) that an

Europe.

island was said to have risen out of the sea near Sicily in the year 183 B.C., and in A.D. 1831 a volcanic island actually rose from the sea, between Sciacca and Pantellaria, but soon disappeared, being washed away by the waves. On the shore of the Gulf of Naples stands Mount Vesuvius, a volcano in constant activity; while to the westward of that city there is a volcanic region, including the island of Ischia, where the fire has been quiescent since the sixteenth century. Further north, round Rome, there are several extinct volcanic craters, most of which are now filled with water, forming so many beautiful though unwholesome lakes. Near the coast of Valencia, in Spain, the islands of Columbretes are the remnants of an extinct crater, and the traces of another volcanic region are to be found near Olot in Catalonia. The Açores (if they should be reckoned to Europe) are all apparently of volcanic origin, but contain no active volcanoes. Along the whole line of this volcanic belt, earthquakes are frequent and destructive. On each side of the line of greatest commotion there are parallel belts of country where the shocks are less violent. At a still greater distance, as far as the foot of the Alps, there are spaces where the shocks are rarer and much feebler; though while we are writing (January 1855) we have learned that two severe shocks of an earthquake were felt at both Nice and Turin, early in the morning of 29th December 1854. Beyond these limits again all the countries of western Europe are liable to slight tremors, at distant intervals of time; but these may be considered as mere vibrations. Shocks of this kind have been felt in England, Scotland, northern France, and Germany, particularly during the tremendous earthquake that destroyed Lisbon in 1755.

Besides the volcanoes that are still active, or have been so within historic times, there are traces of extinct volcanic action in different parts of Europe. The plain of Limagne, in Auvergne, in Central France, forms the base of a long chain of volcanic cones and domes, which, to the number of 70, form a zone of nearly 20 miles in length by 2 in breadth, and varying in height from 500 to 4000 feet. The whole of these cones present the same general character, that of well-defined craters, inclosed by regular cones, on whose sides the lava currents may be traced, as easily as on those of Vesuvius. Appearances of the same kind are found near Velay, in the Viverais. Near the Rhine the chains of the Vogelberg and Westerwald are formed of volcanic products; and the Eifel, a group of hills near the left bank of the Rhine, in the Prussian government of Aachen, or Aix-la-Chapelle, exhibits all the signs of extinct volcanic action, in its conical elevations, lava streams, and round deep craters now filled with water.

Far to the north-west of the mainland of Europe, the island of Iceland forms a volcanic region apart. The whole island appears to be of volcanic formation; there are several volcanoes still in full activity, and in the interior there are vast tracts covered with lava, scoriæ, and volcanic sand. From the beginning of the twelfth century there is clear evidence that, during the whole period, there has never been an interval of more than forty, and very rarely one of twenty years, without either an eruption or a great earthquake. Some eruptions of Mount Hecla have even lasted six years without intermission; but from 1783 that volcano remained quiescent till 1845, when it broke out anew. Earthquakes have often shaken the whole island at once, causing great changes in the interior; and new islands have often been thrown up near the coasts. In the intervals between eruptions, innumerable hot springs give vent to subterranean heat, and solfataras discharge copious streams of inflammable matter. In the south-western part of the island, nearly a hundred intermittent springs of steam and boiling water, the celebrated Geysers, are said to be found within a circle of two miles. The island of Jan Mayen, between Iceland and Spitzbergen, contains an active volcano; and the mountain of Sarytcheff, in the northern island of Nova Zembla, is the most northern volcano at present known.

Rivers.

Europe is well watered with rivers, but they are mere brooks compared with the mighty streams of Asia and America, and, from the unevenness of the surface, afford in general no great extent of inland navigation. The Danube, the largest river that is entirely in Europe, is about 1500 miles in length, and drains an area of 370,000 square miles. But the Amazons, though only twice the length of the Danube, drains a surface seven times as large, and equal to four-fifths of the continent of Europe; and, as the quantity of rain that falls in tropical countries is much greater than in northern latitudes, it is probable, notwithstanding the increased evaporation there, that the Amazons conveys more water than all the rivers of Europe put together. If we divide the length of the Danube into a hundred parts, the length of the principal rivers of Europe, expressed in these parts, will be as follows: Danube, 100; Volga, 130; Dnieper, 72; Don, 69; Rhine, 49; Elbe, 42; Vistula, 41; Loire, 37; Tagus, 32; Oder, 31; Rhone, 30; Seine, 23; Po, 21; Tiber, 10; Thames, 9.

The courses of the great rivers show the fall of the country through which they flow, but it would be absurd to take the average of the fall per mile from the measurements of their whole lengths, for, with the exception of the Volga, and other rivers of Russia, the early parts of their respective courses are among mountains, or in elevated valleys, where, and from which, the fall is very rapid; and it is only when taken from the points where they leave their mountain cradles and reach the plains, that such an average will truly indicate the extent and degree of the general slope of the continent. The source of the Volga is only about 560 feet above the level of the Caspian Sea, into which it flows, and the length of its course being at least 2000 miles, without any serious rapids, the average of its fall is consequently very regular, and little more than three inches a mile; but, the direct distance being only 900 miles, the slope of the country exceeds seven inches a mile. The source of the Danube, in Suabia, is about 2176 feet above the level of the Black Sea; but its fall is in several places very rapid, particularly between Passau and Vienna, and at the *Iron-gate*, through which it passes from the plains of Hungary to the low level of Wallachia. The average fall, therefore, of such a river would be a most fallacious index of the configuration of the whole length of country through which it flows. Its course is indeed through a series of terraces, separated by deep falls. The sources of the Rhine, in the heart of Switzerland, have an elevation of more than 7000 feet, but when it reaches the Lake of Constance it has already fallen to 1300. From that lake to Basel, where it leaves the mountains, it falls more than 500 feet, and even further down it still flows with great impetuosity, falling 400 feet more before it reaches Strasburg, a distance of only 70 miles. The average, however, of its fall from the latter city to the sea is only about one foot a mile. The elevation of the *Elbbrunnen*, or sources of the Elbe, in Bohemia, is 4260 feet, but the river falls so rapidly, within a short distance, that, after passing the northern mountain border of Bohemia, its elevation is found to be, at Dresden, only 280 feet. The average fall from that point to the sea is less than a foot a mile. The elevation of the source of the Oder is 1705 feet, but at Breslau it has already fallen to 370, and the average fall of the remainder of its course is likewise about a foot a mile. The elevation of the source of the Vistula we have not been able to learn, but as it is navigable from Podgorze, near Cracow, to the sea, its average fall is probably much the same as that of the Elbe or the Oder.

Few of the rivers of Europe are of much importance as means of communication and transit. The Volga becomes navigable at Rief, about 70 miles from its source, and so continues to the Caspian Sea, a distance of more than 2000

Europe.

miles, following the course of the river. It is the great highway of Central Russia, so many as 5000 loaded boats annually descending its stream; but as it ends unfortunately in an inland lake, it is of no use for the transport of other foreign wares than the produce of the sandy and barren regions that surround the Caspian. The Volga is so connected with the other great rivers and the lakes of Russia by canals, that there is uninterrupted navigation from the Baltic to the White Sea, the Black Sea, and the Caspian. The Don has a course of 900 miles, but has so many shallows as to be nowhere navigable for large or sharp-bottomed vessels. The Dnieper, the next largest river of Russia, has a course of 1000 miles, and is navigable from Smolensk to Ekaterinoslav; but, further down, its channel is so obstructed with rocks and falls for 150 miles, that navigable communication between the sea and the inland provinces through which it flows is completely cut off. The Danube becomes navigable at Ulm, 1500 miles from its mouth; but between Passau and Vienna it flows among mountains, and navigation is rendered difficult by the rapidity of the stream, and the frequent occurrence of rocks, shoals, eddies, and whirlpools; and, in leaving Hungary, through a narrow gorge of 60 miles in length, which it has cut for itself across the mountains that inclose that country, it falls in a series of rapids, the lowest of which is the famous Irongate, through which the stream rushes with great rapidity in a narrow channel, between stupendous rocks, ending in a series of whirlpools, eddies, and smaller falls. Here navigation was considered to be effectually stopped; but we have just learned (Jan. 1855) that steamboats have at last been constructed so as to be considered capable of passing these rapids in safety, and that they will be immediately put upon the river. It is also proposed to cut a channel through the rocks 1200 yards long, 40 feet wide, and 6 feet deep, which will give plenty of additional depth for the steamers and other loaded vessels. The number of workmen to be employed on this gigantic undertaking is 2000, and the work will extend over a period of six years, at a cost of two millions of florins. So numerous, besides, are the windings of the Danube through the comparatively level plains of Hungary, that between Presburg and the Black Sea, a direct distance of 650 miles, the course of the river actually measures 1200. The Rhine is navigable above the lake of Constance, but the navigation is stopped by the Rheinfall near Schaffhausen. From that point to Basel it is not very easy or always practicable; to Strasburg it is not free from danger, but further down the river becomes a fine navigable stream, not quite free indeed from difficulty and risk, particularly in the deep and narrow gorge which it passes through between Bingen and Coblentz; but below Coblentz the channel is uninterrupted and free from danger. Between the Rhine and the Danube there is a navigable communication by means of the rivers Meyn and Altmuhl, which are connected by the Ludwig's canal in Bavaria. The Elbe, and its tributary the Moldau, are both navigable even in Bohemia, and from their confluence to the sea there is no serious interruption. The Oder is navigable downwards from Silesia, and is of the utmost importance as the channel of conveyance for the productions of that country to the sea. Breslau, Frankfurt, and Stettin, three of the principal commercial towns of Prussia, stand on its banks, and it is connected by canals with the Vistula, the Havel, and the Spree. The Vistula is, like the Oder, the principal channel of transit between the Baltic Sea and the Polish provinces of Austria, Russia, and Prussia, and begins to be navigable at Podgorze, near Cracow.

These are the only rivers that seem to require notice as navigable streams in a general survey of Europe, though there are many others of great importance to the several countries in which they are found, as the Thames, the Tyne, the Clyde, the Rhone, the Po, &c.

Europe.

Islands.

The islands of Europe, including Nova Zembla and Iceland, occupy a space equal to 280,000 square miles, or one eleventh part of the surface of the continent; and of this space the area of the British isles amounts to rather less than one half. The Black Sea is the only large sea connected with Europe in which there are no islands worthy of notice.

Seas. Mediterranean.

The Mediterranean, the noblest inland sea in the world, forms the southern boundary of Europe, separating it from Africa, and partly also from Asia. It may be considered as the bottom of a vast basin formed by the Pyrenees, Alps, Balkans, Taurus, Libanus, and Atlas. These mountains are everywhere near its shores, which are consequently narrow and much inclined. Hence there are no such extensive plains as Hungary or Poland near the coast of this sea, and hence also no very large rivers fall into it except the Nile; and altogether it receives a smaller quantity of water from rivers than the Black Sea or the Baltic, though six times larger than either. Its length is about 2350 miles, its breadth is extremely various, and its surface (exclusive of the Black Sea) is nearly equal to 1,000,000 of square English miles, or something less than a third part of the continent of Europe. It is generally of great depth; and its numerous islands, which have uniformly a rocky surface, appear to be the summits of marine mountains.

Baltic

The Baltic, the greatest inland sea that is entirely in Europe, is about 1200 miles long, of very unequal breadth, and presents a surface of 175,000 square miles, exclusive of islands. It occupies the bottom of another large basin, 850 miles in breadth, and 1400 in length, extending from the Norwegian mountains on the north and west, to the Carpathians on the south, and to the high lands in which the Dnieper, the Don, and the Volga rise, on the east. This basin, equal to one-third of the surface of Europe, has a very different character from that of the Mediterranean. The mountains are not very elevated, and are so placed as to leave a large tract of land very little inclined between them and the Baltic, over which, especially on the south side, many considerable rivers flow with a gentle current. Hence the country round the Baltic is much more level than round the Mediterranean; lakes are numerous in the low grounds, from the want of declivity; the sea itself is comparatively shallow, and receiving a much greater quantity of river water, it is much less salt. The commerce of the Baltic is annually interrupted by the ice, which endures four months in the Gulfs of Bothnia and Finland. The whole of this inland sea has sometimes been frozen over for a short time, but this is of rare occurrence.

Black Sea.

The Black Sea, which belongs only partly to Europe, is 700 miles long and 380 miles broad, and, including the Sea of Azof, presents a surface of 170,000 square miles, being almost of the same magnitude as the Baltic. It derives four-fifths of its water from Europe, and is curiously distinguished from the other seas of this quarter of the globe, by its being almost totally destitute of islands.

White Sea.

The White Sea is 450 miles in length, of a very irregular figure, and occupies a space equal to 35,000 square miles. It receives some considerable rivers, but is frozen during six months of the year.

Lakes.

The lakes of Europe are numerous, and are of two kinds; those which lie in cavities at the foot of high mountains, and which are generally deep, such as the lakes in the Alps, on the east side of the Norwegian mountains, and among the mountains of England and Scotland; and those which are formed in level countries from the want of a sufficient declivity to carry off the water, such as the lakes in Finland, Poland, and Brandenburg. Four-fifths of the lakes of Europe are in the country round the Baltic.

Vegetable productions.

The soil of Europe has not the extremes of luxuriance or sterility which belong to the soil of the other great continents. If it does not yield the rich fruits of tropical cli-

Europe. mates, it is not deformed by burning sands like Africa, or by pestilent swamps like America. It does not pour forth its riches spontaneously, but, soliciting the care and the labour of man, it requites his industry with what is necessary to supply his wants; and, by exercising and sharpening his powers of mind, has given birth to those arts which place the productions of the most favoured climates at his disposal. Many of the plants which have been domesticated in Europe are natives of distant countries. The vine, the olive, and the mulberry, are said to have been brought from Syria by the Greeks; the Arabians introduced cotton; maize was received from the Indian tribes of America; the walnut and the peach come from Persia; the apricot from Armenia; and the sugar-cane and orange from China. There are not very many plants belonging to the tropical regions that absolutely refuse to grow in Europe, but an enlightened economy finds other productions more profitable. Besides sugar and cotton, the banana, the orange, citron, fig, pomegranate, and date, grow in the south of Europe. But the more delicate fruits are confined to southern latitudes, and disappear one by one as we advance northward. And it is worthy of remark, that the zones in which they grow generally follow the lines of equal summer heat, and run obliquely across the continent in the direction of south-west and north-east. If a line be drawn on the map from Brest to Konigsberg, skirting the southern shores of the English Channel and the Baltic, the zones that limit the growth of different plants will run nearly parallel with this line. This holds generally in the south and middle of Europe; but in the extreme northern parts, and especially with regard to plants that require a moderate heat continued for a considerable time, the lines that limit the growth of certain vegetables seem to follow a different course, and decline towards the south as we advance eastward, in consequence of the increasing severity and length of the winter. It is scarcely necessary to say, that the zones, traced as proper for different plants, only mark the limits within which their cultivation is found advantageous. Most of them will grow beyond these limits; but they either require some peculiar advantages of soil and situation, or they are less profitable than other kinds of produce.

The sugar cane, one of the most desirable tropical plants, grows in Sicily and the south of Spain, in the latitude of 37° and 38°. The culture of it, which was once extensive in the latter country, has not yet been entirely abandoned, even since sugar was procured from the West Indies. Cotton is cultivated in the south of Spain on a small scale, to a greater extent in Sicily, the south-east angle of Italy, and in Greece and its isles, as high as the latitude of 41½°; we find it again at Astrakhan, in the latitude of 46°. The orange and the lemon come to perfection in the west of Europe, only in the countries to the south of the Pyrenees and Apennines, within the latitude 43° in Spain, and 44° in Italy. The olive does not succeed on the west coast of France in the latitude of 43°, but grows as far north as 44° or 45° on the east of France, and in Italy. Attempts to raise it at Astracan, in latitude 46°, have not succeeded, on account of the rigour of the winter. The fig and the pomegranate, which accompany the olive in the west of Europe, are found in the Crimea in the east, at the latitude of 46°, where the olive will not grow, a proof that these trees bear the winter cold better. The climate proper for maize is found to terminate on the west coast of France at 45½°; on the Rhine at 49°; on the Elbe at 50° or 51°. Rice has nearly the same geographical range, but requires a peculiar soil and situation. The culture of the vine extends as far north as the latitude of 47½° on the Atlantic coast; on the Rhine to 50½°; and on the Oder to 52°. In Russia it grows as far north nearly as 52°, but is not cultivated beyond 50°. The mulberry generally accompanies the vine. The limits of the culture of the common cerealia are not so well defined, as the necessities of man oblige him to raise corn under the most unfavourable circumstances. In a general point of view, however, the parallel of 57° or 58° may be regarded as the northern limit of the cultivation of wheat in Europe. It is raised as far north as 60° or 61° in Finland, but only in some favoured spots. In Russia, generally, it is chiefly confined to the provinces under the latitude of 57°. The hardier cerealia, rye, oats, and barley, are cultivated in some sheltered situations on the coast of Norway, as high as the latitude of 69° 55′. But on the east side of the Norwegian mountains these grains scarcely ripen in the latitude of 67° or 68°; and farther east, in Russia, it has been found impossible to carry cultivation of any kind beyond the latitude of 60° or 62°. Barley, which accommodates itself better than any other grain to these high latitudes, by shortening the period of its growth, is sown and reaped within the space of seven or eight weeks. But the introduction of potatoes promises to be of vast advantage in these cold regions, as this plant thrives and yields a produce of thirty or fifty fold in places where grain often will not ripen. Peaches and apricots succeed with much care as far north only as the latitude of 50° in Russia; melons as far as 52°. The plum and the cherry grow wild as far north as 55°, but are carried farther by cultivation. Fruit trees and the oak terminate in Sweden, at Geffle, in the latitude of 61°; but the pine and the birch advance within the arctic circle; and the former grows to the height of 60 feet in the latitude of 70°. The blackberry and the whortleberry grow in Lapland, and the gooseberry even in Greenland. Tobacco is extensively cultivated over the greater part of the continent of Europe, from Sicily to Sweden. Flax and hemp have as extensive a range as corn, but they are raised in the greatest perfection between the latitudes of 45° and 60°.

We have stated that the superficial extent of Europe is about 3,700,000 square miles. If we draw a curved line from a point in the Uralian Mountains, about the latitude of 60° or 61°, to the west coast of Norway, in the latitude of 69°, passing through the Lake Onega, and a little to the northward of the Gulf of Bothnia, this line will mark the extreme limits of cultivation, and will cut off a space equal to 550,000 square miles, or nearly one-seventh of Europe. The space cut off, however, is not entirely useless, as a part of it produces pasturage and wood. The cultivation of rye, oats, and barley, is confined to the region south of this line, and includes more than five-sixths of Europe; but in the northern parts of this zone only a very small proportion of the land will bear corn. The region adapted to the cultivation of wheat comprehends about four-sevenths of Europe, and includes all the densely peopled parts. The region of the vine extends over three-sevenths of Europe.

Metals and minerals. Europe, in proportion to its extent, is probably richer in mineral wealth than the other quarters of the globe. It contains all the metals except platina; and though it affords gold and silver only in limited quantities, iron, copper, lead, with coal and salt, commodities of greater value to society, are abundantly and widely distributed. The mountains, consisting of primary and transition rocks, are the great depositaries of these mineral treasures.

Iron is found in all the chains of mountains in Europe. The richest mines are in the Dofrefeld, or Scandinavian Alps. But rich mines are also found in the Alps of Styria, Carinthia, and Bavaria; in the Pyrenees, the Vosges, the Cevennes, the coal districts of Britain, the Urals, the Carpathians, the Hartz, and many other places.

Copper is also widely distributed, though less abundant than iron. The richest mines are in Hungary, in the Carpathian Mountains. It abounds also in the Saxon and Bohemian Mountains, in the Dofrefeld, the Urals, the north of England, and the Alps; and it is found in the Vosges, the

Pyrenees, and other mountains of Spain, in the north of Germany, and in Tuscany.

Lead exists in the Alps, Carpathians, Pyrenees, Cevennes, Vosges, the British mountains, and the Uralian chain.

Tin is found only in a few places in Europe. The richest mines are in Cornwall; next to these are the mines in the Erzgebirge. It is also found in Hungary and Spanish Galicia.

Mercury, like tin, is confined to a few places. The mines of Idria, in Austria, which yield 8000 to 10,000 quintals per annum, are the most productive in Europe. There are also considerable mines at Deux Ponts, in the Palatinate; in the Spanish province of La Mancha; and in Transylvania.

Gold is widely diffused through Europe, but generally in such quantities as not to repay the expense of working. It is wrought, however, in the Carpathians, the Urals, the Dofrefeld, and the Alps. Anciently there were rich mines of gold in Spain and Greece.

Silver is more abundant than gold, though less widely distributed. There are productive mines of this metal in the Erzgebirge, the Carpathians, the Urals, the Norwegian Dofrefeld, and in Sardinia. It is found also in the Alps, the Vosges, and the Sierra Morena.

Of coal, the richest mines are found in the north and west of England. It abounds also on both sides of the middle region of Scotland; in Ireland; in the Netherlands; in one-fourth part of the French territory; and occurs more sparingly in Saxony, Hanover, Denmark, Sweden, Russia, Hungary, Bohemia, Moravia, Silesia, Bavaria, Austria, Franconia, Westphalia, Swabia, Catalonia, and some other parts of Spain, in Portugal, and in Sardinia. After Britain, France and Belgium are the countries in Europe best supplied with this mineral.

Salt is procured from the waters of the ocean, and, in the interior of Europe, from numerous salt mines and salt springs. The most productive salt mines in Europe are those in Poland, on the north side of the Carpathians, and those in Salzburg, on the north side of the Alps, both of which belong to Austria. There are also extensive depositaries of mineral salt in Transylvania and Hungary; in Valentia, Navarre, and Catalonia, in Spain; in Cheshire in England; and in Bavaria and Switzerland. Salt springs are numerous along the sides of primitive mountains in most countries of Europe. The most extensive salt mines of Russia are in Asia; but very large quantities of salt are collected from the *tuzlas*, or salt-lakes in the Crimea.

Antimony, cobalt, zinc, manganese, sulphur, alum, and a great variety of other mineral productions, are found in Europe; but it is unnecessary to specify their localities.

It is observed that the Alps, Pyrenees, Carpathians, and other mountain chains which run east and west, are richest in metals on the south side; while the Dofrines, Urals, and others which run north and south, are richest on the east side. Of the mountain chains of Europe, the Apennines are the poorest in metals, the Carpathians probably the richest.

Animals.

The animal kingdom of Europe is less varied than the vegetable. In the north, the white bear and the blue fox, the peculiar natives of the arctic regions, appear at times on the coasts of Russia and Lapland, and vast numbers of foxes inhabit Nova Zembla. The rein-deer abounds in Lapland, but can scarcely live to the south of 65°. In Russia, owing to the greater coldness of the climate, it is found as low as 63°. It forms the chief wealth of the inhabitants of those dreary regions. The lemming, a curious migrating animal, lives between the 55° and 65°; and the glutton is observed in the same region. The elk, an animal every day becoming scarcer, frequents Lithuania, and even some parts of Prussia, but is seldom found farther north than 64°. Rats and mice are not to be seen in the most northerly parts of Lapland, though they abound everywhere else.

The strongest horses and beeves are found in the great plains which extend from Moldavia and the Ukraine to Denmark and Flanders; they are found so far north as 64°. In Lapland, however, the ox is even found at 71°, and in Iceland there are horses even beyond the polar circle. The *urus* or *aurochs* (wild ox) is still occasionally seen in Poland. In the same region, and through the whole of central Europe, there is a breed of sheep originally the same as those of Spain and England. The ass, though far from being reckoned a delicate animal, does not bear cold so well as the horse. In Europe it is rarely seen beyond 52°. The climates most favourable to the ass are those between 20° and 40°. There he grows large and handsome, and is lively and docile; but farther north he degenerates, becoming always more and more puny, dull, and stupid.

The wild goat, the chamois, and the marmot frequent the great mountain ranges of middle Europe, the Alps, the Pyrenees, the Carpathians, and the Balkans.

The animals that are found in the middle region are also, for the most part, common to the south. The ox and the horse in Italy, if well fed, are as stout as any in the Ukraine or in Holstein. The Arab horse was brought into the south of Europe by the Moors and the Turks; and perhaps from it have sprung the Andalusian and other varieties. It is still less doubtful that the buffalo has been imported from Asia into Southern Europe. A particular species of sheep in Sardinia, and another in Candia, are supposed to be indigenous. The Arabian camel has been introduced into Tuscany. The Bactrian camel thrives in the steppes of the Crimea and southern Russia, which likewise feeds large herds of Tartar horses.

Different races of inhabitants.

Europe is peopled by several very distinct races of men, distinct in respect of physiological characteristics, as well as of language. It would be quite out of place here, however, to discuss the principles of anthropology, ethnology, glossology, and comparative philology, or any of the important questions respecting the origin and affinities of nations, that have occupied the attention of the cultivators of these branches of science: we shall simply state what we believe to have been the results of their researches, with respect to the people and languages of Europe.

It has been inferred, chiefly from sepulchral remains, that at some very remote epoch the western parts of Europe were possessed by a people of a low degree of intellectual and social development, and it is supposed that they probably belonged to the same family of nations as the Iberians of Spain, or to a family, of which the Laps of Scandinavia are the modern representatives. The Iberians seem to have possessed, at one time, the whole of the Spanish peninsula, and even to have extended beyond the Pyrenees, far into France if not over the whole territory, and even into Italy and the islands of Corsica, Sardinia, and Sicily; but whether they belonged to the same family as the Laps, or were rather connected with the Berbers of Africa, is a point not yet, and perhaps not easily to be, determined. The Basques, who live in Biscay, Navarre, and the adjoining parts of France, and call themselves Euscaldunac, are believed to be the remains of this once great nation. At a very early epoch, which cannot be determined, these aboriginal races were intruded upon by people of the Gaelic, Celtic, or Keltic stock, who acquired possession of all France, Britain and Ireland, and subsequently penetrated into Spain, where they mingled with the Iberians, and produced the Celtiberians, and also into Italy, the northern part of which was called from them, Cisalpine Gaul, and so on to the head of the Adriatic Sea. Afterwards another people of kindred lineage, but speaking a language considerably different,

and known as the Cimbric, Kymraic, Cumbrians, or Cambrian race, acquired possession of the north of France, of all the southern parts of Britain, and of the eastern maritime Lowlands of Scotland, as far north at least as the river Spey, leaving the older Celts in possession of the north-western Highlands and Islands of Scotland and of all Ireland, and the southern and south-eastern parts of France. They seem likewise to have extended themselves along the German shores of the North Sea, as far as Jutland. The Iberians, the Kelts, and the Kymri, were the races that possessed the south-western countries of Europe at the dawn of history.

The north-east of Europe is the native seat of the Ugrian races, now best represented by the Finns; and people of this stock seem to have possessed the northern and north-eastern parts of Europe in the earliest times, extending from the shores of the Arctic Ocean and the White Sea, to the shores of the Euxine, and to have been the original Skuthians, whom we miscall Scythians; for though the name Cud, Scud, Czud, or Tschude, by which these people have been long known, and which is believed by Schaffarick to be the original of the Greek σκυθοι, is not a native name, but only applied to them by the Slavonians, yet the Sarmatians of old were themselves Slavonians, and the Greeks may have borrowed the name from them, and then in their ignorance applied it without distinction of races to all the people that lived to the north and east of the Black Sea. Jakob Grimm, however, prefers a Gothic etymology for *Skuthoi*, and supposes it to have been borrowed by the Greeks from the people of Thrace, who vaguely applied it to all the people farther north. At an early, but unknown epoch, Sarmatians, the ancestors of the modern Slavonic races, settled in the countries that lie to the north of the Black Sea, and seem to have pressed themselves gradually north-eastward upon the Ugrians, till they have nearly dispossessed them altogether of their country, while the Ugrians were pressed back in the same way from the south-east by Turkish and Tartar races. The modern Ugrian races are the Laps of Scandinavia, the Finns, and the Samoyeds and some other tribes of Russia, and the Majyars of Hungary.

Between the Sarmatians and the Skuthians of the east, and the Kelts and Kimbers of the west, the Gothic and Germanic races are found, at the dawn of history, pressing southward like a wedge; but where they came from, and how they found themselves on the shores of the Baltic at that epoch, it would be vain to inquire. They seem, however to have been very early divided into two great branches, one of which proceeded northwards to the conquest of Scandinavia, while the other directed their efforts southwards and westwards, till they became known to the Romans under the name of Germans. In the later times of the Roman empire, branches of this family were also in possession of Mœsia, and other countries to the north-west of the Black Sea, from which they have now entirely disappeared. From the northern branch of the Germanic race are descended the modern Swedes, Danes, Norwegians, and the natives of Iceland and the Faroe Islands; from the southern branch, the modern *Deutsch*, both high and low, or all the Deutsch inhabitants of Germany, Switzerland, France, and the Netherlands, and the English, and Lowland Scots, though the latter are indeed largely intermixed, with Gothic, Celtic, and Cambro-British blood.

The south-eastern peninsula of Europe is found possessed, at the earliest epoch, by races of unknown origin and lineage, who became in time the well-known Hellenes, or Greeks; and at an epoch at least as early, the neighbouring peninsula of Italy was possessed by races who seem to have gradually coalesced into *Latins* and *Romans*. With the conquests of the latter people, the Latin language was spread over Italy, France, and Spain, where it seems to have almost entirely superseded the aboriginal tongues, and laid the foundations of the modern languages of those countries. The Romans, after having brought all the nations of Italy, France, and Spain under subjection to their empire, were in their turn invaded and overthrown by the northern nations, various tribes of whom, under the names of Heruli, Ostro-Goths, Longobards, and others, penetrated into and settled in Italy; while Suevians and Visi-Goths settled in Spain, Franks and Burgundians in Gaul, Angles, Saxons, Jutes, and Frisians in Britain. In the first three of these countries, Italy, Spain, and France, so far were the invaders from extirpating the natives, that, on the contrary, they seem to have mixed freely with them, and to have rather adopted the languages they found prevailing than imposed their own. At this day indeed, the great bulk of the French people are believed to be of Keltic descent, and to retain the physical and mental characteristics of the Gauls, though most of them have entirely lost their ancestral language. In Britain the invaders seem to have preponderated over the natives, and entirely changed the language of the country, driving the unmixed natives into Wales, Cornwall, and Cumberland; and it is only in Wales that the Cambro-British language still lives. In the 11th century, England was invaded by a host of Normans and French; and from the gradual mixture of these with the Anglo-Saxons have been formed the modern English nation and language. Two or three centuries after settling in Spain, the Goths were dispossessed of that kingdom by Mohammedan invaders from Africa, a remnant of them taking refuge among the mountains of Asturias. In the course of seven centuries the descendants of these refugees recovered their lost possessions; and to have the blue blood of the Goths pure in his veins, is the proudest distinction of a Spaniard; so many of the nation being contaminated by the black (Moorish, not negro) blood of Africa. These pure Goths, however, are only the mixed descendants of Iberians, Celts, Carthaginians, Numidians, Romans, Suevians, Goths, and Vandals, from the last of whom the province of Andalusia (Vandalusia) takes its name.

The ancient inhabitants of the south-east of Europe are now represented by the Greeks, Albanians, and Wallachians. The Greeks not only occupy the new kingdom of Greece and the Ionian Islands, but are also spread over the provinces of Turkey and the adjoining parts of Russia and Austria. They have preserved the language and much of the character of the ancient Greeks. The Albanians, called also Arnauts and Skipetars, are believed to be the descendants of the ancient inhabitants of Albania, though mixed with Slavonic blood. The Wallachians, who possess Wallachia and Moldavia, and the adjoining parts of Hungary, Transylvania, and Bulgaria, and speaks a Roman language, are probably the descendants of the ancient Dacians, intermixed with a numerous Roman colony, which had been settled among them. Towards the end of the ninth century an Ugrian race settled in the ancient Pannonia, where they are now known by the names of Majyars in Hungary, and Szeklers in Transylvania.

The Tartars, who are spread over the south-eastern provinces of Russia, are believed to be the descendants of the Turkish portion of the armies of Zengis Khan, who invaded Europe in the thirteenth century, and whose successors domineered over the Muscovite Russians till the end of the fifteenth. In the sixteenth century they were dispossessed of their kingdoms of Kazan and Astrakhan, and subdued by the Muscovites, and their numbers are now very small in comparison with those of the ruling race. The Osmanli, or Ottoman Turks, a more important branch of the same family, first came into Europe in the fourteenth century, their third Sultan, Amurath, or Morad I., who reigned from 1358 to 1389, having then possessed himself of all Thrace, or Rumelia, and established his seat of government at Adrianople. In 1452, the Sultan Mohammed II. got pos

Europe. session by conquest of Constantinople, which has been ever since, not only the capital of Turkey, but also the metropolis of Islam, or the Mohammedan world. Since their great defeat at Vienna in 1683, the Turkish power has been declining, and to all appearance it will soon be swept out of Europe altogether. The Ottomans consider Asia Minor, or Anatolia, to be the home of their race, and seem quite prepared to cede Rumelia to whoever is able to take it. The Dobrudji (or Dobrudshee) Turks, a numerous tribe distinct from the Osmanli, possess the north-eastern corner of Bulgaria, between Shumla, the Danube, and the Black Sea. The total number of Mussulmans in European Turkey is estimated at about four and a half millions; but of the Ottoman Turks themselves the number is variously estimated between 700,000 and 2,100,000. The Turks seem to have come originally from Central Asia, and to have been of the Mongolian or yellow race of mankind. They seem, however, to have mingled freely with all the western nations among whom their conquests carried them, and from the intermixture has sprung a race who are but little different from natives of Caucasian origin. Some ethnographers, in consequence, believe them to have been even originally Caucasian; but it is certain that many Turks, even in Europe, still exhibit the strongest Mongolian forms and features, and that phenomenon seems to us to indicate that these are pure Turks, of the original stock, while their Caucasian brethren are of mixed descent.

With respect to physical characteristics, it may be said generally that the nations of the south-west and south, as French, Italian, Spaniards, Greeks, are melanous, or dark-complexioned, while the Gothic and German races are generally xanthous, or fair-complexioned, with blue or gray eyes, and fair hair. The former are lively and energetic, more imaginative and inventive than the northern races, but less persevering, and the more southern portions of them, indeed, fonder of idleness than of work. They are likewise more temperate in eating and drinking than the northerns, but more passionate and vindictive. The northerns, on the other hand, though less imaginative and inventive, are more thoughtful, serious, and persevering, and more addicted to pursuits that exercise the understanding than to those that merely amuse the fancy; but they are less temperate in eating and drinking, which may be ascribed to the influence of the colder climates under which they live. The Slavonic, Turkish, and Tartar races are all melanous, or dark, and, as compared with the western nations, still in a lower degree of civilization, and intellectual and industrial development. "In regard to physical form," says Dr Latham, "the Ugrians are light-haired rather than dark, many of them are red haired." Scheffer, however, in his *History of Lapland*, says, that though young women are indifferently handsome and of a clear skin, most of the men are swarthy, and the hair of both sexes is generally black and hard, very seldom yellow. Professor Berghaus says, that the skin of the Laps is yellow-brown, and they have brown hair and brown eyes; and that the hair of the Finns is sometimes black, sometimes blond, yellow-brown, or red, the face dirty brown, and the eyes gray.

Languages. Europe contains, in proportion to its area, a greater number of distinct and strikingly marked families of languages than any of the other quarters of the world. A careful division gives at least ten independent groups, though, in respect of language as well as geography, Europe forms, with a slight exception, only one great whole with western Asia. The greater number of its languages consist of members of the Indo-European family; a small proportion belongs to the Shemitic family; branches of various Tataric or Tartaric languages, spread from Asia into the very heart of Europe; in the north of Russia and Scandinavia various branches of the Finnish language are still spoken, and one branch—the Majyar—is found isolated in the centre of the continent. The Basque, solitary, and of unknown origin, still lingers among the western Pyrenees; a small remnant of a language, which is presumed to have been once spoken all over the Peninsula. A remarkable characteristic, however, of the European languages, is the fact that their linguistic connection is not supported by the physical family likeness of those who speak them; or, in other words, that nations of the same race do not always speak the same language, while, on the other hand, branches of the same language are spoken by people of different races; language being more changeable than physiological character. There is indeed abundant evidence to show that the principal physical characters of a people may be preserved through a long series of ages, in despite of climate, mixture of races, invasions of foreigners, progress of civilization, or other known influences; and that a type can long outlive the language, history, religion, customs, and recollections of those on whom it is impressed.

Of monosyllabic languages, such as the Chinese, there are none in Europe. Of the higher class, called agglutinizing languages, which express the idea itself by a fixed word, and its relations by letters or syllables loosely and mechanically joined with it, Europe furnishes examples in the Tartaric, Caucasian, and Majyar languages. The Tartaric languages form a continuous chain from the east of Asia to the centre of Europe, and exhibit in their numerous branches the remarkable peculiarity of improving steadily and regularly as they proceed westward. According to traditions current among the tribes that speak them, their first home must be sought for on the high table-lands of the Altai; and hence the name of *Altaic*, by which they are frequently designated in modern writings. The whole Tartaric family consists of two principal and essentially different branches; the Tartaric Proper in the east, consisting of the Tungusian, of which the Mantchoo is a variety, the Mongolian, and the Turkish; the European branch, in the west, comprehending the numerous branches of the Finnic, or, as the Slavonic races call it, the Tschudic. Only the Tungusian is not represented in Europe; all the others are found somewhere or other. The *Mongolian* appears in the Olot dialect spoken by the numerous Mongolian hordes that occupy the vast plains to the east and north of the Volga; and a small separated colony at the confluence of that river with the Samara. The Turkish is spoken in a comparatively small portion of Europe by a few millions of the Osmanli or Ottoman Turks in European Turkey, and several scattered tribes. Only the common people, however, in Turkey speak pure Turkish. The language of the more refined classes is filled with Arabic and Persian elements; and the more refined the language the more foreign elements it contains. Various dialects of the same language, but not essentially different from that of Turkey, are spoken by the Tartars of Russia. Those who dwell in the south, in the neighbourhood of the Caucasus, are called *Tartars;* to the west of the Ossetes, and on both sides of the Elburz, they appear as *Karatschai;* more numerous and powerful near the mouths of the Danube, as far as the Dneister, through the Crimea, and along the north side of the sea of Azof to Taganrog, and then again north of the Caucasus till they meet the Olot on the Volga, as *Nogai*; north and west of the Caspian Sea, and along the Ural river, as *Kirghiz;* then as *Tartars of Kasan;* then as the *Bashkirs*, in the valley of the Ural, mingled in the governments of Orenburg and Perm with the *Meshtscheryakes;* and finally, the tribes who speak the *Tshuwassian* dialect. Only the language of Kasan is, properly speaking, a written language.

Tartaric.

The Finnish family of languages, closely connected with each other by striking analogies, and best represented in its most perfect form, the Finnish proper, is sometimes called *Uralian*, or *Ugrian*, from the geographical situation of some important tribes, or Cudic, Scudic, Tzudic, Czudic,

or *Tschudic*,[1] from the name applied by the Slavonic Russians to all the Finnish tribes of the empire. Some of these dialects are spoken in the whole range of country along the Ural, by Samoyeds and Ostiakes, and are as yet but little known, some of the tribes being not even converted to Christianity. It has been, however, so far satisfactorily established that they are the parent stock from which is derived the now entirely disconnected Majyar. Their western neighbours are the Syryaenes, Permians, and Votyakes, whose languages differ slightly from the others, though they are not free from Russian and Tartaric mixture. The Tsheremisses and the Morduines are separated colonies of the same race on the banks of the Volga, and are commonly distinguished as the Bulgarian branch of the Finnish family. The literature of all these eastern dialects is almost entirely limited to translations of parts of the Bible. Of greater importance are the western dialects, **Lappic.** the *Lappic*, the *Finnish* proper, and the *Esthic*. The first extends from the White Sea and the Northern Ocean, over the northern parts of the Scandinavian peninsula, down to 60° N. Lat. The Finnish Proper, called by the Finns themselves *Suomi*, prevails in Finland, and the Esthic, in Esthonia, the northern part of Livonia, and the adjacent islands. These three languages have each several minor dialects, but they are all closely connected with each other. Quite cut off from their cognate races, surrounded by Slavonians and Wallachians, and mixed with Germans, Gypsies, Armenians, and Jews, **Majyar.** we find the Majyars in Hungary, who speak a language connected with the Finnish. It is not free from foreign elements; but in respect of structure and grammar, it is one of the most developed of all the Tartaric languages. It is mainly the same wherever it is spoken; but it is found pure only among the Cumanes, Jazyges, and Haiduks. A large Majyar population fills the western part of Hungary; those in the east, in Transylvania, are called *Szekler*. The name of their country indicates the race they belong to, *Hungary* being derived from their name Ugri, passing through the dialectic changes of Ungri, Hungri, and Hungari.

Caucasian. To the agglutinizing family likewise belong the languages of various tribes of the Caucasus, and the Basque in the Pyrenees. The former, the Caucasian languages, are as **Basque.** yet very imperfectly known to philologists. The Basque, a small but highly interesting relic of a once powerful family, still lives in a small strip of country at the innermost corner of the Bay of Biscay, along the French and Spanish frontiers, and some distance westward along the coast of Spain. The people who speak it call it the *Euscara*, and themselves *Euscaldunac*. It is divided into three dialects, not essentially different from each other, but entirely different from all the other languages of Europe, to none of which the Euscara shows any relation.

Shemitic family. The essential difference between the agglutinizing and the inflecting languages, is the power which the latter possess of representing the connection of idea and relation in the mind by a corresponding radical and inseparable connection of the two elements in the same word. Two great classes of languages constitute the great body of inflecting speech, namely the Shemitic and the Indo-European; but the former is now represented in Europe only by a single dialect, the *Maltese*, which was formerly considered to be a relic of the Phœnician, or old Punic, but is now more generally considered to belong to the Arabic stock. It is spoken in the island of Malta by the native inhabitants.

Indo-European. The rest of the languages of Europe belong to the great Indo-European family, which may be arranged into the *Arian*, *Pelasgic*, *Slavic*, *Celtic*, and *Germanic* groups, each of which has, or has had, some representative in Europe, though of very unequal extent and importance. The Arian group is almost confined to Asia, its chief representative in Europe being the humble and long despised dialect of the **Gypsy.** *Gypsies*, which that race have tenaciously preserved through centuries of the most lawless and most vagrant course of life. Though mixed with the words and elements of various other languages, especially Slavonic and Romanic, the various dialects spoken by the Gypsies in different parts of the world are essentially the same, and their descent can be satisfactorily traced back to a connection with the great Arian tongues of south-western Asia, and especially, in spite of degeneration and mixture, with the Sanscrit of India itself. **Armenian.** The *Armenian* is properly only an Asiatic language, but it is spoken in Europe by many thousands of Armenians, who, like the Gypsies, are scattered over south-eastern Europe, in various detached colonies. Though much changed in form and structure from the original Iranic, of which it seems to have been a branch, it still retains enough of the family likeness to connect it with the Arian group. The original character, however, of the old Iranic or Persian languages is most purely preserved and best represented in the Ossetic, the language of a small tribe on the very **Ossetic.** confines of Europe. The Ossetes dwell in the heart of the Caucasus, surrounded by alien races. History knows nothing about them; but their language shows at once their origin and connections. They call themselves by the old family name of *Iron*; and their language is almost identical in its grammar and words with the older dialects, and even a better representative of the Zend and the old Persian than the modern language of Iran or Persia itself.

Greek and Latin. Greek and Latin are the two languages that form the bases of the Pelasgic group of modern European tongues. At a period anterior to the dawn of history, the Greek in its oldest, and the Latin in its earliest form, are believed to have very closely resembled each other. The Latin generally bears the stamp of higher antiquity than the classic Greek, and resembles the Æolic more than the later dialects of the Hellenic tongue. Be that as it may, however, the Greek is now represented in Europe by the Romaic, or modern Greek language, which, in its present form, has more resemblance to the ancient Greek than any of the modern Latin languages have to the ancient Latin. It is spoken in the islands of the Archipelago, and of the western coast of Greece up to Corfu, in the Morea, and in Hellas Proper, and Rumelia, though interspersed with Turkish colonies, eastward to Constantinople. Near Taganrog, on the Sea of Azof, there is a small colony, and further south, on the western shore of that sea, there is a larger settlement of Greeks, surrounded by Slaves and Tartars. Greeks are settled also in all the towns of the Crimea, and along the shores of the Black Sea. But the *Hellenic*, or literary language of the modern Greeks, having been of late highly cultivated on the model of the ancient classic language, now differs very considerably from the vulgar Romaic. **Albanian.** The Albanian language has been commonly considered to be a descendant of the ancient Illyrian; but the presumption is now generally in favour of its descent from the same original stock as the Greek, from which, however, it must have been separated at a very early epoch, the forms which it has in common with the Greek more nearly resembling the oldest than any of the latest forms of that language. It is spoken by about a million and a half of people, who call themselves Schkipetars, while the Turks call them Arnauts. They live in Albania and those parts of Greece that lie immediately to the south of it, and extend eastward, with frequent interruptions, far into Bulgaria.

Latin branch. Latin, the language of the all-conquering Romans, was

[1] The first letter of this name is the Slavonic C, the sound of which cannot be properly represented by any combination of Roman letters. It is usually represented by Cz or Tz, as in Czar or Tzar, Priepecz or Priepetz, Galacz or Galatz, Czud or Tzud, or Tshoude.

Europe.

extended with their empire over the countries of south-western Europe, where it has left noble descendants in the French, Spanish, Portuguese, Romance or Provençal, and Italian languages. Of these the bulk of the words are substantially Latin, but the forms or inflexions and grammatical structure have been very much changed, though nowhere entirely destroyed. They have been largely mixed with words from other languages of the Gothic, Germanic, and Celtic stocks, and in Spain, from the Basque and Arabic also. As might have been expected, the Latin has remained purest in Italy, where not one-tenth, it is thought, of radical words is foreign. In Spanish, little more than the half of the radicals is Latin, but it has retained more of the Latin inflection than even the Italian. The Portuguese, originally only a provincial dialect of Spanish, still remains almost identical with it in respect of words and structure, but differs in respect of certain Spanish sounds, to which the Portuguese seems to have a national antipathy. The Provençal forms a sort of linguistic as well as geographical transition from those languages that have preserved most of the Latin, to the French, which is furthest removed from it. It is spoken in the south of France, where it is distinguished from French as the *langue d'oc*, while French is called the *langue d'oui*—the one using *oc*, the other *oui*, for the affirmative particle *yes*. It was formerly spoken more generally and more widely than at present, extending even beyond the Alps and the Pyrenees into Italy, Switzerland, and Spain. The French rose upon the ruins of the Provençal, and has now become the general, or, at least, the literary and official, language of the great French nation, and also of the Belgians, nearly a half of whom are Walloons, a people who speak a dialect of the French. All these five languages, however—Italian, French, Provençal, Spanish, and Portuguese—are divided into multitudes of provincial dialects, which ages of education will hardly suffice to destroy. Besides these noble branches of the old stem, there are two smaller branches isolated in Europe—The *Wallachian* and the *Rhæto-Romanic*. The former is spoken in Wallachia and Moldavia, in several dialects, by a people who call themselves *Romeni* or *Romenia*, a name by which they have been long known. Their language shows in its essential features a convincing relation to the Latin, although the words are, to a great extent, of foreign origin—a circumstance easily explained by their position, entirely cut off from Roman or Italian influence, and surrounded by races speaking entirely different languages. The most of the words are now Slavonic, Majyar, Turkish, Greek, or German; but there is enough left of pure Latin in the words, and still more in the structure and inflection, to establish beyond doubt its direct and immediate descent from the Latin. It was probably introduced in these countries by a Roman colony. The Rhæto-Romanic is the language of the canton of the Grisons in Switzerland, a portion of the ancient Rhætia. It is a much-mixed and neglected language, now bearing an essentially German character, grafted on its old Latin stock.

Slavonic.

The great Slavonic race which now occupies the eastern half of Europe, and threatens to extend its dominion over all the Continent, did not at first appear under that name in European history. By the ancient writers of Greece and Rome they were called *Sauromats* or *Sarmatians*, a name resembling in sound, and radically identical with, the name which the Slavonians now give themselves—viz., *Serbs*, *Sorabians*, or *Servians*. Their German neighbours call them *Wendes* or *Winds* (*Vendes* or *Vinds*). From the banks of the Dwina, in the north-east of Russia, to the Bohemian Erzgebirge in the west, and the Black Sea, the Adriatic, and the Archipelago in the south, some branch or other of the Slavic is spoken. The name *Slave* is derived by themselves from the word *Slava*, glory, and is a designation peculiarly gratifying to their national pride. Modern Slavonic scholars divide the great bulk of the Slavic languages into two branches—the western and the south-eastern; others simply into the eastern and the western. The south-eastern or eastern division contains the Russian, Bulgarian, and Illyrian languages; the western contains the Leckian or Polish, the Czech or Bohemian, the Sorabian, and the Polabian, the last of which is now extinct.

Russian.

The Russian extends over the greater part of the immense territory of European Russia, and reaches in the south, in a compact mass, through eastern Gallicia, into Hungary. Russian colonies are frequent among the Tartars and Finns of the Urals, and a narrow but compact band of Russians follows the course of the Volga, between Kalmucks and Tartars, down to the Caspian Sea, and up again in a line parallel to the Caucasus, until they meet the Russian population at the Sea of Azof. From the Polish, it is separated with tolerable accuracy by the political boundary line of Poland. It is spoken by upwards of thirty (Schafarick says thirty-eight) millions of people, and is considered to be one of the sweetest and pleasantest of the Slavic tongues. It is divided into three dialects—the Great Russian, the Malo-Russian of the south, and the White Russian in the west, each of these again being sub-divided into numerous smaller dialects. They are all united, however, by a common written language, the dialect of Moscow, an inferior branch of the Russian, much mixed with foreign elements, but spoken over all the central and northern part of Russia. The Malo-Russian is spoken in the south, beginning with Gallicia, and goes north of the Sea of Azof, even beyond the boundaries of the Russian proper. The Rusniaks or Ruthenians, in Red Russia, the Bukovine, Galicia, and the north-eastern part of Hungary, speak a variety of the Malo-Russian. In the south of Poland also, and in various parts of Wallachia and Moldavia, detached tribes of this nation are found. The Kozaks also, except those of the Don, who are more Russian, belong to the same race, which amounts altogether to more than 13,000,000 of people. The White Russian occupies a much smaller extent of country. It is spoken in Lithuania, a portion of White Russia, and Volhynia, and extends even to the south of the river Priepecz. Its peculiarities are mostly the same as those of the Malo-Russian; and what distinguishes it mostly from the other dialects is the very large admixture of Polish elements.

Bulgarian.

The Bulgarian is supposed to have been formerly spoken over the countries that formed the Bulgarian empire, extending up the Danube into Hungary as far as the Carpathian Mountains and the sources of the Theiss. The modern Bulgarian is now almost confined to the province of Bulgaria, to the south and east of the Danube, which, however, it crosses at its mouth, to follow the west bank of the Pruth. The Bulgarian is very unlike most of the Slavic languages, and has been largely intermixed with foreign elements of all the surrounding languages. The church Slavic, which has been considered the mother of all the living Slavonic tongues, seems to have been nothing more than one of many Slavic dialects, earlier developed and more cultivated than the rest; and historical evidence shows that this church, or old Slavic, the language of the great Slavic apostles, Cyril and Methodius, who flourished in the ninth century, was the old Bulgarian we have mentioned. Whatever it may have once been, the church Slavic is no longer a national tongue, but it remains as the common literary language of all the Slavic nations who belong to the Greek Church, the Russians, Bulgarians, and Vindes. During the middle ages it exercised a permanent influence on the style of authors, and, through them, on the language of the whole race; and it still speaks to them daily and hourly through the Bible and their books of ritual, though it is said that even many of the priests in Russia do not understand the sacred language of their official duties.

Europe.

Illyrian.

The Illyrian comprises, as a collective name, the Servian, Croatian, and Slovensi, three cognate dialects, forming one language, and occupying the north-western portion of the Turkish, and the adjoining parts of the Austrian, empires. Majyars and Germans meet it in the north and west; in the south it is bounded by the Adriatic; and on the east by a line drawn between Widdin and Temesvar. The Servian is spoken by more than a million of Servians, who live between the Danube and the Balkans. A large number of Servians likewise live in Hungary. It is subdivided into three distinct dialects, which extend into the provinces of of Herzegovina, Bosnia, Montenegro or Upper Albania, Dalmatia, Croatia, Syrmia, Slavonia, Banat, Central Hungary, and Servia. The Croatian, or Chorwatian, is spoken in the eastern portion of the linguistic territory occupied by the Illyrian. It mostly prevails in the districts of Agram, Kreus, and Warasdin. It is subdivided into two minor dialects. The Slovensi, or Vindish, is spoken principally in Styria, Carinthia, and Carniola, in the western part of Hungary, along the rivers Muhr and Raab, and in parts of Illyria and Istria. The people of these districts, amounting to more than a million, call themselves Slovensi, but are better known abroad as Vindes, a name that was formerly given by the Germans to all the Slavic nations.

Polish, &c.

Of the western branch of the Slavic languages the Leckian or Polish was once one of the most extended branches of the Slavic family, being spoken even by those tribes on both sides of the Oder that are now almost entirely Germanized, in Pomerania, the Mark, and Silesia. At present it occupies, in two dialects, only the country that is now inhabited by Poles. This includes, besides Poland proper, the adjoining part of western Russia, the Duchy of Posen, Cracow, Galicia, and Ludomiria, a small portion of Silesia, and the isolated colony of the Kassubes, on the coast of the Baltic, in Pomerania, containing altogether about ten millions of people. The Leckian has its name from the Lekhes, a tribe of unknown origin, but which yielded in the tenth century to that of the Poles.

Czekh.

The Czekh is the language of the Slavic inhabitants of Bohemia, Moravia, and north-western Hungary, besides a number of isolated settlements throughout the latter country of people usually called Slovaks. They amount altogether to about six millions. The Czekh, however, is not exclusively the language of Bohemia; for all around the frontier, and especially in the west, German largely prevails. The Moravian and Slovak branches of the Czekh are divided into numerous dialects.

Sorabian.

The Sorabian, or Vendish, once extending from the Baltic to Bohemia, and from the frontiers of Poland to the Elbe and the Saale, is now spoken by so few people that it is sometimes said to be extinct. It is still spoken, however, in some parts of Lusatia and Brandenburg. These Vindes are the descendants of a Slavic race that settled early in the very heart of Germany. They now amount to scarcely two hundred thousand people, and speak the two dialects of Upper and Lower Lusatia, which are again much subdivided, and contain a large admixture of German. These Vindes appear in history as Weteli or Wiltzi in Pomerania, as Obotrites in Mecklenburg, as Wagrians, Drewanians, &c. The language of the last-named tribe is still spoken by a few survivors of this ancient race. Protected by almost impassable marshes, and living in barren, sandy plains, they have long withstood the effects of time and invasion.

Connected with the Slavic family is the Lettic, subdivided into the Lithuanian, the Prussian, and the Lettic proper. The Lithuanian has alone preserved the characteristic seven cases and the dual of the Indo-European languages, and among the former some are so well preserved as to be even identically the same as those of the Sanscrit. It is especially important for the understanding of the cognate languages, especially the Slavic, being, as it were, the connecting-link between the latter and the other Indo-European languages. It is, however, now in use only among the common people of some portions of East Prussia, around the towns of Memel, Tilsit, Ragnit, Labiau, and Insterburg, and their eastern frontiers, to the number of about 200,000; and Schaffarik counts about 1,282,000 people of the same race in Russia. The Prussian language has become entirely extinct. It was spoken along the shores of the Baltic, between the Vistula and the Niemen, by about two millions of people, but has yielded to German intrusion. The Lettic proper is the popular language of Courland, the greater part of Livonia, and of the peninsula that separates the Curische Sea from the Baltic. It stands very nearly in the same relation to the Lithuanian as that of the Italian to the Latin, being a modernized dialect of the older tongue.

Germanic languages.

The Germanic class of Indo-European languages includes not only the German proper, or Deutsch, but also the languages of Sweden, Denmark, Norway, Iceland, and of those ancient nations known to the Romans as the Goths, and of the Anglo-Saxons, and their descendants the modern English and Lowland Scots. The Gothic is the oldest known of all the Germanic languages, and its oldest form, known to us by the fragments of the translation of the Bible made by their bishop, Ulphilas, who died A.D. 388, is the Mœso-Gothic, which was the language of the Goths who then dwelt in Mœsia (the modern Bulgaria and Servia). The next oldest form of the Gothic is the old Norse of Iceland, where, owing to its isolation, it has been preserved free from mixture and change. It is the basis of the modern languages of Norway, Denmark, and the Faroe Islands. Swedish and Danish, which belong to the same family, have suffered in proportion as they have come more into contact with the nations of the Continent. They contain many foreign elements, and the Danish especially has lost most of its original force and originality, chiefly through the influence of the German. Of the same kindred was the Anglo-Saxon, which has now been superseded in Britain by the modern English, which, though still retaining much of its Gothic patrimony, has lost almost all its inflections, and shows a strong tendency to return to the primeval monosyllabic form. It presents probably a greater and more recent mixture of various elements derived from all languages than any other in Europe, or perhaps in the world. The Anglo-Saxon has likewise disappeared from its ancient continental seat, though traces of its older forms may still be found in the low German dialects. Its nearest cognate, the *Frisian*, was one spoken all over the vast territory that extends along the northern shores of Germany between the Rhine and the Elbe, and to the north of the latter. It has ceased to be a national tongue, and to be used for literary purposes, but still lives as the popular language in all that region, and is preserved in great purity in West Friesland. The remaining languages which belong to the older or Gothic branch of the Germanic tongues may be called the low German, a name now limited to the Neder-Duitsch, which is the language of the Netherlands, and to the low German proper, so far as not spoken in Holland and Belgium. The Neder-Duitsch contains two principal dialects, the Dutch and the Flemish, the former holding its part of the Netherlands to the exclusion of every other language, the other struggling against the increasing power of the French. Dutch and Flemish are essentially the same language, the difference extending hardly beyond the different manners of writing them. The popular language of the countries between the Rhine and the Weser, and the Weser and the Elbe, where it is not Dutch or Frisian, is the Platt-Deutsch, which, though differing essentially from the Anglo-Saxon, closely approaches the Neder-Duitsch. It is softer and more flowing than the Ober-Deutsch, or high German, and delights in pure full vowels. It is spoken all along the northern coasts of Germany, Prussia, Courland,

and Livonia, and even far into the interior of these provinces.

High German, or what is called pre-eminently, the German language, prevails in the central and southern parts of Germany, and a cultivated dialect of it is the literary and official language of the whole country. As a separate language it is supposed to be as old at least as the Gothic, and is now considered as being divided into three principal dialects, the Suabian, the Bavaro-Austrian, and the Frankish. It has preserved more of the ancient grammar and inflection than the English, Dutch, or Danish; but, having lost many full and pure vowels, it is far inferior in that respect to the full-sounding, euphonious Swedish. It is spoken not only in Germany but also in the north-eastern parts of Switzerland, and in parts of Hungary and Transylvania, Sleswig and South Jutland, and to the east, mixed with low German, beyond the limits of Courland. Westward it extends beyond the Rhine into France, where the meeting of the French and German dialects may be traced very nearly by a line, drawn from the North Sea, between Gravelines and Calais to the vicinity of Aix-la-Chapelle, having Gravelines, Hasebrouk, Yprès, Courtray, Brussels, Tirlemont, Tongres, Maestricht, and Eupen to the north; and St Omer, Lille, Tournay, Nivelle, Waterloo, Jodoigne, Warem, Liege, and Limburg to the south. There, turning southwards, the line passes to the east of Malmedy and the west of Arlon. Entering France a little to the east of Longwy, and crossing the Moselle between Metz and Thionville, it follows the watershed between the Moselle and the Saar, and the crest of the Vosges to the Ballon d'Alsace, and thence passing to the north of Belfort, it crosses the Swiss frontier within twenty miles west of Basel. Through Switzerland the line crosses the Birse below Delsperg or Delemont, passes south-west by Bienne, Erlach, Morat or Murten, and Freiburg or Fribourg, where one half of the town speaks German and the other French, thence southward along the border of Vaud and Bern to the sources of the Saane, then follows the line of the Alps, to the Gemmi mountain, whence it crosses the Valais to Mont Rosa. About two-thirds of the Swiss are Germans.

Celtic.

For a long time the Celtic was considered to be a language that had no connection with any branch of the Indo-European family. It has now, however, been shown and generally admitted to be a branch of the family that must have been separated from the other branches at a very remote epoch. It is the language that has reached the farthest west in Europe; but is now confined to the remotest corners of Great Britain, Ireland, and France, where it maintains a precarious existence against the inroads of the national languages of these countries. It seems to have been once extensively spoken in Western Europe, occupying not only the British islands and France, but also the western and northern parts of Germany, Switzerland, northern Italy, and the countries even farther east round the head of the Adriatic. Celtic elements can even be traced in Greek, and still more certainly in Latin. At present there are four Celtic dialects, or varieties still spoken: the Gaelic, or Erse, in the Highlands and western islands of Scotland; the Irish in the south-western and western parts of Ireland; the Welsh in Wales and the adjoining borders of England; and the Armorian, or Breyzad, or Bas-Breton, in the departments of Finistere, Cotes du Nord, Morbihan, Ille and Vilaine, and Lower Loire, in France. The Erse of Scotland and the Irish are so nearly related that the more intelligent speakers of either can understand the other. They differ, however, very greatly from the Welsh and the Bas-Breton, which are distinguished as Cymric, and are probably less pure and unchanged than the Erse and Irish. The Manx language, spoken in the Isle of Man, in the Irish Sea, is a very impure Celtic dialect.

The numbers of people who speak these diverse languages cannot be precisely ascertained; the following statement, however, may be considered as an approximation at least to the relative proportions. The numbers of the Slavonians are those given by Schaffarick, dating so far back as 1826. but probably nearer the truth now than they were then, though even yet in some respects considerably exaggerated. The total number exceeds that of our general table, and the excess, we believe, lies principally in the Slavonian portion; the number assigned by Schaffarick to Austria exceeding the number given in the Gotha Almanac of the present year by 1,509,804.

I. German and Gothic.		
High and Low Deutsch or Germans	42,821,000	
Nieder-Duitch, and Flemings of Holland and Belgium	5,703,000	
Danes, Swedes, Norwegians	6,534,000	
		55,058,000
II. Latin.		
French, Provençal, and Walloon	37,243,000	
Spanish and Portuguese	17,053,000	
Italian	23,544,820	
Vallachian	3,000,000	
		80,840,820
III. English		27,625,862
IV. Slavonian.		
Muscovites, or Great Russians	35,314,000	
Malo or Little Russians and Ruthenians	10,370,000	
White Russians	2,726,000	
Bulgarians	3,587,000	
Servians and Illyrians	5,294,000	
Croats	801,000	
Carinthians	1,151,000	
Poles	9,365,000	
Bohemians and Moravians	4,414,000	
Slovacks, in Hungary	2,753,000	
Wends, in Lusatia	142,000	
		78,691,000
V. Letts and Lithuanians		1,588,993
VI. Finns, Laps, and other Ugrian races in Sweden, Norway, and Russia	3,519,620	
Majyars and Szeklers	6,000,000	
		9,519,620
VII. Turks and Tartars		3,500,000
VIII. Greeks and Albanians		2,500,000
IX. Basques or Euscaldunacs		650,000
X. Maltese		120,000
		260,094,295

We have not distinguished the Celts, Jews, Gypsies, and Armenians, because we have no means of ascertaining their respective numbers; and because, though they have all peculiar languages of their own, which they speak among themselves, yet they generally speak the languages of the countries in which they live, and are counted, as such, in the general amount of population. The Jews, however, in Europe are reckoned about 2,228,000.

Number of inhabitants.

The number of the inhabitants of Europe has been progressively increasing, slowly in the early part of the century, but more rapidly as we approach the present times. This is owing doubtless in a great degree to the long prevalence of a general peace; and, though, for the last 30 years or more, and especially within the last ten, emigration has been going on to an unprecedented extent, yet in many parts of Europe population is pressing too rapidly on the means of subsistence and employment, and would almost seem to require another general war, like that of the French revolution, to effect another clearance. It would however be quite out of place here to attempt to discuss the principles of population, sanitary improvement, and social progress, and the means of obviating the evils that arise from the ignorance and the barbarism that still prevail too largely among the masses of the people in all the countries of Europe, not excepting even the most favoured: we shall

Europe.

therefore content ourselves with stating here the numbers of the people of Europe at different periods, referring our readers to other articles for more minute information on the subjects we have hinted at.

The number in 1787 is said to have been.....	144,000,000
" at the peace of 1815...............	180,000,000
" in 1833, according to Balbi......	227,000,000
" in 1854, according to our table,	258,778,856

The first three of these enumerations we believe to have been in a great degree conjectural; and indeed it has been only within a comparatively recent period that measures have been taken by the governments of Europe to ascertain precisely the amount of the population of their respective countries. Even yet, in some of them, as in Spain and Turkey, the census is little better than a rough guess; and even when most correctly taken it is only an approximation to the truth; for we cannot get a general census of the whole of Europe taken on the same day, or even in the same year. Neither have we attempted to give the average number of inhabitants to each square mile, or what is called the relative population; because it seems to us that such averages are utterly futile, and worse than useless, unless the countries compared were entirely alike in the configuration of the ground, the quality of the soil, and the nature of the climate; in a word, possessed in every respect of the same natural qualities and advantages, and subject to the same social arrangements.

Religions.

With the trifling exception of a comparatively few Mohammedans, Jews, and heathens, the nations of Europe are professors of Christianity, and Europe collectively is distinguished from the realms of Islam by the title of Christendom. These professors, however, are divided into three great classes or churches, which not only hold no intercommunion, but are deadly rivals, conceiving it to be their duty to labour for the conversion at least, if not always avowedly for the extirpation, of each other. These are the Roman Catholic and the Protestant churches in Western Europe, and the Orthodox Greek church which domineers over the eastern half of the Continent. In the Roman Catholic and the Greek churches no differences of opinion, and consequently no sects, are permitted; but the Protestant church is divided into a multitude of rival sects, distinguished from each other by every variety of opinion respecting doctrine and discipline, and forms of worship. Some of these sects have been constituted into established national churches; but even these have been compelled, by the spirit of the age and the force of circumstances, to become tolerant, though the *odium theologicum* still occasionally shows itself, with all its proverbial bitterness.

The Roman Catholic or Latin church acknowledges the Pope or bishop of Rome as its spiritual sovereign, and the clergy are still numerous and wealthy. This church includes within its pale France, Belgium, Poland, Italy, Spain, and Portugal, and the greater part of the people of Ireland, and of the Austrian empire, about a half of the Prussians, Swiss, and Germans, and considerable numbers in Great Britain and the Netherlands.

The Greek church does not acknowledge the Pope; and though the Patriarch of Constantinople claims, as he once enjoyed, the same spiritual supremacy, his authority is now restricted to the limits of the Ottoman empire. The dominion of the church, indeed, extends over all the eastern half of Europe, including the Christian subjects of Russia, Turkey, and Greece, and a considerable number in Austria; but the Russians are subject to the authority of the Holy Synod of the Russian empire, of which the Czar is the spiritual as well as the temporal head; and in the new kingdom of Greece a similar Holy Synod has been constituted, with the king for its head. In Russia, dissent from the doctrines of the church is barely tolerated, yet there are within its limits various sectaries, all comprehended under the general name of *Raskolniks*, and frequently subjected to treatment little short of persecution.

Europe.

The principal sectaries of the Protestant church are distinguished as Lutherans, Calvinists, and Arminians. Lutheranism prevails in Prussia, Sweden, Denmark, Norway, Hanover, Saxony, Wirtemberg, and some others of the smaller German states, and in the Baltic provinces of Russia. It reckons also many members in Hungary and other provinces of Austria. The Lutherans do not absolutely condemn a hierarchy, but they do not admit the divine institution of the order of bishops. Their bishops therefore are generally no more than the name implies, mere superintendents or inspectors of their respective dioceses. Their prelates are in all cases subject to the political sovereigns of the respective states, who are recognised as heads of the church. In Sweden, however, the Lutheran prelates form one of the four orders of the legislature. In Denmark, Norway, and Iceland, they have no prerogatives that can give them political influence. In the Calvinistic churches the government is strictly republican, and they reject any other headship than that of Christ. Calvinism prevails in England, Scotland, Holland, the Swiss cantons of Bern, Basel, Zurich, Vaud, and Geneva, the Duchy of Nassau, the principalities of Electoral Hesse, Anhalt, and Lippe, in Germany, the departments of the Gard, Ardeche, Drôme, Lot-et-Garonne, and others in France, Hungary, Transylvania, and the military borders of Austria; and Calvinists are also numerous in Prussia. In Scotland and Holland the national churches are Calvinistic. In Great Britain generally the Calvinists are divided into two great classes, *Presbyterians* and *Congregationalists*, the former being governed in spiritual matters by local, provincial, and general councils, called kirk-sessions, presbyteries, synods, and general assemblies; in the latter, each congregation assuming the full status of a church, and exercising supreme ecclesiastical authority over its members. There is, however, substantially, little difference between the two classes in this respect; for the Presbyterians claim and exercise the right of seceding and constituting new churches as often as occasion requires, so that even in the pre-eminently Presbyterian Scotland (to say nothing at present of England and Ireland, and America) there have been existing at one time so many as six or seven separate and jealously rival Presbyterian churches; and there has been found no practical limit to the increase of their number by secession or disruption, so that even one minister and his congregation may legitimately constitute themselves into a Presbyterian church. Calvinists arrogate to themselves and their doctrines exclusively the titles of *Evangelical* and *Orthodox*.

The *Arminians* are opposed to Calvinists in respect of five points of doctrine, zealously held fast by the latter; and Arminian doctrine is now very prevalent among Protestants, especially in Holland and England, but Arminians nowhere form distinct acknowledged churches.

The name of *Episcopalians* is given to a numerous body of Protestants, who, in addition to the leading doctrines of Protestantism, maintain the divine origin and institution of episcopacy, and the unbroken transmission from the apostles of the "holy orders" of the clergy. To this class belongs the Established Church of England and Ireland, whose doctrines are contained in 39 articles, sanctioned by act of parliament, and which are understood to have been a compromise between conflicting opinions, so that all might be brought within the pale of the church. In its forms of worship this church has retained so much of the Romish liturgy, priestly costume, and ceremonies, as seemed consistent with scriptural principles. It has also retained the hierarchy, only substituting the king or queen regnant as the spiritual head of the church, instead of the pope. Its archbishops and bishops are lords of parliament, and appointed by the Crown. In respect, however, of both doctrine and

Europe.

ceremonies, the members of the United Church of England and Ireland are very divided among themselves, the great body being Arminian, while a smaller fraction profess to be evangelical, and not a few seem verging to popery. Episcopalians are somewhat numerous in Scotland, but the majority of them constitute a church of their own, quite independent of that of England.

Methodists are likewise a very numerous and influential body, particularly in England, and are under the spiritual authority of a "Conference," constituted only by their clergy, to the absolute exclusion of lay members. They are divided, however, like other sects; the bulk of them, called Wesleyan, being Arminians, and a smaller body, the followers of Whitfield, being Calvinists. Each of these, however, is divided into several bodies, forming so many separate churches, ruled by conferences of their own.

In 1817, the Lutherans and the Calvinists in the duchy of Nassau were united into one body, under the name of the *Evangelical Church.* Similar unions have since taken place in Paris, Frankfort, Prussia, Bavaria, Baden, Hesse, Anhalt-Bernburg, Waldeck, and other parts of Germany. But this union having been effected in most of these places by the influence of the civil authority, amounting almost to compulsion, is believed to be neither very sincere, nor likely to last.

But the task would be endless to mention in detail all the varieties of Protestant sects and churches; and, as it is impossible to obtain, in all cases, precise and trustworthy information respecting the number of people belonging to each, we have felt ourselves constrained to class them all together in the following table under the general name of Protestants.

Islam or *Mohammedanism*, is the religion professed by all the Ottoman and other Turks and Tartars in the Russian and Turkish empires, who are all *Soonee*, or orthodox; and those of Russia are under the spiritual charge of two grand muftis, one of whom resides at Kazan, and the other at Simferopol in the Crimea. Those of Turkey acknowledge the supremacy of the Sultan, as the representative and caliph, or vicegerent of their prophet, and, as such, the spiritual head of their religion; but under the Sultan the management of the Mohammedan church and its spiritual concerns is delegated to the Grand Mufti, or Sheikh-ul-Islam, who resides at Constantinople, and is also the chief of the *Ulema*, or body of the clergy and lawyers of the empire. *Judaism* is, of course, the religion of the Jews who are scattered over Europe. The great bulk are Talmudists, or receivers of all the traditions that have accumulated for ages, and almost overwhelmed and superseded the law as delivered by Moses; but they have no general head, either spiritual or temporal, no sacrifices, no temple, and no altar. They are waiting in patient expectation of the coming of the Messiah, their prophetic king, who is to gather them from their long dispersion, and lead them again in triumph to Jerusalem, loaded with the spoils of the Gentiles. A small body of Jews or Israelites, who reject the Talmud and traditions, and acknowledge only the law itself, are known by the name of Karaites, and have their headquarters in the Crimea. A few *heathens* are still to be found among the Ugrian tribes on the shores of the Frozen Ocean, and among the Kalmucks and other Mongols in the S.E. of Russia, on the shores of the Caspian Sea, and among the tribes of the Caucasus.

The following table conveys a general view of the numbers of people belonging to each of the principal religions professed in Europe, as given in the Weimar Almanac for 1837, and there is no reason to suppose that the relative proportions are changed to any considerable amount, except perhaps in Ireland, where, within a few years, through the effects of famine, pestilence, and emigration, the numbers of the Catholic population have been very considerably reduced. In the pre-eminently Catholic countries of Italy, Spain, and Portugal, though Protestant churches are not permitted, there are nevertheless very considerable numbers of foreign Protestants always resident; and in Sardinia, in particular, besides the churches of the Waldenses, which have been always allowed to exist among the valleys of the Alps, they have been allowed last year (1854) to erect one in Turin itself, to the great chagrin of the Catholic clergy. To the numbers of religionists after mentioned are to be added about 350,000 Armenians, a branch of the Oriental Church, quite distinct from the Arminians of Western Europe, scattered over the south-eastern parts of Europe; the Mohammedans of Turkey and Russia, about two or three millions; and the Pagans of the Arctic coasts and the Caucasus, the numbers of whom are not known, but are not very considerable.

Progress of civilization.

Europe has been gradually advancing from poverty and barbarism to wealth and refinement since the tenth century; but the progress of the different nations has been very unequal. No single cause has contributed so much to their improvement as commerce; and hence the first advances have always been made by maritime states; and the progress of the different communities has been nearly in proportion to their vicinity to the sea, or the facility of their communication with it. The small republics of Italy and the Hanse Towns were the seats of industry, wealth, knowledge, and freedom; while slavery, ignorance, and rapine, reigned in the countries around them. The tendency of commerce to enrich a country seems to depend on its power to create disposable capital. Though a certain species of opulence exists among the great land-holders of agricultural countries, those masses of disposable capital which give vigour to industry, and supply the means of great improvements, are only found in commercial states. Commerce also favours the growth of manufactures, and these two species of industry raise up a middle class, closely allied with the great body of the people. It is among this class that ideas of civil and religious liberty take their rise, and find their firmest supporters; whereas in countries entirely agricultural, liberty means only the domination of the aristocracy. The spirit of liberty once introduced, laws are improved, prejudices hostile to industry extinguished, and new vigour infused into every branch of society. It is thus that freedom and wealth have generally followed in the train of commerce; and that the commercial states have led the way in those improvements which have so much ameliorated the condition of Europe. When the Italian republics flourished, however, Europe was not in a state to be much benefited by the lights which their experience afforded. The Dutch republic, which flourished at a later period, gave a more striking demonstration of the advan-

Europe.

tages of industry, freedom, toleration, and good government, at a time when neither liberty nor toleration were understood even in England, and when industry was in a very low state all over Europe. The example of the Dutch furnished statesmen with new ideas, and had a sensible influence on the policy of England, France, and other countries. The genius of Peter the Great derived from this small republic the seeds of those improvements by which civilization was spread over the vast empire of Russia. The superiority which the Dutch possessed has since been transferred to Britain, and she has acquired with it the privilege of instructing other nations in the sources of public wealth and the science of government.

The Reformation had a material effect in accelerating the progress of society. It put an end to a multitude of abuses and prejudices adverse to improvement, and inspired the human mind with a new activity. Those countries in which it took no root seemed to have had their progress arrested; while others, less favoured by nature, derived new life and vigour from its influence. Italy and Spain, now so far behind Britain, France, and Germany, were the first countries in Europe for knowledge, wealth, and industry, at the period of the Reformation. The establishment of the Protestant religion has produced a more liberal spirit among the Catholics in those countries where the two churches exist together; but in those countries where Protestantism never obtained a footing, the dread of its introduction threw the government more and more into the hands of the clergy; the clergy, armed with power, became more jealous and intolerant, and nearly put an end to all freedom of thought. The literary glory of Spain expired some time after the Reformation; and Italy was checked in her career. The older writers of these countries breathe a spirit which would not be tolerated at the present day, nor does society there afford the elements out of which such characters could be formed. And thus it happened that the very same event which called forth the powers of the human mind in the north of Europe, extinguished the intellectual activity of the south.

The improved means of internal communication in countries in modern times have had a considerable effect upon the state of society. In ancient times free states were necessarily small, because when neither the press nor the post existed, that union of sentiment necessary to control the conduct of men in power could not be effected among a large population scattered over a wide space. A number of free states sprung up in Greece, because that country, divided by mountains and arms of the sea, afforded natural means of defence to such small societies as could then exercise the functions necessary to the preservation of freedom. It is a mistake to suppose that, in these states, a greater extent of territory could have been united under one government by adopting the representative system. The resolutions of a body of representatives would command no more respect from a government than those of as many private individuals, if they were not constantly supported by the opinions of the mass of society; and this requires such a rapid and general circulation of intelligence as could not then exist. The small size of the Grecian states was a necessary condition of their freedom; but it was a serious disadvantage, not only because it lessened the commercial intercourse between the different parts of the country, but because such small communities had not strength enough to resist a great force from without; and hence these states fell a prey to the superior power of the Macedonian monarchy. The whole of the south-west of Europe exhibits the physical features of Greece upon a larger scale. Its surface is broken into numerous sections by gulfs and mountains, and abounds in natural barriers. Favoured by these circumstances, the different communities in this quarter of the world in modern times enjoyed a certain degree of independence and security, which hastened their progress in civilization. Russia, which occupies the largest plain in Europe, has been the last reclaimed from barbarism, though still very far from being civilized. So long, however, as the means of communication remained very imperfect in modern Europe, free governments were confined to small states, and the larger states were abandoned to feudal tyranny or military despotism; but the science of government has gradually improved, as knowledge, commerce, and the arts have advanced; and at present the admirable inventions of the post and the press, steam navigation, railways, and the electric telegraph, give such a rapidity to the circulation of public sentiment, and such facilities for congregating multitudes of men, that twenty millions could be almost as easily united in defence of their rights as the small population of Attica in the time of Xerxes.

The progress of improvement tends to level all distinctions among states, but those founded on the extent of their natural resources. Capital, skill, intelligence, and all acquired advantages, tend to an equilibrium. When Europe was overrun with barbarism, the city of Venice, by its commercial wealth, was a counterpoise to two or three of the great monarchies of the continent. The discovery of America, and of a passage by sea to the East Indies, gave a new direction to commerce, and undermined the greatness of that city. The Dutch republic rose by its freedom and industry, and was able, in the time of Charles II., to dispute the empire of the sea with the combined powers of England and France. But England increased her commerce, and improved her constitution; and having a larger and more fertile territory, as well as a greater population, she obtained at length an ascendancy over Holland, deprived her of the empire of the sea, and stript her of most of her colonies. At the beginning of the seventeenth century, Spain and Turkey were the first powers in the west and east of Europe, and inspired their neighbours with the dread of conquest. Sweden ruled with undisputed sway in the north; and Russia, now so formidable, was scarcely known. Spain, under a better government, might recover a part of her influence; but the Turkish empire seems near its dissolution; and the importance of Sweden and Holland is gone irretrievably, in consequence of the growing strength of the neighbouring powers. The extent of territory and the immense natural resources of Russia must, in the end, render her highly dangerous to all the other powers of Europe, if the empire do not fall to pieces from its own weight, or get into disorder from the vices of its government, or the barbarism, ignorance, and corruption, of its people.

Commerce and manufactures.

During the last century the commerce and manufactures of Britain have been progressing continually and rapidly, and have now reached an enormous degree of development, without a parallel in the history of the world. The long peace has enabled the other states of Europe to direct their attention to the same means of wealth, and some of them, as France and Germany, have become very active and powerful competitors. Still, the natural advantages which Britain enjoys, her accumulated capital, and the spirit of her people, have enabled her to keep ahead in this rivalry. Her abundant supplies of iron and coal have made her the mechanical workshop of the world; and it is principally to British ingenuity, skill, and industry, and the application of British capital, that the states of Europe are indebted for the steam navigation, the railways, and the electric telegraph, by means of which they are now so intimately connected with each other and with the other quarters of the world. Britain is a hive of manufacturing industry, of which cotton goods, woollen cloth, and iron articles, are the principal branches. The same may be said only of some parts of France, and more generally of Belgium, Germany, and Switzerland. Of other countries the manufactures are unimportant; raw produce, and such quasi manufactures as

Europe.

pitch, tar, wine, and oil, forming the staple articles of their trade.

By means of steam-vessels, communication between all the maritime regions of Europe has been rendered easy and certain, while the seaboard has been connected with the inland regions by railways running in all directions. During the latter half of the last century, and the earlier part of the present, England was covered with a net-work of canals, forming navigable communication between all her principal towns and rivers. Belgium and Holland have long been famous for their canals. In France, likewise, the great rivers were connected in the same way, and the great canal of Languedoc formed a navigable communication between the Bay of Biscay and the Mediterranean Sea. In Prussia, likewise, and in Russia, the great rivers have been connected by canals; and in Sweden, the Gotha canal extends from the Cattegat at Gottenburg to the Baltic, near Stockholm, through the lakes Wener and Wetter. These very useful means of transport have now, however, been very much, if not entirely, superseded by railways. Of these, England is covered with a net-work, as she was with canals, and uninterrupted lines of communication extend from near the Land's End through Scotland to the Moray Firth. In Scotland, Ireland, France, and Germany, the principal cities and towns are connected by railways; and in Russia, we understand that one is forming to connect St Petersburg with Moscow and the Black Sea. In Italy, Milan and Venice are connected, and railways are projected at least in other parts of the country. The later invention of the electric telegraph is likewise extending everywhere across seas and continents; but the whole system of telegraphs and railways will be understood at once by a glance at a map, far more easily and more perfectly than from volumes of verbal description.

States.

Considered in respect of political constitution and civil government, the states of Europe may be arranged in six classes. The first class comprises 4 empires, the sovereigns of which are absolute monarchs; the second, 16 kingdoms, partly absolute and partly constitutional; the fourth, 7 grand-duchies, all monarchies; the fifth, 24 duchies and principalities, likewise all monarchies, partly constitutional and partly absolute; and the sixth, 32 republics. The third class comprises 2 nondescripts, both monarchies indeed; but, in the one case, the sovereign retains the subject title of Elector of the head of an empire that no longer exists, and the sovereign of the other is at once the spiritual sovereign of the Roman Catholic world, and the temporal sovereign of that portion of Italy called the States of the Church. The following table contains the names, territorial extent or area, and the population of these several states at the dates attached to them respectively. The grand total of the population, as it is not all of the same year, can only be considered as an approximation to the truth.

Names.	Area in Square English Miles.	Population.	Date.

NOTE.—The principality of *Monaco*, though nominally an independent sovereignty, is practically under the domination of Sardinia.

Europe. Finances.

In financial importance Britain stands at the head of all these states; for not only is her annual revenue the largest, excepting that of France, but she enjoys besides the unenviable pre-eminence of being burdened with the largest debt. The bad practice of anticipating revenue by borrowing money is common to them all; and, as will be seen in the table, only some of the less important have escaped the ever-growing evil. Within the last twenty years the debt of Austria has increased more than threefold, and now the French emperor is borrowing largely to pay the current expenses of the war in which he and the British government are engaged with Russia. The governments of Spain and Greece are virtually bankrupt, being neither able nor willing to pay either principal or interest of their large debts. Norway, on the contrary, the poorest country in Europe, has set the bright example of paying off that portion of the Danish debt with which she was burdened when separated from that monarchy in 1814, while the Danish portion has gone on increasing. The Ottoman Sultan has only escaped by virtue of his want of credit.

Country.	Annual Revenue.	Debt.
Great Britain and Ireland	£56,000,000	£760,000,000
France	62,000,000	275,000,000
Austria	25,000,000	180,000,000
Russia	35,000,000	170,000,000
Prussia	15,000,000	32,000,000
Spain	15,000,000	120,000,000
Turkey	6,500,000	... ...
Netherlands	6,000,000	100,000,000
Belgium	5,000,000	29,000,000
Denmark	1,500,000	13,750,000
Bavaria	3,000,000	16,146,000
The Two Sicilies	4,500,000	16,800,000
Sardinia	5,000,000	24,000,000
Hanover	1,300,000	5,474,000
Baden	1,680,000	5,485,000
States of the Church	2,381,000	20,000,000
Portugal	2,850,000	18,000,000
Kingdom of Saxony	1,650,000	6,500,000
Sweden	1,040,000	
Norway	650,000	None.
Tuscany	1,250,470	
Greece	860,000	4,176,000
Modena	340,000	
Parma	76,000	380,000
Wirtemberg	1,000,000	4,842,000
Smaller German States together	5,500,000	17,000,000
The Swiss Cantons all together	650,000	

Their annual revenues and the amount of their debts are stated in the above table, in the nearest round numbers, and in sterling money, which will give a sufficiently near approximation to sums that are constantly varying, and in many instances not certainly known.

Military forces.

Though there has been a general peace in Europe for the long period of forty years, yet their mutual jealousies have made it seem necessary to the Continental governments at least to maintain large standing armies. Russia, safe from foreign invasion, has long been preparing large armaments for purposes of aggression on her weaker neighbours, and of domination over all the rest; and at last her overt acts of aggression on Turkey have provoked a war with Great Britain and France, who have armed in defence of their ancient ally the Sultan, and with the view of not only maintaining the balance of power in Europe, but of effectually checking the undisguised attempts of the Czars of Russia at universal dominion. In these circumstances, with all Europe arming or beginning to arm, any numerical statements of their military forces, however approximately correct when written, may have become quite erroneous by the time they are published. The following table, therefore, contains only the declared numbers respectively of the peace and war establishments of the Continental armies, with the exception of that of France, which gives the actual number of men on foot, as stated in the emperor's address to his legislative council in December 1854.

Countries.	Peace.	War.
Austria	...	670,000

Maritime force.

The maritime powers that maintain efficient navies worth notice are, Britain, France, Russia, Austria, Turkey, Sardinia, Netherlands, Denmark, Sweden and Norway. In December 1854, the British fleet, in commission and actual service, consisted of 142 steamers and 104 sailing ships, with 63,000 men; that of France, of nearly the same number of vessels altogether, though not so many steamers, with 62,000 men. The Russian fleet in the spring of 1854 consisted of 52 line-of-battle ships, 48 frigates, and 84 smaller vessels (besides gun-boats), with 9000 guns and 62,000 men. Austria possessed 104 vessels carrying 742 guns; Turkey, 70 vessels, with 34,000 seamen and 4000 marines; Sardinia, 19 vessels, with 359 guns; the Netherlands, 88 vessels, with 2000 guns and 6180 men; Denmark, 120 vessels, with 883 guns, and 2000 men; Sweden, 74 vessels besides gun-boats; Norway, 19 ships besides gunboats, with 500 men.

In Europe there are two great national confederacies, the Germanic and the Swiss; but in neither of them is there so close a union of the sovereignties that compose it as there is in the United States of North America. In Germany, indeed, there is no principle or feeling of unity among either princes or people, and their confederation, as such, enjoys neither influence nor respect at home or abroad. In Switzerland, on the contrary, recent circumstances seem to have produced a closer and more intimate union, and given to the federative assembly the authority indispensable to the efficient working of a central government.

SKETCH OF THE SEVERAL STATES.

Britain.

Britain, though much smaller in extent than any of the other states of the first rank, is the wealthiest, and consequently the most powerful, of the whole. It enjoys a moderately good climate, rather cold and moist, but equable, a soil

and garrisoned by Sardinian troops. *Moldavia, Wallachia,* and *Servia* are independent only in respect of internal administration, but acknowledge the imperial sovereignty of the Ottoman Sultan. *Montenegro* is practically independent, under the rule of its Vladika, or hereditary bishop, but is not the less considered as an integral part of Turkey. *St Marino,* situated within the States of the Church, is under the protection and control of the Pope, as *Andorre* is of France. The *Ionian Islands* are likewise under the protection and control of the British Government, and garrisoned by British troops. *Kniphausen* is only a lordship, and *Hesse-Homburg* a landgraviate. The asterisks mark the smaller states of the Germanic Confederation.

Europe. less fertile in grain than that of France, but affording better pasturage, an extensive line of sea-coast, with numerous harbours, a natural and well-defined frontier, which no invading army can pass on foot, a good commercial position, and the largest fields of coal in Europe; but all these advantages have contributed less to her aggrandizement than the excellence of her laws and political constitution. The progress of Britain within the last hundred years, and especially within the last half century, has been wonderfully great. The British isles contain about 76,000,000 of acres, of which about two-thirds are in cultivation, and more than one-third waste or uncultivated. About half of the waste land is in Scotland, where the cultivated soil forms little more than a fourth part of the total area of the country, while in England it forms about 67 per cent., and in Ireland 70 per cent., of the surface. So great, however, has been the progress of agricultural improvement, that, though the population has doubled itself within the last fifty years, the production of food has fully kept pace with it. The progress of Britain in manufacturing industry has been still more rapid and more remarkable than even in agriculture; and in this respect her natural advantages are more exclusive. She has a good supply within herself of the raw material of her staple manufactures of woollen cloths, iron, and linen; and her means of procuring silk and cotton are equal at least to those of her neighbours. In enterprise and commercial activity, her merchants take the lead among the nations of Europe; and the removal of all restrictions, and the full introduction of the principles of free trade have given such a stimulus to their exertions as transcends all former example. The number of ships employed in her foreign and colonial trade in 1853 was 35,303, with a burden of 7,797,530 tons; and the number of registered British seamen was 253,896. Her military forces, in respect of numbers, make a very poor appearance beside those of the other great states; the peace establishment scarcely exceeding 120,000 men for colonial as well as home service. The amount, however, of her naval forces is more formidable. In December 1854, the number of seamen and marines on board the armed fleet was about 63,000.

France. France enjoys, upon the whole, greater natural advantages than any other country in Europe. Her territory is above a half larger than that of Great Britain and Ireland, and both her soil and climate are better,—the climate being less equable indeed, but there being a greater amount of summer heat to bring the fruits of the earth to perfection. She has a greater proportion of arable land than any of her neighbours; the natural means of communication throughout her provinces are abundant and easy; she is well provided with all the useful metals except tin; and is better supplied with coal than any other country of Europe but Britain. Even during the distractions of her great revolution, though her foreign trade was annihilated, her agriculture and manufactures were extended and improved, her population was increased, and its condition ameliorated. The surface of France contains about 128,000,000 of acres. It is estimated that, of this quantity, the waste land, including roads and rivers, amounts to an eighth part; the arable land to near a half; the woodland and pasture land and meadows, each to about a seventh; the vineyards to a twenty-fifth part; wild-land, quarries, buildings, orchards, gardens, olive and other plantations, making up the remainder. In addition to the vegetable productions that grow in England, the climate of France enables her to raise vines, olives, mulberries, and chestnuts. Wine and olive oil are two of her most valuable productions. The cotton trade has been for some time rapidly extending over the northern and eastern provinces; and Lyons has been long famous as the centre of the silk trade of Europe, a branch of manufacture that has been brought to great perfection in that city. The manufactures of woollen cloth, flax, hemp, and iron, are also very extensive, and have been carefully fostered under the protective system, which still prevails here, as elsewhere on the Continent, notwithstanding the example which has been set by Great Britain. Towards the end of the seventeenth century, the territory of France, then equal, or very nearly equal, to its present extent, appears to have contained about 20,000,000 of inhabitants. In 1791, it was found to be above 26,000,000, and in 1851 nearly 36,000,000. The government always maintains a large standing army, amounting on the peace establishment to about 350,000 men, but actually in December 1854 to 581,000. Her armed fleet on service is about equal in number of ships to that of Britain, with 62,000 men.

Netherlands. The seven northern provinces of the Netherlands are commonly called by the name of one of their number, Holland. They form a very low and flat country, many parts of which are from 10 to 20 feet below high-water mark on the adjoining sea-coasts; and altogether the country is so flat, that to those approaching it from the rivers, and some parts of the coast, the trees and spires seem to rise out of the water. It is defended from the sea and the rivers by huge dykes, the raising and maintaining of which has cost an enormous expense and amount of labour, and is a continual object of public solicitude. It is everywhere intersected by sluggish rivers and canals; and in consequence of so much water, and its unsheltered exposure to the sea breeze, the climate is humid and foggy; but, notwithstanding all disadvantages, the industry of the people has multiplied cattle and pasture-grounds; and besides these, wheat, flax, and madder, are raised in the northern districts; and in the south tobacco and different kinds of fruit-trees cover the fields. The area of the country contains about 7,614,000 English acres, of which about two-thirds are cultivated, the remainder being waste, or occupied by water, heaths, and peat-bogs. It is inhabited by the *Dutch*, a branch of the Low German family of nations, who, besides being patient and persevering agriculturists, are also largely engaged in foreign commerce. The population amounted at 31st December 1853 to 3,203,232, being an increase of 35,226 on the numbers of the preceding year. The army on permanent duty amounted to 20,488; the naval force to 6087 men, of whom 2322 were employed in the service of the Indian Archipelago.

Belgium. The people of the southern provinces have assumed the national name of Belgians (Belges), from the *Belgæ*, by whom the country was inhabited in the days of Julius Cæsar; though there is no reason to suppose that there is much, if any, family connection between them. They consist of two distinct nations, the Flamandes or Flemings, who inhabit the northern provinces to the number of about 2,500,000, speaking a dialect of the Low Dutch; and of Walloons and French, who inhabit the southern parts of the country to the number of about 2,000,000. French is the official language of government, and great efforts have been made to extend its domain, but the national spirit of the Flemings has been roused to the defence of their native tongue, and there has been a great revival of Flemish literature, while French literature in Belgium has not made the same progress. The Catholic party, which predominates in the north, has endeavoured to turn the spirit thus excited to its own purposes, and the kingdom is divided against itself. The southern part of Belgium is rather high and rugged, but to the north the country sinks into a flat plain, traversed by rivers and canals, diversified by woods, arable fields, and meadows, and thickly studded with towns and villages. The inhabitants are renowned for their industry and manufacturing talent, and every effort has been made by the government to foster improvements. The principal towns are connected with each other, and with France and Germany, by railways. There are large deposits of coal and iron, and the iron trade is carried on with great activity, particularly at, and in the neighbourhood of, Liège. A perpetual obligatory neutrality having been imposed upon Belgium by

Europe.

the treaties of 1831 and 1839, by virtue of which the kingdom was constituted, the naval and military forces are consequently unimportant.

Switzerland.

Switzerland is a country of mountains and valleys and lakes, and the cultivable soil forms but a small proportion of its area. It is the highest ground in Europe, and sends out large rivers to both the North Sea and the Mediterranean. Agriculture and pasturage are the prevalent branches of industry; but the cotton manufacture has likewise been introduced, and is carried on to a considerable extent in some places. The north-eastern part of the country is inhabited by Germans, or people who speak dialects of the German language; the south-western parts by people who speak French; the canton of the Grisons by people who speak a dialect of the old Romance, or bastard Latin, and the canton of Tessin by people who speak Italian. The neutrality of Switzerland is likewise allowed by its neighbours, and its independence guaranteed by the great powers. It is divided into 22 cantons, which form 25 sovereign states; but, in consequence of recent events, they have all become subjected to a central federal government, which controls their movements.

This confederation was formerly almost as loose as that of the German states; but the Jesuits having got possession of Lucerne, a *sonderbund*, or separate league, was entered into by the Roman Catholic or Forest Cantons for the defence of the holy fathers and their unpopular institutions against the attempts that might be made by the other cantons, or the general confederacy, to dislodge them. A short war, ending in the defeat of the troops of the Sonderbund, and the capture of Lucerne, left the Forest Cantons at the mercy of the General Confederation, and a new Federal Constitution was formed and adopted by the Federal Diet, Sept. 12, 1848. The sovereignty of Switzerland is vested in the Federal Assembly, consisting of two divisions, namely, the National Council, and the Council of the States. The members of the former are nominated in the cantons, in the proportion of one representative for 20,000 inhabitants; and the latter consists of 44 senators, two for each entire canton, and one for each half of the divided cantons. The Federal Assembly chooses among all the Swiss citizens who are eligible for the National Council a Federal Council, consisting of seven members, who continue in office for three years. After every entire election of the National Council, the Federal Council is also renewed; and over all these is a president and a vice-president of the Confederation, nominated annually in a conjoined sitting of the two sovereign authorities, and not re-eligible for a year. Only the Confederation, represented by the two councils, has the right of making war and peace, and treaties of alliance, commerce, and customs; and it is only the Confederation, and not the separate cantons, that has official relations with foreign governments, and regulates the general posts and tolls. The city of Bern was selected in Nov. 1848 to be the Federal capital.

Germany.

Germany occupies a large portion of the middle region of Europe, lying nearly across the Continent, from the head of the Adriatic Sea to the Baltic. The southern provinces consist of large elevated plains and valleys, bordered by lofty mountains; but towards the N. it sinks into a plain, or flat country, of seemingly boundless extent, intersected by the large rivers that flow from the southern mountains. The climate is naturally modified by the configuration of the ground. In the northern plains it is not cold, but humid and variable; in the higher country to the S. it is drier, but also, owing to the elevation, colder, or, to speak more correctly, liable to greater extremes of heat in summer and of cold in winter. Grain of almost every kind is cultivated, and produced in abundance; and in the valley of the Rhine the vine is cultivated as far N. as 51°. Wine is likewise produced in the lower and more sheltered valleys of the S. and E. The great bulk of the people are agricultural, but manufacturing industry is also very widely extended in various provinces. A large portion of the country is included in one or other of the two great rival monarchies of Austria and Prussia; the remainder is divided into a number of petty states, which form, with Austria and Prussia, the Germanic confederation. The people call themselves *Deutsch;* and are divided in respect of language into the two great families of Hoch Deutsch and Platt Deutsch, or High Dutch and Low Dutch, who speak dialects of German that differ very considerably. The general literary language of the country is a modified and refined form of the High Dutch, first devised, it is said, by Luther, in his translation of the Bible. Before the dissolution of the "Holy Roman Empire," in 1806, in consequence of the wars of the French Revolution, Germany was parcelled out among upwards of 300 sovereign states, including in the number about 50 free imperial cities. At the general settlement of the affairs of Europe, at the congress of Vienna, only 40 of these were allowed to recover or retain their independence; and by compact, of date 8th June 1815, these formed themselves into a *bund* or confederation, the object of which was the maintenance of the external and internal security of Germany, and the independence and inviolability of the confederated states.

The confederation was to be represented by a federal diet, composed of the plenipotentiaries of all the states, and of which the plenipotentiary of Austria was to be always the president. The diet held its sittings at Frankfort-on-the-Maine, and was to have at its disposal a fund contributed by the members, and a federal army to be furnished by the states in the proportion of one soldier for every 100 inhabitants for the active army, and of one in 200 for the army of reserve. The army when assembled was to be commanded by a general named by the diet, and was to be arranged in ten active divisions, and one division of infantry of reserve. Of these

	Men.
Austria was to furnish the 1st, 2d, and 3d, amounting to	94,822
Prussia, the 4th, 5th, and 6th	79,484
Bavaria, the 7th	35,600
Wirtemberg, Baden, and Darmstadt, the 8th	30,150
Saxony, Cassel, Nassau, and Luxemburg, the 9th	23,263
Hanover, Holstein, Lauenburg, Mecklenburg, Oldenburg, Brunswick, Hamburg, Lubeck, and Bremen, the 10th	28,067
And the 11th division to complete the garrisons of the federal fortresses, to be furnished by the Saxon duchies, Anhalt, Schwartzburg, Hohenzollern, Liechtenstein, Waldeck, Reuss, Lippe, Homburg, and Frankfort	10,902
Original force of the federal army	302,288

These are the numbers of the contingents as originally allocated in 1815; but a report recently published by the military commission of the diet at Frankfort shows the total strength of the federal army (being the sum of the federal contingents) to be now 525,037 men, constituted as follows:—

Divisions.		Men.
I. II. III.	Austria	153,295
IV. V. VI.	Prussia	170,509
VII.	Bavaria	50,236
VIII.	Wirtemberg, Baden, Hesse-Darmstadt	47,557
IX.	Saxony, Electoral Hesse, Nassau, Luxemburg, Limburg	35,336
X.	Hanover, Brunswick, Oldenburg, the Hanseatic towns, Mecklenburg	49,918
Reserve division of infantry		18,186
	Total	525,037

These are distributed among the different arms as follows:—

Infantry (of whom 28,621 are sharpshooters)	404,502
Cavalry (with 72,032 horses)	71,149
Artillery (with 7424 horses)	40,270
Engineers	5,745
On the different staffs	3,371
Total	525,037

Europe.

In addition to the above are—

Surgeons	1,470
Transport department	16,838

The siege artillery consists of 250 guns—viz. 122 cannon, 31 howitzers, and 97 mortars. The whole is tactically subdivided into 387 battalions, 409 squadrons, and 147 batteries, consisting of 1122 guns.

A recent plan for a new federal military constitution contemplates, besides an increase of 50,000 men in all, an increase of the artillery to the proportion of $2\frac{1}{2}$ guns to every 1000 men, instead of 2 to every 1000 as at present, and a reduction of the proportion of the cavalry to the infantry from one-seventh to one-eighth, on the ground that the increase of 50,000 men will be applied chiefly to garrison purposes. Whenever there is the least prospect of a federal mobilization, the unsatisfactory state of the contingents of the petty states is brought into greater prominence, but is always smoothed over by one or other of the greater powers for their own political connection's sake. Should the federal army ever be brought into the field there would be little more than the first seven divisions available, say 400,000; on the other hand, Austria and Prussia would always have further forces over and above their contingents, which they would willingly enough bring into federal service, as by that means the troops would be kept at federal cost, and, at the same time, procure a proportionate amount of ascendency for the nation to which they belong. One of the most faulty is the medical department: some small contingents have no surgeon at all; while one contingent has eight surgeons, another, of similar strength, has one. In exact proportion to the poverty and the mismanagement of these petty states is their pride and repulsive tendency, so that anything like an arrangement among themselves for a medical staff at joint expense is next to impossible.

The fortresses belonging to the confederation are Mentz, Luxemburg, and Landau.

From the first this confederation proved itself utterly inefficient for its intended purposes, and in 1848, in consequence of the spirit of revolution proceeding from France, the diet was superseded by a national assembly, which met at Frankfort and assumed sovereign powers, to which the princes of most of the states at least tacitly submitted. They appointed, or at least confirmed the appointment made by the diet, of the Austrian archduke John, as vicar of the empire, to administer its affairs till the election of an emperor or general sovereign. They established a national fleet; made war on the king of Denmark, for the purpose of wresting the duchies of Holstein and Schleswig from the Danish monarchy, and uniting them completely to the empire; and offered the imperial crown to the King of Prussia, which His Majesty felt himself constrained by circumstances reluctantly to decline. Their army, however, was beaten by the Danes, and re-action having commenced, all their projects proved abortive, and the assembly was dissolved. The vicar resigned his office in December 1849, when a series of negotiations ensued among the states with a view to the re-establishment of the *bund*, on such principles and with such powers as would ensure its efficient working for the general welfare of the German nation; but owing to their mutual jealousies, and more especially to the rivalry and irreconcileable pretensions of the two great powers, Austria and Prussia, these negotiations have had no more important result than the renewal of the federal compact of 1815, in all its inefficiency. It may be considered indeed as virtually dissolved, for the diet has no power of self-action, and no imperial authority; there is no central executive government; and there are no means of ensuring the combined action of the members for any object whatever, either civil or military. In the confederation are included the German provinces of Austria, Prussia, Denmark, and Holland, viz.—

Europe.

	Area in Square German Miles.	Population.
Austrian provinces	3,580	11,893,182

Zollverein.

In spite of the division of Germany into so many states, each possessing a right of toll, and its own custom-house regulations, the commerce of the country was very active and extensive, and promises to become continually more so through the operation of the *Zollverein*, or Great Customs Union, entered into very recently by most of the states at the suggestion and under the influence of Prussia, with the object of freeing the trade of Germany from the restrictions under which it was laid by the conflicting interests and regulations of so many separate and independent states, and the rapacity of so many needy princes. Tolls, therefore, or customs, are collected once for all at the general boundary of the states, and the produce is divided among them in certain proportions according to their interests. From this union, as it subsisted before the epoch of the revolutionary movements of 1848–9, Austria was excluded; but though not yet admitted into the union, Austria has become connected with it by a commercial treaty made with Prussia in 1853, the main principle of which is that the contracting parties should do nothing to prevent the free circulation of articles of trade in their respective territories, or absolutely prohibit the importation or exportation, or the transit, of any article of merchandise whatever, except tobacco, salt, gunpowder, playing-cards, and almanacs; the principal of these excepted articles, tobacco, being a government monopoly in Austria, but not in the other states. The duration of this treaty has been limited to 12 years from Jan. 1, 1854; and the members of the Zollverein have not only declared their adhesion to it, but have also prolonged till Dec. 31, 1865, the different conventions by virtue of which their union has been constituted.

The Zollverein includes Prussia, and all the minor German states, except—1. in the north of Germany, Holstein, with the portions of other states within its limits, Lauenburg, Mecklenburg, Hamburg, Lubeck, and Bremen; 2. in the south, the small principality of Liechtenstein, which is connected with the Austrian customs. Holstein, with the scattered portions of Oldenburg, Hamburg, and Lubeck inclosed within it, has been definitively incorporated with the Danish customs; but the duchy of Lauenburg has been left unattached, probably on account of its position, which enables it to profit by the transit of merchandise between Hamburg and Lubeck, and its tolls on the Elbe, which would become less productive and less profitable were it connected with either of the general systems of customs.

Austria.

The Austrian empire is one-fourth larger than France, and twice as large as Great Britain and Ireland together. It is almost entirely inland, having only a small extent of sea-coast, along the Adriatic. The south-western part is very mountainous; the northern contains the large plains of Hungary, Bohemia, and others, surrounded by mountains; and to the S. of the Alps lie the fertile plains of Lombardy and Venice. The climate is similar to that of France, but subject to greater extremes of heat and cold: the soil not much inferior, the grain and fruits nearly the same. Austria is richer in mineral wealth than any other state in Europe, and possesses coal, though not in great abundance. Iron of the best quality is found in Styria, Carinthia, and Lower Austria, and production is only limited by the want of fuel to smelt the ore. Quicksilver is found in abundance

Europe.

at Idria, in Carniola; and copper, zinc, sulphur, and various other metals and minerals of commercial value, are found in various places. Mines of rock-salt may be said to extend at intervals through Transylvania, Galicia, Hungary, Austria, Styria, and Tyrol; and those of Bochnia and Wielecska in Galicia are the largest salt workings in Europe. The land under tillage is about 34 per cent. of the total area; vines, orchards, and gardens, 3 per cent.; grass-land, 17 per cent.; forests and woodland, 26 per cent.; heaths, marshes, lakes, mountains, and other unproductive and uncultivable ground, 20 per cent. The cultivable soil, however, is fertile in grain; flax, hemp, hops, and fruits are extensively cultivated, and the forests furnish an ample supply of wood. The leading manufactures are linen, cotton, woollen, silk, leather, and works in metal and wood. The linen manufacture is carried on to the greatest extent in Bohemia and Moravia. Lombardy is the seat of the silk trade. The foreign trade is trifling, owing chiefly to her inland situation, want of navigable rivers, and the obstruction of mountains; but, by the introduction of steam navigation on the Danube, and the connection of her provinces with each other, and with other states, by means of railways, these disadvantages are in the way of being obviated or removed. Till 1848, the Austrian empire consisted of six distinct nations, with as many separate governments feebly united under one head. Now, however, the principle of centralization has been, and is continually being, more and more acted upon and enforced; and that, together with the removal or overcoming of the physical causes of separation, should naturally be followed by an increase of wealth, and strength, and political influence.

Prussia.

The Prussian territory is not much more than two-fifths of the size of that of Austria, and the larger portion of it lies within the limits of the great and comparatively barren plain which extends from the Bohemian and Carpathian Mountains to the Baltic Sea. The smaller and more fertile part of the Prussian territory, called the grand-duchy of the Lower Rhine, lies in the lower part of the basin of that river, and is separated from the main body of the kingdom by the intervention of Hanover, Saxony, and other German states. There are, besides, several smaller districts, scattered in the heart of Germany; and with a territory thus scattered and disjointed, the rank of Prussia as a great state has been sustained chiefly through the superiority of her internal organization, and the wary, temporising, and even shuffling policy of her government; forced upon them indeed by the defencelessness of a kingdom without natural frontiers, or physical centrality, or a people united by language, and national feeling, and interest. Agriculture is the chief occupation of the people, but in the Rhenish provinces the cotton, and in Silesia the linen manufactures are carried on to a great and increasing extent. Prussia necessarily maintains a large standing army, but has no naval power; the king, however, has recently purchased the port of Jahde from the Grand Duke of Oldenburg, for the purpose of a naval station, and has begun the formation of a fleet. The kingdom was, till recently, an absolute monarchy; but has now received a constitution.

Denmark.

Denmark is a portion of the great European plain, and may be described as almost uniformly level, with partial inequalities of surface, particularly in Schleswig and Holstein, and the islands of Funen and Zealand. The kingdom consists of two great divisions, the one a long peninsula, extending from the Elbe to the Scaggerrack, and the other a cluster of islands separating the Cattegat from the East Sea. The western coasts of the peninsula are a continuous level of marsh-land; the interior is dry and sandy; and the islands partake of the same characteristics. The soil of the lowlands is generally fertile, producing the finest pasture, and excellent corn crops. The climate is milder than the northern situation of the country would indicate; but the sky is very frequently obscured with vapours and moist fogs, and the summer lasts only from June till the middle of August. The climate, however, is not unwholesome. The mass of the population consists of Danes, who occupy the islands, North Jutland, and the northern part of Schleswig. Germans occupy the southern part of Schleswig, Holstein, and Lauenburg: Frisons and Angles live on the islands and other parts of the W. coasts. Agriculture and fisheries are their principal occupations. From 1660 till 1848 the kingdom was an absolute monarchy; but in the latter year a constitution was granted by the king; and the legislative power is now vested in two parliamentary bodies, the *Volksthing* and *Landesthing*, both consisting of elective members; the former resembling the House of Representatives, and the latter the Senate, of the Congress of the United States of North America, rather than the Lords and Commons of Great Britain. Denmark is a small and poor country, and her naval and military power corresponds with her small resources. She possesses in Europe the Faeroe Islands, and the large, volcanic, and poor island of Iceland, with a portion of West Greenland.

Sweden and Norway.

Sweden and Norway together occupy the Scandinavian peninsula, which consists of a huge mass of mountains, falling abruptly towards the Western Ocean, and in a series of long slopes towards the East Sea. More than a third part of the peninsula is more than 2000 feet above the level of the sea, and about 3700 square English miles of its surface are within the limits of perpetual snow. Of these elevated and snowy regions nearly 3000 square miles of the latter, and almost the whole of the former, are in Norway. The country possesses a great diversity of soil and climate. The summer of the lowlands of Sweden is warm and dry, but very short; the winters are long and severe. The climate, however, is generally wholesome and invigorating. The climate of Norway is less extreme; not so warm in summer, nor so cold in winter, but more humid and changeable than that of Sweden, and generally less salubrious. Agriculture and fisheries are the principal employments of the population. Sweden possesses mines of iron of the best quality, which are wrought with advantage. Sweden and Norway form two distinct states, with separate governments, but are united under one crown. Sweden possesses the form at least of a constitutional government; but, hitherto, has derived very little advantage from it in respect of social or material improvement; while, on the contrary, Norway, with a democratic constitution, has been steadily advancing since the epoch of her separation from Denmark and union with the crown of Sweden, in 1814. The military and naval power of both states is insignificant; and the country is too poor to maintain or require any considerable amount of foreign trade. Iron and timber are the principal articles of export.

Russian empire.

The Russian empire embraces nearly a half of the surface of Europe. It chiefly consists of an enormous plain, being little diversified by rising ground, except towards the Urals and the Caucasus in the S. and E., and in the province of Finland in the N.W. The northern part of the country is a cold and barren region of heaths and marshes; the central provinces are rich and fertile; the southern, mere steppes, or grassy, sandy, and salt plains, which afford, however, in their hollows, along the river-courses, abundance of excellent pasturage for cattle and horses. The population is chiefly agricultural, or nomadic; and the manufactures that are to be found in some places are more indebted to the fostering care of the government, and the high import duties, or absolute prohibition of foreign wares, than to native enterprise, for their origin and continuance. Russia is an immense military power, so far as that depends on the numbers of her armies; but the want of national wealth is such a drawback on military enterprise as she has not yet been able to overcome.

The origin of the Russians as a distinct branch of the

Europe. Slavonians, is a moot point among archæologists. They seem to have borne at one time the name of Antes, consisting of several tribes that formed a sort of confederation. In the ninth century, Ruric the Varangian, established himself in Novgorod the Great; and his successors, extending their dominion by conquest, established their capital at Kieff, where the dynasty reached the zenith of its power under Vladimir the Great, who introduced Christianity among his subjects, according to the creed and ritual of the Greek Church, A.D. 983. His empire was subsequently overthrown by the Poles and Lithuanians, and the greater part of it remained subject to Poland till the accession of the house of Romanoff. The eastern provinces beyond the Dneiper were conquered by Tartars, and remained under their dominion till the sixteenth century. The city of Moscow was founded by Andrey I. in A.D. 1156. In the middle of the fifteenth century, Ivan Vassiliwitz, Duke of Muscovy, recovered his independence, and having subdued a number of petty chieftains, and added the duchies of Tver and Novgorod to his dominions, assumed the title of Grand-duke. His grandson, of the same name, subdued the Tartar kingdoms of Kazan and Astrakhan, and assumed the title of Czar or Great King. In 1598 the race of Ruric became extinct; and after a period of anarchy, Michael Romanoff, the grandson, by the mother's side, of the last czar, was raised to the throne of the czars in 1613. His grandson, Peter Alexowitz, reformed the institutions of his empire, beat the Swedes and the Turks, acquired a footing on the Black Sea and the Baltic, founded St Petersburg, and assumed the titles of Emperor and Autocrator. With his grandson, Peter II., the male line of the family of Romanoff became extinct; but in 1763 the founder of the existing German dynasty, Charles Peter Ulric, Duke of Holstein-Gottorp, having been adopted as her successor by his aunt the Empress Elizabeth, a daughter of Peter the Great, he mounted the throne as Peter III., and the present Czar (Alexander II.) is his great-grandson.

During the last three centuries the successive dukes and czars of Muscovy and emperors of all the Russias, have followed the same policy of extending their dominions by every possible means, fair or foul. They have now declared themselves the heads and protectors of all the Slavonic races, and of the orthodox Greek Church, and seem to make no secret of their deep-laid project of unscrupulous aggrandizement. Their vast dominion now extends in length through 202° of longitude, and in breadth through 38° of latitude, and is supposed to contain about 65,000,000 of inhabitants, of whom five-sixths are in Europe.

Spain and Portugal. Spain and Portugal, though they be two distinct and separately independent kingdoms, form nevertheless only one geographical region, emphatically called "the Peninsula." The country, above the maritime lowlands, generally consists of high valleys and table-lands, separated by long ranges of rugged mountains, which extend in an easterly and westerly direction, and terminate with promontories in the Atlantic Ocean, while they are connected in the east by their diverging offshoots. The climate and natural productions are consequently very various. The maritime lowlands on the Mediterranean, and the south-western portion of the Atlantic shores, are almost tropical in respect of climate and vegetable productions; but the temperature of the inland regions is cool and mild, and generally dry, though the extremes of summer and winter are excessive. At Madrid, for example, the summer heat is always so great that, according to the Spanish proverb, that city has "nine months of winter and three of hell!" In addition to silk, tobacco, vines, olives, and all the productions of France and Germany, the peninsula produces the orange, citron, sugar-cane, cork-tree, dates, figs, and cotton. Wheat is the grain most generally cultivated; barley and rye are next in quantity; considerable quantities of maize and rice are also raised, but little of oats and potatoes. Wine, brandy, and wool are the principal and most valuable articles of export. Both kingdoms, however, are in a very low estate, in respect of material, commercial, and social well-being. Since 1807 they have been undergoing continual political changes and revolutions, which seem not yet to have reached their consummation, though Portugal is somewhat more settled than Spain. In such circumstances their political importance is almost null, and, in relation to the vast natural resources of the country, the population is very small.

Italy. The Italian peninsula possesses a remarkably well defined boundary, not merely in its long line of sea coasts, but also in the Alps, which separate its northern provinces from France, Switzerland, and Germany; not forming, however, such an impassable frontier as to have saved the country from the invasion and domination of the northern races. In the north, the Alps and the Apennines inclose between them the rich plains of Lombardy, drained by the Po and its numerous tributaries. Further south, the peninsula consists of a long hill country traversed by the Apennines, and bordered by maritime valleys and plains, which are generally more extensive towards the Tuscan than towards the Adriatic Sea. The south-western portions of Tuscany and the Roman State, called the Maremma, are rendered almost uninhabitable in summer by the prevalence of *malaria*. They are likewise marshy, and in consequence left almost uncultivated; they feed nevertheless large herds of beeves and buffaloes. The climate of Italy is humid and not generally salubrious, for while the northern regions are exposed to frequent piercingly-cold blasts from the snow-capped mountains, the southern provinces are oppressed by sultry winds that seem to blow from the African deserts, and are often loaded with an impalpable dust. The natural productions are, however, rich and various. Everything that grows in France and Spain grows at least equally well in Italy, and the people of the northern provinces, especially Lombardy, are sufficiently industrious. The country has long been divided among a number of petty princes, and oppressed by the heavy weight of both spiritual and political despotism. The people, nevertheless, by their talent and industry, have kept their country in a relatively more respectable position than those of the Spanish peninsula; and the example set by the introduction of liberal principles and practices in the states of the King of Sardinia is not likely to remain long without effect on the other states. The people of Italy, however, have never shown such national sympathies as would seem to lead them to coalesce into a great nation, occupying the whole peninsula as one independent country.

Turkey and Greece. The south-eastern peninsula of Europe is occupied by Turkey and Greece, both of which may be described as mountainous countries, including within their ridges numerous fertile valleys, and in some places extensive lowland plains. The climate and productions of the country are generally the same as those of Italy. The two governments that possess it are equally inefficient for good, though the one be that of a great and powerful empire apparently in the last stage of decay, and the other a newly established kingdom. The dominant people of Turkey are the Osmanlee or Ottoman Turks, a branch of the great Toorkee family of Central Asia. There are, however, various other races, some of them more numerous than the Turks, as the Roumi or Greeks, Arnauts or Albanians, Bulgarians, and other Slavonians, Vallachians, Armenians, Jews, Gypsies, and Franks. Greece is now possessed almost exclusively by a people who boast of their descent from the ancient Hellenes, and speak a language not very much altered from the classic form; but they are not the less evidently much mixed with Slavonic and other barbarian blood. Their independence was established in 1827, but as yet it has been unproductive of any good.

EUROTAS, in *Ancient Geography*, a river of Laconia, which rises in the mountains separating that country from Arcadia, and, after traversing through its whole length the great valley formed by Mount Parnon on the east and Taygetus on the west, falls into the Laconian Gulf. Before it received the name of Eurotas it was known as the Bomycas, and afterwards as the Himerus. Its modern name during the upper part of its course is Iris or Niris; from the town of Sparta to the sea it is known as the Vasilipotamo or King-river.

EURYALUS, a celebrated Trojan, son of Opheltes, celebrated in the *Æneid* for his personal gallantry and his friendship for Nisus the son of Hyrtacus.

EURYDICE, the wife of Orpheus. See ORPHEUS.

EURYMEDON, in *Ancient Geography*, a river of Asia Minor, rising in the mountains of Pisidia, and flowing due south through Pamphylia into the Pamphylian Sea. Its modern name in the upper part of its course is Save-Su; in the lower, Capri-Su. Anciently the Eurymedon was navigable; but its mouth is now closed by sand-bars. Historically it was famous as the scene of a celebrated battle, in which Cimon the son of Miltiades, after destroying the Persian fleet at Cyprus, completely routed their land forces, B.C. 470.

EURYSTHEUS, a king of Argos and Mycenæ. See HERCULES.

EUSEBIUS, surnamed PAMPHILI, bishop of Cæsarea, the father of ecclesiastical history, was born about the year 264 A.D., towards the close of the reign of the Emperor Gallienus. Of his youth nothing is known except that he was a most assiduous student, and probably held some inferior office in the Cæsarean church. In the persecution set on foot against the Christians by Diocletian, Pamphilus, the bishop of that church, was imprisoned, and after two years' confinement suffered martyrdom. During the whole of this period he was tended with the most watchful care by Eusebius, who testified his affection for the old bishop among other ways by assuming his name. When all was over, Eusebius fled to Tyre, where he was kindly treated; and afterwards to Egypt, where he was thrown into prison. On procuring his release he returned to his native Cæsarea, of which he was appointed bishop about the year 315. In the year 325 Eusebius attended the Council of Nice, and was appointed to deliver the address to the Emperor Constantine, and then to take his seat on his right hand. He took a leading share in the proceedings of this assembly, as may be inferred from the fact that he drew up the first draught of the Nicene Creed. The position of the Church at the time this council was convoked to deliberate upon it was embarrassed and complicated by the rise and spread of the Arian heresy, which, from certain inconsistent and self-contradictory passages in his previous works, Eusebius was believed to favour. His real views of the relation between the first two persons of the Trinity appear, so far as he has developed them, to coincide pretty much with those of Origen; but he neither went fully into the subject himself nor encouraged its discussion in others, believing it to lie beyond the pale of human cognizance. With this idea, he appeared at the Nicene Council disposed to regard the case of Arius with the utmost tolerance, and not only so, but he even wrote a letter to Alexander of Alexandria, whose object was to vindicate the orthodoxy of Arius from his own writings, or, in the event of the worst, to save him from punishment for maintaining a doctrine to which, in his estimation, far too much importance was attached. Accordingly the draught of the creed which he prepared, and which was sanctioned by a moderate party in the council, was calculated to meet the views both of the Arian section of the assembly and their antagonists, whose most redoubtable champion was Athanasius. Arius accepted the creed as subsequently modified by the majority of the council, with the addition of the word *consubstantial*, on which Athanasius vehemently insisted. Eusebius at first refused to sign the draught of the creed as thus modified; but on the representations of Constantine agreed to do so, explaining, in a circular to his diocese, the grounds on which he did so. The deposition of Arius he strongly opposed, and, contrary to the opinion of Athanasius, used his efforts to have that heretic reinstated in his charge. Nor did he abate his intimacy with the chiefs of the Arian party in the church. One of its chief defenders was his own namesake, the bishop of Nicomedia. The sect which took its name from this prelate, and of which Eusebius Pamphili was a distinguished member, appears to have been actuated more by hostility to Athanasius than a desire to promulgate the tenets of Arius, who had himself submitted to the decrees of the Council of Nicæa. In the Council of Tyre, Eusebius joined in the outcry against Athanasius, who was deposed for alleged disobedience to the emperor, disrespect to the council, &c.; and he even seems to have used his influence with Constantine to secure the banishment of that father. Some of the personal traits in the character of Eusebius are interesting. He had an intense hatred of the pictures and images of Christ, the use of which were then beginning to creep into the church; and on one occasion, when requested by the sister of Constantine to send her one of the pictures in question, he not only refused, but denounced in the strongest language the use of such adjuncts of worship, as savouring of heathenism. Another point on which he held equally strong opinions was the impropriety of transferring ecclesiastical officers from one sphere of labour to another, and exemplified the sincerity of his convictions on this point by refusing the see of Antioch, which he was repeatedly pressed to exchange for his own. His modesty was duly appreciated by his imperial patron, who declared Eusebius worthy to be bishop of the whole world. Eusebius died about the year 340, at the age of seventy-six. Apart from the many strictures which subsequent writers have passed upon the orthodoxy of Eusebius, his fidelity as an historian has been impugned by Gibbon, who describes Eusebius himself as a mean sycophant, living on the breath of his imperial patron. The charge of sycophancy is one to which Eusebius is obnoxious in common with nearly the whole Christian world of that time. Under Constantine the Christians were not only secured against the persecutions to which they had hitherto been exposed, but had the satisfaction of seeing their religion established as that of the state. It is no wonder, then, that they should have been rather extravagant in demonstrating their gratitude for so remarkable a change, and ascribing to Constantine praises which were not the right of any mortal. The graver charge of historical infidelity is one which has been alleged against Eusebius by Gibbon alone, and is based only on a confession of the historian himself, that in his account of the early Christian church he suppressed allusion to the strifes and dissensions which occasionally broke out; believing the narration of such incidents less edifying than the stories of the martyrs whose lives and deaths were alike honourable to themselves and the religion they professed. From his avowed adoption of this principle, his history may be defective, but it is not therefore necessarily dishonest.

Of Eusebius' works the most important are the following:—

1. The *Ecclesiastical History*, in ten books; comprising the history of the church from the ascension of Christ to the defeat and death of Licinius, A.D. 324. 2. The *Chronicon*, in two books; comprising a historical sketch, with chronological tables, of the most important events in the history of the world from the days of Abraham till the twentieth year of the reign of Constantine. This work, which is one of great importance in the study of ancient history, was published in its complete form for the first time by Mai and Zohrab at Milan in 1818. 3. The *Præparatio Evangelica*, in fifteen books; a collection of facts and quotations from the works of nearly all the philosophers of antiquity, intended to prepare the reader's mind for the acceptance of the Christian evidences. 4. The *Demonstratio Evangelica*, a learned and valuable treatise on the evidences them-

selves. 5. An essay *Against Hierocles*, at whose instigation Diocletian had persecuted the Christians. 6. *De Martyribus Palestinæ*, a history of the persecutions under Diocletian and Maximin from 303 to 310. 7. *Against Marcellus*, bishop of Ancyra, who had been condemned for Sabellianism. 8. *De Ecclesiastica Theologia*, a continuation of the last-mentioned essay. 9. *De Vita Constantini*, a panegyric on that emperor. 10. *Onomasticon de locis Hebraicis*, a treatise on the geography of the Bible.

(Cave, *Script. Eccl. Hist. Lit.*; Fabric. *Bib. Græc.*; Neander; Waddington's *History of the Church*; Smith's *Dictionary of Gr. and Rom. Ant.*; *Biogr. Univers.*, &c. &c.)

EUSTACHIUS (in Italian Bartolomeo Eustachi), one of the most celebrated anatomists of the sixteenth century, of whose history almost nothing is known except that he died at Rome in 1570. His name is preserved in that of the Eustachian tube, which runs between the inner ear and the upper part of the throat; and the Eustachian valve of the heart. See Anatomy, vol. iii., p. 46.

EUSTATHIUS, bishop of Berœa, was a native of Side in Pamphylia. By the council of Nice, in which he distinguished himself by his zeal against the Arians, he was promoted to the patriarchate of Antioch. So violent was the feeling among the Arians against him, that a synod of Arian prelates convened at Antioch brought about his deposition and banishment through a series of heavy charges founded on evidence which they themselves knew to be false. This villany was not discovered till a woman, whose evidence had told very heavily against Eustathius, confessed on her deathbed her own perjury, and that of the other witnesses, who had been suborned. Her confession came too late to benefit the deposed bishop, who had died at Trajanopolis in Thrace, A.D. 329 or 330. Of several works attributed to Eustathius there is only one which can with certainty be pronounced his—an address, namely, to the Emperor Constantine, during the sitting of the council of Nice.

Eustathius, archbishop of Thessalonica, was a native of Constantinople, and flourished during the latter half of the twelfth century. Such of his works as have descended to our times display a comprehensiveness and variety of erudition that fairly entitle him to the praise of being the most learned man of his day. The most important of these is his *Commentary on the Iliad and Odyssey of Homer*, a work valuable as comprising large extracts from the scholiæ of other critics whose works have now perished, such as Apion, Heliodorus, Aristarchus, Aristophanes of Byzantium, &c. This commentary was first published at Rome, 1542–50, in 4 vols., and was reprinted at Leipzig in 1825–29, under the editorial care of G. Stalbaum. Eustathius also wrote a Commentary on Dionysius the Geographer, first printed by Robert Stephens in 1547, and frequently reprinted since. A Commentary on Pindar, which he is known to have written, has been lost. Eustathius died in 1198. The funeral orations pronounced in his honour by Euthynius and Michael Choniates are still in MS. in the Bodleian Library.

Eustathius, a famous Græco-Roman jurist, who flourished at Constantinople in the latter half of the tenth century, and filled various high offices under the emperors who reigned during that period. He is frequently mentioned under the names of Patricius, Magister, and Romanus. Besides his *Romaïca*, frequently quoted by later jurists, Eustathius wrote a number of other works never published, the MSS. of which are still extant in the Vatican at Rome, in Paris, and elsewhere.

EUSTATIUS, St, one of the Leeward Islands, in the West Indies, between Saba and St Christopher's, 15 miles from the former, and 8 from the latter. N. Lat. 17. 31.; W. Long. 63. 3. It is a high rock, rising from the waves in the form of a pyramid, and is 29 miles in circumference. The climate is healthy, and the soil, which is cultivated to the very summit, most prolific. Like other islands in this region of the globe, St Eustatius is subject to the desolating visitation of thunder-storms and hurricanes. The latter

are most to be dreaded during August and September. There is only one landing-place, which, besides being difficult of access, is strongly fortified; a precaution which has been taken with every assailable point in the island. Besides growing sugar, cotton, maize, and large quantities of tobacco, the inhabitants rear great quantities of the smaller kinds of live-stock, in which they carry on a considerable contraband trade with the neighbouring islands. St Eustatius was settled by the Dutch as early as the beginning of the seventeenth century; but in 1665 it was taken by the British, who in their turn were ejected by the French. In 1781 it yielded to Admiral Rodney, but was again wrested from the English by the French; and, after repeatedly changing masters according to the varying fortunes of war, it was finally transferred to the Dutch government at the peace of 1814. Pop. about 3000.

EUSTYLE. See Glossary to Architecture.

EUTERPE, one of the nine muses, who was supposed to preside over lyric poetry and playing on the flute, the invention of which instrument is ascribed to her. The name is derived from εὖ *well* and τέρπω *I delight;* hence Euterpe signifies the inspirer of pleasure. This goddess is usually represented as a virgin crowned with flowers, and holding a flute; or with various musical instruments lying around her. To Euterpe has also been ascribed the invention of tragedy, which, however, is more usually attributed to her sister Melpomene.

EUTIN, the capital of the principality of Lubeck, grand duchy of Oldenburg, 20 miles N.N.W. of the town of Lubeck. It is pleasantly situated on a lake of the same name, in a detached territory surrounded by Holstein; and has a handsome ducal palace and park, and about 3000 inhabitants.

EUTROPIUS, a Roman historian, whose surname is conjectured by Sigonius, though on no reasonable grounds, to have been Flavius. So little has been ascertained concerning his personal history, that it is not even known to what country he belonged. He held the office of secretary (*epistolaris*) under Constantine the Great, accompanied Julian in his unfortunate expedition against the Parthians, and survived to the reign of Valens, to whom he dedicated his history. This work, published under the title of *Breviarium Historiæ Romanæ*, is a compend of Roman history from the foundation of the city to the accession of Valens. This treatise has been compiled with considerable care from the best accessible authorities, but every incident discreditable to the Roman name has been either wholly omitted or quietly glossed over. Modern criticism, too, has not failed to discover occasional mistakes both in matters of fact and in the chronology; and though the style is clear, simple, and precise, and evidently framed with great care on the models of the Augustan age, yet sometimes words are used belonging rather to the silver than the golden age of Latin literature. From its brevity and clearness, Eutropius' history was for a long time a favourite elementary school book; and it is not yet wholly superseded. As a history its value is not great, but it is sometimes serviceable in supplying the lacunæ occurring in history from the total loss of some of the classics, and the imperfect state in which others have come down to us. There have been many editions of Eutropius. That by Havercamp was reputed the best till the appearance of the more complete and critical ones by Tzschucke, Leipz. 1798, and Grosse, Halle, 1813. Of the two Greek translations of Eutropius, that by Capito Lycius has long since perished; the more recent version ot Pæanius will be found incorporated with the best editions of the Latin text.

EUTYCHES, the founder of the heretical sect of the Eutychians, was a presbyter and abbot at Constantinople, and first came into notice at the time of the Nestorian controversy. Nestorius (though he disavowed the charge) was

accused of teaching "that the divine nature was not incarnated in, but only attendant on, Jesus; being superadded to his human nature after the latter was completely formed." Eutyches, in the zeal of his opposition to this doctrine, went to the opposite extreme, declaring that in Christ there was only one nature, that of the incarnate Word, and that his human had been absorbed by his divine nature. A council, convened at Constantinople in 448 (the year in which this heresy was broached) condemned Eutyches, who appealed to a general council called in 449 by the Emperor Theodosius at Ephesus. The scenes of shameful violence with which this council was disgraced gained for it the title of "the synod of robbers." Eutyches was acquitted; his opponents sought safety in flight; and Flavianus, bishop of Constantinople, was scourged by the soldiers who had been stationed in the hall to keep order. On the death of Theodosius, his successor, Marcian, convoked a council at Chalcedon (the fourth œcumenical council of the Latin Church), which annulled the proceedings of the Ephesian assembly, condemned the heresy of Eutyches, and degraded him from the priestly office. Eutyches is believed to have died in exile. The Eutychian heresy was kept alive and fostered by Eudocia, the widow of Theodosius, and sometimes broke out in scenes of violence that required to be checked by an armed force. Under the title of Monophysites the disciples of Eutyches continued to propagate their doctrines, though with no remarkable success, till the sixth century, when Jacob Baradæus (who died bishop of Edessa in 588) gave a powerful impetus to their extension. Under the name of Jacobites the Eutychians constitute at this moment a very numerous church, whose principal adherents lie among the Copts and Armenians. See MONOPHYSITES and MONOTHELITES.

EUXINE, the English form of the Latin Euxinus, the classical name of the Black Sea. The original designation of the sea was *Axenus* or Inhospitable, from the fierceness of the storms with which it was believed to be periodically visited, and also from the ferocity of the nations which dwelt around its shores. By the later Greeks its name was changed into *Euxinus* or Hospitable, as being a word of better omen.

EVAGRIUS, surnamed SCHOLASTICUS and EX-PREFECTUS, was born at Epiphania in Syria, A.D. 536. From his surname he is known to have been an advocate, and it is supposed that he practised at Antioch. He was the legal adviser of Gregory, patriarch of that city; and through this connection he was brought under the notice of the Emperor Tiberius, who honoured him with the rank of quæstorian. His influence and reputation was so considerable that, on the occasion of his second marriage, a public festival was celebrated in his honour, which, however, was interrupted by a terrible earthquake, said to have destroyed 60,000 persons. Evagrius' name has been preserved by his Ecclesiastical History, extending over the period from the third general council (that of Ephesus, A.D. 431) to the year 594. Though not wholly trustworthy, this work is tolerably impartial, and appears to have been compiled from original documents, though it is disfigured by the unquestioning credulity characteristic of the age. The best edition is that contained in Reading's *Greek Ecclesiastical Historians*, Cambridge, 1720. It is also translated in Bagster's work bearing the same title.

EVANDER, in *Greek and Roman Mythology*, a son of Mercury and an Arcadian nymph called in the Greek traditions Themis or Nicostrate, and in the Roman Tiburtis, or more commonly Carmente. In consequence of civil broils, in the course of which Evander was worsted, he left his native city of Pallantium in Arcadia, and sailed for Italy, where he settled at the foot of the Palatine Hill, and was hospitably received by king Turnus. The town of Pallantium, which he is said to have built on the spot where he disembarked, was subsequently incorporated with Rome, and gave name to the Palatine Hill, Palatium, &c. Among the other arts which traditions describe him as diffusing among the Italians, was that of writing, which he had himself learned from Hercules. Virgil describes Evander as still alive when Æneas landed in Italy, and as forming an alliance with that chief against the Rutuli.

EVANGELISTS (from εὐ *well*, and αγγελος *messenger*, or messenger of good tidings). This term is applied in the New Testament to a certain class of Christian teachers who were not fixed to any particular spot, but travelled either independently, or under the direction of the Apostles, for the purpose of propagating the gospel. In the Epistle to the Ephesians (iv. 11) the *Evangelists* are expressly distinguished from the pastors and teachers, who were persons stationed at particular places to confirm and instruct the converts statedly and permanently. Such is the representation given by Eusebius (*Hist. Eccles.*, iii. 37). Referring to the state of the church in the time of Trajan, he says, "Many of the disciples of that time, whose souls the Divine word had inspired with an ardent love of philosophy, first fulfilled our Saviour's precept by distributing their substance among the poor. Then travelling abroad they performed the work of evangelists, being ambitious to preach Christ, and deliver the scripture of the Divine Gospels. Having laid the foundations of the faith in foreign nations, they appointed other pastors, to whom they entrusted the cultivation of the parts they had recently occupied, while they proceeded to other countries and nations." The term evangelist is also applied in a more limited sense to the authors of the canonical Gospels.

EVAPORATION is that process by which liquids and solids gradually assume the gaseous form, or by which, in certain circumstances, an invisible vapour or gas is continually detached from the surface of water, and perhaps of every other liquid, as also from the surfaces of many, if not every solid. From this process being generally found to lower the temperature of the evaporating body, an effect which might have been expected from the doctrine of latent heat, it is probable that heat enters largely into the constitution of every vapour, and is therefore supposed to be the principal agent. At a given temperature, a cubic foot or other determinate space incumbent over a liquid, cannot contain above a certain quantity of the same kind of vapour; and when it contains that maximum, it is said to be saturated. If, therefore, after this is the case, any additional vapour continue to be thrown off, it must either fall back immediately into the liquid, or, if slightly cooled, may apparently remain suspended in the visible form of a cloud, which, however, is not properly vapour, but minute drops, formed by the cooling of it, and which successively fall back into the liquid. For evaporation continues to go on under the pressure of air or other gas however dense; but ceases in the presence of any gas, however rare, if already saturated with the same vapour, unless such gas be colder than the evaporating body; in which case, however, the vapour being partly condensed into drops, becomes cloudy, as was just mentioned; and sometimes liquids, while in the act of ebullition, which is rather an extreme case of evaporation, throw up small drops, which may be seen alternately rising and falling in the vapour. Such is a summary of a few of the leading facts, several of which we shall have occasion to touch on more fully, along with other particulars, whilst briefly noticing, as we shall now do, some steps in the history of this inquiry, before proceeding farther.

Historical sketch of various theories of evaporation.

The spontaneous disappearance of water, and the drying of humid bodies, or the tendency which moisture has to escape from them and diffuse itself in the atmosphere, and afterwards to descend as rain, snow, dew, &c., must have been familiar to mankind in every age, condition, or climate; but anything like an approach to a rational expla-

Evaporation.

nation of the facts seems to be of very modern date. Some of the ancients, particularly Aristotle, conjectured that fire was concerned in the process; but such of their notions as have come down to us are so little to the purpose, that they need not now be dwelt upon. Halley supposed that aqueous vapour consisted of small hollow spherules, filled with something so very light, that they readily ascended and floated in the air,—a theory not altogether such as might have been expected from the known sagacity of its author; for, though Descartes seems to have hinted at the same thing long before, it scarcely appears to have had the least shade of truth in it. But so completely was Kratzenstein's imagination filled with this doctrine, that he fancied he could see these vesicles with a microscope, and even discern them to be hollow, notwithstanding their being supposed to form a transparent vapour. If he really saw any thing, it was more probably minute drops of water descending in the air. Nay, almost up to the close of the last century, we find many eminent men, and among these the late able mathematician Mr George Atwood, maintaining and speculating on this vesicular theory, as it was called. Halley, it is true, hinted at another theory, which not a few embraced, and for which some have still a predilection, namely, that air holds moisture united to it by chemical solution or affinity; but the first idea of this seems to be due to Hooke. A different explanation was attempted by Desaguliers, who, after pointing out the defects of former theories, showed that water is capable of being converted into a transparent elastic fluid, which he supposed to be many times lighter than air, and that it could therefore ascend and float in the atmosphere; but he some time afterwards inclined to ascribe the ascent of vapour to an electrical attraction of the air. Desaguliers was no doubt greatly mistaken regarding the specific gravity of steam, which, under the same pressure and temperature, is now known only to fall short of that of air in the ratio of five to eight; but he was perhaps the first who thought of identifying pure steam with the attenuated aqueous vapour diffused in the atmosphere. It would seem that prior to Desaguliers advancing this notion, it was not known that steam is always generated in a transparent state, although minute drops of water may be passing or falling through it; and indeed some are scarcely aware of this at the present day. The fact is, that steam or aqueous vapour preserves its transparency so long as it has neither lost heat nor had its volume enlarged; but so soon as its temperature is lowered, whether from losing heat or from enlargement of volume, it is more or less condensed into minute drops of water, which of course render it opaque. For we can on no account admit the very generally received doctrine of M. Clement, that equal weights of steam, if in contact with water, contain equal quantities of heat, whatever be their volumes or temperatures. On the contrary, we cannot help believing that a given weight of steam requires more heat to maintain it in the transparent elastic form, when under a greater volume, than under a less; and in proof of this, we presume it is only necessary to adduce the following fact. If we open a stop-cock in the cover of a boiler when the pressure is only one atmosphere, the steam which issues preserves its transparency till it get to some distance from the orifice; but when the pressure within amounts to two or three atmospheres, the steam, if allowed to issue freely, is opaque from the very orifice. This clearly shows that the same quantity of heat (we do not mean temperature) which had been amply sufficient to maintain the steam in the transparent form under a smaller volume within the boiler, is quite inadequate to do so when the steam is allowed to enlarge its volume under a reduced pressure. A more palpable or satisfactory proof than this, which has been long before the public, is scarcely to be wished; yet we find Dr Lardner subsequently reading a paper to the Royal Society on the heat of steam, and which has for its foundation the untenable theory of Clement. Indeed M. Clement's mode of experimenting was so fallacious, that it would have given him the same results whether his theory had been true or not. For when the stream of steam is very small, and of course passes through the stop-cock with difficulty, as it must have done in his experiments, it has, while in the act of dilating from under a force of two or three to that of one atmosphere, the opportunity of absorbing heat from the metal of the scarcely open stop-cock, then much hotter than 212°, the temperature to which the dilating is supposed to reduce the steam. No wonder then that equal weights of steam, at first so different in density, should, when received in equal quantities of cold water, produce equal rises of temperature; as is pointed out more particularly in the *Philosophical Magazine* for July 1826, p. 38. It is likewise to be remembered, that though in the other experiment the steam must have been absorbing some little heat from the stop-cock, this did not enable it to preserve the transparent form. We have been the more particular in clearing up this point, because we shall shortly have occasion to refer to it.

Desaguliers's theory.

Doubts regarding Clement's theory of the latent heat in vapour.

From the time of Halley and Desaguliers to about 1770, a variety of essays on evaporation made their appearance, which, however, tended but little towards elucidating the subject, because they were either not founded on experiments at all, or on such as were not sufficiently elementary. Some of these sought to establish the vesicular system, while others advocated that of chemical solution and electrical attraction. At length, in 1783, came forth the well known *Essais sur l'Hygrométrie* of M. de Saussure, who, though he did not labour so much to establish new theories as to blend together or combine some of those already mentioned, certainly added considerably to the stock of facts. But he at the same time greatly indulged his fancy in supposing aqueous vapour to be capable of existing in four different forms. When it alone occupied a space, he called it *pure elastic vapour*; when diffused in a transparent state in the air, he named it *dissolved elastic vapour*, imagining it to be chemically dissolved by the air; but after the air was quite saturated with this sort, he thought some of it assumed the form of *vesicular vapour*, only differing from that of Halley in being visible. To these he added *concrete vapour*, which consisted of liquid drops, such as form clouds and fogs; a real form of moisture to be sure, but one which is not properly vapour at all. In these *Essais* we have an account of a variety of experiments, most of them having the advantage of being executed on a great scale; but, on the other hand, they were often deficient in that elementary simplicity which is so important in a research of this nature, if we would avoid sources of fallacy. By inclosing a known weight of caustic alkali in a very large glass balloon, previously filled with thoroughly damp air, Saussure endeavoured to find what quantity of moisture this air contained, from the increase of weight which it communicated to the alkali; and conversely, by weighing a bit of wet linen, and suspending it in the balloon filled with dry air, he estimated how much moisture had evaporated from the linen to render the air thoroughly damp. These two methods not only gave him nearly the same result, but did so whether he used pure hydrogen or carbonic acid in the balloon, and even when he employed a mixture of these gases. During these experiments he also observed, by means of a gauge, what change of pressure took place within the balloon from the change of humidity.

Researches of Saussure.

By operating at different temperatures, he obtained re-

sults from which different conclusions might be drawn to suit different theories; for instance, that the quantity of vapour which could exist in the balloon varied in geometrical progression for equal intervals of temperature, and nearly as the square root of the air's density; and that air of the ordinary density could contain five times as much vapour as a vacuum did; all of which conclusions are now known to be incorrect. Prior to this, Lambert had, from his experiments, drawn a very different but still more erroneous conclusion, that the quantity of moisture varied as the *square* of the air's density.

Theory of Deluc and Dalton.

It was natural to think that the great discordance between the results of these celebrated philosophers should have raised doubts whether they might not both have deceived themselves by too complex a mode of operating, and, therefore, that neither of them was likely to be correct. Accordingly we find M. Deluc, in his *Idées sur la Météorologie*, hinting at an incomparably more simple theory, which he afterwards developed more fully in the *Philosophical Transactions* for 1792, viz. that the quantity of vapour which can exist in a given space depends upon the temperature alone, and is independent of the presence or density of air, or of any other elastic fluid with which the vapour forms no chemical combination, being the same as if nothing but the vapour occupied that space. In this speculation he also maintained, as Desaguliers had done, that pure steam and the attenuated aqueous vapour diffused in the air are the same. Something similar to this theory was advanced by M. Pictet in his *Essai sur le Feu*, and still more so by Dr Dalton in his *Meteorological Essays*; and it is not improbable that each might have hit upon the same theory before knowing what the others had done. By inclosing his hygrometer along with a little water under a receiver, Deluc found that the indications of that instrument were the same whatever was the density of the included air, or however much he exhausted it; and the same thing held true with other gases. Volta, likewise, from a great variety of experiments, was led to acquiesce in the theory of Deluc.

Dr Dalton's researches.

The theory was farther investigated, in a much more elementary way, by Dr Dalton, as detailed in the *Manchester Memoirs*, vol. v.; but preparatory to noticing it, we shall subjoin his manner of expressing himself on the subject in his *Essays*, p. 201, where, from certain experiments and observations, he infers "that the vapour of water, and probably of most other liquids, exists at all temperatures in the atmosphere, and is capable of bearing any known degree of cold without a total condensation, and that the vapour so existing is one and the same thing as *steam* or vapour of 212° or upwards. The idea, therefore, that vapour cannot exist in the open atmosphere at a lower temperature than 212°, unless chemically combined therewith, I consider as erroneous; it has taken its rise from a supposition that *air* pressing upon vapour condenses the vapour equally with *vapour* pressing upon vapour; a supposition we have no right to assume, and which, I apprehend, will plainly appear to be contradictory to reason and unwarranted by facts; for when a particle of vapour exists between two particles of air, let their equal and opposite pressures upon it be what they may, they cannot bring it nearer to another particle of vapour, without which no condensation can take place, all other circumstances being the same; and it has never been proved that the vapour in a receiver from which the air has been exhausted is precipitated upon the admission of perfectly dry air. Hence, then, we conclude, till the contrary can be proved, that the condensation of vapour exposed to the common air does not in any manner depend upon the pressure of the air." The method which Dr Dalton took to clear up this question is distinguished by an elegant simplicity. In the *first* place, he determined by experiment the expansive force of dry air for each degree of temperature between 32° and 212°; and was the first who did so with any thing like accuracy. He at same time found that 1000 cubic inches of air at 32° expanded to 1376 on being heated to 212°, which comes surprisingly near 1375, the result published by M. Gay Lussac shortly after. But through some inadvertency Dr Lardner (on Heat, p. 57) makes Dr Dalton's result 1325, and then gravely adds, that "the latter (Gay Lussac's) determination has been proved by subsequent experiments to be the more correct." *Secondly*, Dr Dalton ascertained the force of pure steam in contact with water for each degree throughout the same range; and, *thirdly*, he found at what rate dry air expanded, when put in contact with water, and then heated through the various degrees of that range. The result was, that at any particular temperature, the expansive force of dry air in the first case, added to the force of vapour in the second, was exactly equal to their joint expansive force in the third. From this it is obvious that there is either no chemical combination between the air and vapour, or that such combination, if it exist, is quite inert, or goes for nothing so far as this research is concerned. Dr Dalton found, that when other gases were substituted for air, the vapour gave the same results; and similar results were obtained when other vapours were treated as steam.

Researches of M. Desormes, &c.

M. Desormes, likewise, by operating in a manner very different from that of Dr Dalton, found the quantity of vapour to be independent of the presence of air or other gases. The question was also examined experimentally by M. Gay Lussac, with his well-known accuracy and ability, and his results precisely agreed with those of Dr Dalton. Still more recently Professor Daniell has made a great variety of interesting experiments on mixtures of gases and vapours, in a manner similar to that employed by Deluc, but with the help of an incomparably better hygrometer; and his researches, too, corroborate the theory completely.

Several objections have been made to this theory; but all of them with which we are acquainted are so nugatory and irrelevant that we do not think they require any refutation. There is, however, a point which the foes as well as the friends of the theory have taken for granted, and which, though extremely probable, it would, for any thing we can see, be very difficult to prove in a direct and unexceptionable manner; viz. that the expenditure of heat in forming a given weight of vapour is the same, whether the process take place in air or other gas, or in a vacuum. Since in most combinations heat is given out, it is a wonder that those who contend for the solution of vapours in gases have not founded some objection on this; for we presume it is the only point on which a doubt could be palmed respecting the theory. It is generally taken for granted too, that the expenditure of heat in forming a given weight of vapour is the same at every temperature; but this assumption we cannot help regarding as very erroneous, because to us it appears quite clear that the expense of heat is greater when the vapour is rarer; and this we maintain for the following reason.

Doubts regarding the expenditure of heat being always the same.

The density of steam at 212°, for instance, is about 109 times greater than at 32° Fahrenheit; and we have already seen that steam loses in a considerable degree the elastic form by being dilated to two or three times its bulk; how much more then if dilated 109 times? Hence steam rarefied to such a degree would need a large addition of heat to enable it to maintain the gaseous form; in other words, much more heat must be expended or become latent in forming a given weight of vapour at 32° than at 212°. If steam, when kept separate from water, have its temperature raised by compression at the same rate as air has, it might be shown that the expense of heat in forming vapour at 32° would be to that at 212° as thirteen to eight nearly, that is, in the

Evaporation.

ratio of the logarithms of the number of times the steam is rarer than water. See *Philosophical Magazine* for April 1832, page 246.

Experiments on force of vapour at different temperatures.

Vapours and gases agree in so many of their properties, that there seems no doubt of their being but one and the same form of matter. Thus, so far as has been examined, every vapour, when kept separate from any sensibly evaporating liquid, expands by heat at the same rate as air and other gases do; and, like gases too, it observes the law of Boyle, by having the force at a given temperature proportional to the density. But since the density of a vapour in contact with its generating liquid increases with the temperature, its force, when so situated, increases much more rapidly than that of air or a mere gas does. However, the precise law which connects the temperature with the density or force seems to be as yet unknown.

Dr Dalton's experiments.

Dr Dalton having, as already mentioned, ascertained by experiment the force of aqueous vapour between the temperatures of 32° and 212°, deduced from the results what he considered to be the relation between the force and temperature, and for some time it was supposed that by means of it the force could be had for temperatures beyond both limits of that range. Accordingly on this principle he constructed a table which extended from —40°F. up to 325°; and indeed he was pretty fortunate in the extension below 32°, because the half of it has since been so nearly confirmed by the very accurate experiments of M. Gay Lussac, which were carried down almost to — 20° *cent.* or — 4°F.; but above 212° the supposed law was soon found to give the force too small, and the more so as the temperature is higher. Yet Dr Lardner, in his separate treatise on heat, gives this part of the table expressly as the result of Dalton's "accurate experiments," and not as it really was, a mere extension by means of a formula; nor does he warn us of its erring almost two atmospheres at the upper extremity. It is likewise curious that Dr Lardner, while he notices performances of far less merit, is totally silent respecting the labours of the Committee of the Royal Academy of Sciences at Paris in 1829; though they executed by far the most extensive and accurate experiments that ever were made on steam at high temperatures, as will be found detailed in the *Annales de Chimie* for January 1830. All the English abstracts from this which we have seen are very incorrect. Dr Dalton has more recently published another table of the force of vapour adapted to some of his theoretical views; but from its differing considerably from the results of others, especially those of Gay Lussac, we do not consider it so correct for low temperatures as his first one, part of which is given farther on in this article.

Guy Lussac's experiments.

The method employed by M. Gay Lussac to determine experimentally the force of vapour at low temperatures is particularly commendable; and yet its merits seem to have been very much overlooked, even by those who were engaged in similar researches. It may therefore be useful to give a brief account of it here. Other philosophers had either not carried their experiments below 32° at all, or had mismanaged the matter by allowing water to freeze in the tube in such a manner as to obstruct the free motion of the mercury, and likewise to render its altitude ill defined and difficult to be seen. These inconveniences were dexterously avoided by Gay Lussac, who still employed a barometer tube, but one so much longer than ordinary that a considerable part of it next the sealed end was above the mercury, and a portion of this, being bent to about an angle of 60°, was immersed in a cold mixture along with a thermometer. The consequence of this arrangement was, that neither the mercury nor the small portion of water on its top necessarily required to be cooled down at all; because, however moderate their temperature might be, the force of every portion of the included vapour being in equilibrio with the force of that which touched the coldest part of the tube, was just the same as if the whole vapour had been at the temperature of the freezing mixture. A farther advantage was, that after the apparatus had been allowed to remain for a short time in the state now described, the water entirely disappeared from the top of the mercury, having been transferred by evaporation or distillation to the sealed end of the tube, where it was quickly frozen. By this means the mercury became almost as free from moisture as if none had been in the tube. It is, besides, evident that this method could be carried down, not only to and below the freezing point of mercury, but to any temperature, however low, to which the extremity of the tube could be cooled; and that it is applicable to every sort of vapour which does not act upon mercury. In fine, Gay Lussac having placed a barometer tube filled with dry mercury beside and in the same cistern with the one which contained both mercury and moisture, read off the difference in the heights of their mercurial columns with great precision, by means of a microscope which could be shifted up and down a graduated pillar, and the difference was obviously the force of the vapour. Although mercury evaporates at all temperatures, as appears from a bit of gold-leaf becoming white if long suspended over it in a phial, and from the noxious effects of breathing air which has been for some time in contact with a large surface of mercury, yet the force of its vapour is so very small compared with that of steam, that it could not sensibly affect these experiments. Indeed it seems to be a general law, that the forces of vapours from liquids which have high boiling points, are quite inappreciable at low temperatures.

Researches on the rate of evaporation.

The most important problem connected with the evaporation of water is to determine the rate at which, under certain circumstances, it escapes from a given surface at a particular temperature. Many cases of this problem are still very imperfectly solved.

Dr Halley's experiments.

The experiments of Dr Halley, detailed in No. 189 of the *Philosophical Transactions*, seem to be among the earliest which were employed for this purpose. He found that water salted to the state of sea water, and exposed to a heat equal to that of a summer's day, did, from a circular surface of eight inches diameter, evaporate at the rate of six ounces in twenty-four hours. Hence he concludes, that a square degree of sixty-nine miles will evaporate 33,000,000 tuns in a day; and supposing the Mediterranean to contain 160 square degrees, it would evaporate 5,280,000,000 tuns daily. This quantity he considers sufficient to supply all the rains, springs, dews, rivers, &c. It would however be of little use to rehearse the whole of this speculation, because the data, as we shall afterwards see, were too loose, and the experiment was on too small a scale, for such a comparison.

Water carried in by the current at Gibraltar cannot be all spent by evaporation.

Dr Lardner, in touching on this subject in his treatise on heat, says, that in the Straits of Gibraltar, instead of an outward current, there is a rapid and never-ceasing inward flow of water, and that he is therefore compelled to conclude that the evaporation from the surface of this sea carries off the enormous quantity of water supplied from this and other sources. Such doctrine from so respectable a quarter rather surprises us; since it is quite well known that, besides the inward current, which is principally in the middle of the surface, there are generally outward currents, likewise at the surface, next the coasts, particularly the south one, and most probably also in the immense deep beneath. It has been alleged, but erroneously, that the water sometimes flows outwards even in mid-channel on the surface. Had there been no outward current, the Mediterranean must long ago have become as salt as the brine of the Dead Sea; or rather perhaps have become a rock of salt, as Dr Thomas Young remarked; for, as we shall afterwards see, no common salt or other muriate rises from the sea by evaporation. In

order that the same degree of saltness may continue, the outward currents must just bear away as much salt as the inward current and other sources supply, with the very slight exception of what the wind carries off in the form of spray, water spouts, &c. The waters of the Mediterranean being, as is well known, specifically heavier, especially at a great depth, than those of the Atlantic, will naturally incline to buoy them up, and flow out beneath them in the infathomable depth of the Straits.

Dr Dobson's experiments.

A series of experiments on the evaporation of water at natural temperatures was continued for four years, beginning with 1772, by Dr Dobson, at Liverpool, as detailed in the *Philosophical Transactions*, vol. lxvii. He took a cylindrical vessel twelve inches in diameter, and having nearly filled it with water, exposed it beside his rain-gauge of the same aperture; and by adding or withdrawing water, as occasion required, he kept the surface at nearly the same height. By comparing the total quantities thus added or taken away with the proceeds of the rain-gauge, the amount of evaporation was ascertained. The mean monthly evaporation for the four years was, in January, 1·5 inches; February, 1·77; March, 2·64; April, 3·3; May, 4·34; June, 4·41; July, 5·11; August, 5·01; September, 3·18; October, 2·51; November, 1·51; December, 1·49. In all, 36·78 inches. The mean rain for the same time was 37·48. For a great deal more in this way, and on the evaporation of ice and snow, see Howard's excellent treatise on *The Climate of London.* That ice and snow evaporate, appears from their losing weight, or even disappearing altogether, if long enough exposed to a brisk and dry wind during frost. But sometimes snow is rendered so much colder by radiation than the incumbent still air, that it condenses the vapour of that air into hoar-frost, and by that means augments its own weight or bulk.

Experiments of Dr Dalton and Mr Hoyle.

But the experiments of Dr Dalton and Mr Hoyle, though rather of local application, were no doubt far more accurate for evaporation from the soil. Having got a cylindrical vessel three feet deep and ten inches in diameter, two pipes were joined to it, and turned downwards for the surplus rain-water to run off into bottles; the one pipe being near the bottom, the other an inch from the top. The vessel was filled up for a few inches with gravel and sand, and the remainder with good fresh soil. It was then put into a hole in the ground, and the space around filled up with earth, except on one side, for the convenience of afterwards joining bottles to the pipes, and registering their contents. The earth in the vessel was now saturated with moisture, by pouring in water till some of it escaped from the pipes; and, lastly, the bottles were put to. During the first year the soil was bare at top; but for the next two years it was covered with grass, like any green field. A regular register was kept of the rain-water which ran off through the upper pipe, and also of what sunk down through the earth to the lower pipe. A rain-gauge of the same diameter was kept close by, to register the quantity of rain for any corresponding time.

Rain	30·629	38·791	31·259				
Evap	23·725	27·857	23·862				

From these experiments it appears, 1*st*, That the mean annual quantity of water evaporated in the above circumstances is twenty-five inches of rain, to which if we add five for dew, will give thirty inches of water raised annually: 2*dly*, That the evaporation increases nearly, though not exactly, in the same ratio as the rain; thus 1797 gave most rain, and the greatest evaporation, &c.: 3*dly*, That there is little difference between the evaporation from bare earth of sufficient depth, and that from ground covered with grass. It is however to be observed, that the numbers in the last or right hand column belong to the years 1799, 1800, and 1801; and that on account of accidents with the frost, these numbers are partly conjectural for January, February, March, April, and December. The mean annual evaporation during the same three years from ground covered with grass, exclusive of dew, was 23·5 inches, which falls a little short of that for the other three, which was twenty-five.

But there is reason to suspect that a less depth of soil in the vessel would have allowed more water to escape into the bottles, and *vice versa.* It is therefore in some degree a matter of conjecture that this apparatus indicated the true evaporation from the adjacent fields. Lahire having filled a vessel eight feet deep with soil, and sunk it into the earth, left it there for fifteen years. It had an opening at the bottom for the escape of the water, but never a drop came through. The quantity of rain, to be sure, being less at Paris than at Manchester, will so far account for this.

In such an article as this it might be expected that, in conformity with custom, we should state the mean evaporation for all England, and a number of other principal countries. This however we are unable to do, because we are persuaded that to obtain even an approximate estimate would require experiments, such as those of Dr Dalton from the soil, to be made at least within every square mile of surface. The usual estimates being only derived from

Evaporation.

a vessel with water, as will be noticed more particularly afterwards, afford no measure of evaporation from the soil.

Relation between the temperature and rate of evaporation.

The following relation between the temperature and the rate of evaporation from water, was discovered by Dr Dalton. Having, as above mentioned, determined experimentally the force through a considerable range, he was naturally led to examine whether the quantity of water evaporated in a given time bore any proportion to the force of vapour of the same temperature, and was agreeably surprised to find that they corresponded in every part of the range examined. Thus the forces of vapour at 212°, 180°, 164°, 152°, 144°, and 138°, are equal to 30, 15, 10, 7·5, 6, and 5 inches of mercury respectively; and the grains of water evaporated per minute are in the same ratio. This Dr Dalton considers as quite in conformity with the laws of mechanics; for the atmosphere seems by its inertia to obstruct the diffusion of vapour, which would otherwise be almost instantaneous, as in vacuo; but this obstruction, which is greater as the air is more dense, is overcome in proportion to the force of the vapour. Did the obstruction arise from the weight of the atmosphere, it would prevent any vapour from rising at temperatures lower than 212°; but according to Dr Dalton it is caused by the inertiæ of the particles of air, and is similar to that which water meets with in descending among pebbles.

The theory of evaporation was thus far settled so much the more easily, because the force of vapour already in the open air being very small compared with what is produced from water at high temperatures, did not sensibly affect the results; but Dr Dalton found, that if the theory was to be verified by experiments for low temperatures, regard must be had to the force of vapour already in the atmosphere. For instance, if water of 59° were the subject, the force of vapour at that temperature being a sixtieth of the force at 212°, one might expect the quantity of evaporation to be a sixtieth also; but if it should happen, as it sometimes does in summer, that an aqueous atmosphere to that amount does already exist, the evaporation, in place of a sixtieth, would be nothing at all. On the other hand, if the previously existing vapour were the 120th, corresponding to 39° F., then the effective evaporating force would be the 120th of that from boiling water. In short, Dr Dalton found that the evaporating force must in every case be equal to that at the temperature of the water diminished by that already existing in the air. To find the force of the aqueous atmosphere, Dr Dalton revived the method which had been employed by Leroy long before. He used in summer to take a tall glass jar, and fill it with cold spring water, fresh from the well. If dew was immediately formed on the previously dry outside, he poured the water out, let it stand a little to rise in temperature, wiped dry the outside of the jar, and then poured the water in again. The like process is to be repeated till dew cease to be formed, and at that instant the temperature of the water is to be carefully noted, for the purpose of obtaining, from a table like that which shortly follows, the corresponding force of vapour. Such temperature is called the *dew point*, or the *point of deposition*; because the air, if cooled to it, would be in a state of saturation with moisture, and of course ready to deposit dew, especially on any thing in the least colder than itself. This operation should be performed in the open air, or at an open window, because the air within is generally more humid than without. Spring water in this country being generally within a degree or two of 50°, will mostly answer the purpose during the three hottest months; in other seasons an artificial cold mixture may be used. But Leslie's or Daniell's hygrometer would be still more convenient at all seasons.

To observe the evaporation at atmospheric temperatures, Dr Dalton had two light tin vessels; the one six inches diameter and half an inch deep, the other eight inches diameter and three fourths of an inch deep, and both made to be suspended from a balance. Water being put in one of these and weighed, it was placed in an open window or other exposed situation for ten or fifteen minutes, and again weighed to ascertain the loss from evaporation. The temperature of the water was at same time observed, the force of the aqueous atmosphere ascertained as above, and the velocity of the current of air noticed; for with the same evaporating force, a strong wind, by quickly changing the air in contact with the water, will double the effect produced in still air. From a great variety of experiments made during both winter and summer, and when the evaporating force was strong and weak, even in the case of ice, the results were found perfectly conformable with the theory. The same quantity is evaporated with the same evaporating force thus determined as near as can be judged, whatever be the temperature of the air. Thus, if the dew point be 40° while the air is at 60°, the evaporation is the same as if the dew point were at 60° and the air at 72°; for ·524 — ·263, which is the difference of the forces of vapour at 60° and 40°, is nearly equal to ·770 — ·524, the difference of the forces at 72° and 60°; but two such differences could be had exactly equal by using fractions of degrees of temperature, and interpolating between the other numbers.

The following table exhibits the ratios and quantity ot water evaporated at different temperatures, derived from the preceding theory, and confirmed by experiments. The first column is the temperature; the second the force of vapour; the rest give the number of grains evaporated from a surface six inches in diameter, supposing the air to be previously dry. The third column is calculated on the supposition that at the temperature of 212° the evaporation per minute from the said surface is 120 grains; the fourth, that it is 154 grains; the fifth, 189, according to the strength of the wind; for if the air in contact with the water be continually changed, so that the recently moistened portion may be speedily removed and drier air substituted for it, the process will be proportionably expedited. These columns present the extremes and mean of evaporation likely to be noticed when the process goes on in air of the ordinary density. The effects of different densities will be considered afterwards.

212°	30	120	154	189

As an example of the use of the table, let the dew-point be 52°, the temperature of the air 65°, with a moderate breeze, to find the evaporation per minute from a vessel six inches in diameter. The number in the fourth column opposite 52° in the first, is 2·06, and that opposite 65° is 3·16; the difference, 1·1 grain, is the evaporation required. Again, if the evaporation per minute, with a brisk wind, be 1·7 grain, while the air is at 62°; required the weight of the aqueous atmosphere, and the dew-point. In the fifth column the number opposite 62° is 3·52, being the whole evaporating force at that temperature in perfectly dry air, from which 1·7 being deducted, leaves 1·82, which, in the fifth column, is opposite to ·294 inch of mercury in the second, the weight of the column of vapour, and to 43° the temperature or dew-point. That is by using the nearest numbers in the table. Greater exactness may be had by interpolating between them. In this case, for instance, the weight should more correctly be ·290, and the dew-point 42°·6. Such estimates, however, are liable to uncertainty, where any doubt remains respecting the velocity of the wind.

Dr Dalton found that the same theory held with regard to the evaporation of other liquids, and was even more easily verified by experiment in their case than in that of water, on account of the air previously containing little or none of their vapours. In short, the evaporation in their case is similar to that of water in perfectly dry air.

Since vapours, so long as they maintain the gaseous form, expand and contract by change of temperature precisely at the same rate as air does in like circumstances, and since mixtures of air and vapour do the same, it follows, that if at any temperature above the dew-point the pressure of the unconfined air have to that of the vapour in it a certain ratio, it will have the same ratio to it at any other temperature not lower than the dew-point. Hence, because the entire pressure is constant, the force of vapour at the actual temperature of the air is exactly equal its force at the dew-point or temperature at which the air under the original pressure becomes saturated with moisture, and at which all the moisture in it just barely maintains the gaseous form.

Dr Anderson, in giving a table of the weight and force of aqueous vapour *in vacuo* (*Edin. Encyc.* xi. 578), says, it is adapted to a pressure of thirty inches, and that when the barometer differs from thirty, the numbers in the table (none of which denote atmospheres, but grains and inches) must be altered in the same ratio as the pressure. It is difficult to conceive how he could fall into such a palpable mistake. Vapour *in vacuo* being protected from atmospheric pressure, has obviously nothing to do with its changes or amount; and we have already seen that the maximum force and density of vapour in air, as well as *in vacuo*, depend solely on the temperature. Yet Dr Anderson (*ibid.* p. 581) makes the maximum weight of vapour which can exist in a cubic inch of air at a given temperature to be proportional to the barometric pressure, which is remarkable, considering his professed adherence to Dalton's theory. It is farther curious that the doctor, not perceiving that the actual force of vapour in the open air must be exactly equal to its force at the dew-point, gives (on same page) a formula for reducing the one force to the other; and he even takes it for granted that Dr Dalton is in the same error, though the very reverse appears from all his writings, and especially those already quoted.

Influence of the density of air on evaporation.

The rate of evaporation is very different in air of different densities, being greater when the density is less, and *vice versa*. Some experiments on this subject are given by Professor Daniell, in the second and much improved edition of his valuable *Meteorological Essays*, published in 1827, page 493, from which we make the following brief abstract:—Upon the plate of an air pump was placed a flat dish 7·5 inches diameter, containing sulphuric acid, and covered by a receiver which but just passed over it, so that the base of the included air rested everywhere on the acid. In the middle of the dish was a stand supporting a vessel 2·7 inches diameter, and 1·3 deep, which was filled with water to the depth of an inch, and had a delicate thermometer resting on its bottom. The water, having been previously freed from air, was weighed with a very sensible balance, and then exposed to the action of the sulphuric acid. Its temperature was 45°, and the barometer at 30·4 inches. At the end of half an hour it was again weighed, and found to have lost 1·24 grain by evaporation. Having been replaced, and the air rarefied till the gauge stood at 15·2 inches, it was found to have lost in half an

Mr Daniell's experiments.

Evaporation.

hour 2·72 grains, and to have had its temperature reduced to 43°. By repeating the process, continually diminishing the pressure one half, the successive losses from evaporation in intervals of half an hour each, were as follow:—

Pressure.	Temperature. Beginning.	End.	Loss, Grains.
30·4	45°	45°	1·24
15·2	45	43	2·87
7·6	45	43	5·49
3·8	45	43	8·80
1·9	45	41	14·80
·95	45	37	24·16
·47	45	31	39·40

When the exhaustion was pushed to the utmost, which was ·07 inch, the evaporation in the half hour was 87·22 grains. During this last experiment the water was frozen in about 8 minutes, while the thermometer under the ice was at 37°. There must, however, be some inadvertency respecting the loss from evaporation in the second experiment; because in the table it is 2·87, and in the account before it only 2·72, which last, we presume, is the more correct of the two.

Before inferring from these experiments the rate of evaporation under different pressures, Mr Daniell applied to the results a correction for the variation of temperature. Taking the evaporation as proportional to the elasticity of the vapour, he estimated the latter from the mean of the temperatures at the beginning and end of each experiment, and calculated the amount for a fixed temperature. This might have been supposed to give a near approximation, were it not evident from the last experiment, that, owing to the bulb of the thermometer not being close at the evaporating surface, it indicated often too high a temperature; but the following table presents the results computed on that principle for the temperature of 45°; and here again we suspect the second number 2·97, being computed from 2·87, is too great.

Pressure.	Grains.
30·4	1·24
15·2	2·97
7·6	5·68
3·8	9·12
1·9	15·92
·95	29·33
·47	50·74
·07	112·32

Notwithstanding the slight irregularity of the series, Mr Daniell thinks we can run no risk in concluding that the amount of evaporation is, *cæteris paribus*, in exact inverse proportion to the elasticity of the incumbent air. But perhaps it would be more correct to say, that, *cæteris paribus*, the rate of evaporation is inversely as the *density* of the air; for that is Dr Dalton's view of the matter, and is equally conformable to these experiments. It may however be observed, that the rate of evaporation in the first case, which is in air of the ordinary density, is much smaller than that given by Dr Dalton; but the process going on in so small a volume of still and confined air, seems a sufficient reason for this.

Cooling influence of evaporation.

It was hinted above, that evaporation tends to lower the temperature of an evaporating surface, by abstracting heat from it for the formation of vapour. For, from the well known fact, that in the formation of aqueous vapour as much heat is absorbed as would raise the temperature of 1000 times its weight of water one degree, it follows, that were it not for the heat derived from surrounding bodies, the vaporization of the 1000th part of a mass of water would lower the temperature of the whole one degree; so that by the time the 100th part had evaporated, the temperature of the whole would have fallen ten degrees. But surrounding bodies, particularly the air, by participating in the cooling effects, supply heat in such a manner to the water, that a limit is soon set to the fall of temperature. Although this cooling influence has been long known in a general way, it is remarkable how few experiments have been made, or, so far as we know, published, to show the extent of cold produced in different circumstances; and still more remarkable, that those few results of different experimenters should differ so widely, as we shall presently see they do. Dr Anderson, in the article *Hygrometry*, in the *Edinburgh Encyclopædia*, gives the following as the results of his experiments on the cold produced by the evaporation of water in air of different densities. For this purpose he placed Leslie's hygrometer, along with a cup of sulphuric acid, under a receiver of the air pump.

Dr Anderson's experiments.

29·6	48°·5	43°·64	4°·86	27°
23·6	48 ·5	42 ·38	6 ·12	34
17·6	48 ·5	40 ·58	7 ·92	44
11·6	48 ·5	37 ·34	11 ·16	62
5·6	48 ·5	32 ·12	16 ·38	91

The first column is the pressure in inches, the second the Fahrenheit temperature of the dry bulb, the third that of the moist, the fourth their difference or the depression, and the fifth the same depression in degrees of Leslie's hygrometer. The third and fourth columns, though not in the original, are obviously obtained from the others, and inserted in degrees of Fahrenheit, for the sake of comparison with those which follow.

In an article on hygrometers and evaporation, in the *Edinburgh Philosophical Journal* for October 1826, Mr Meikle gives the two following series of similar experiments, which were not made with Leslie's hygrometer, but with what was reckoned preferable for the purpose, two common thermometer tubes fitted upon one broad and doubly graduated scale; the one bulb being dry and the other covered with wet linen. The columns respectively denote the same things as the first four in Dr Anderson's.

Mr Meikle's experiments.

29·7	48°·2	36°·6	11°·6
19·4	47 ·3	33 ·2	14 ·1
17·2	47 ·2	32 ·5	14 ·7
13·3	47 ·0	31 ·2	15 ·8
8·8	46 ·4	27 ·2	19 ·2
29·9	60°·6	45°·5	15°·1
20·0	59 ·5	41 ·0	18 ·5
10·0	58 ·9	34 ·1	24 ·8
5·6	58 ·5	28 ·0	30 ·5

All sealed thermometers stand too low when the pressure of the atmosphere is removed from their bulbs. The two just mentioned were found to be each 1°·5 too low in an exhausted receiver. Hence most of the numbers in the second and third columns still require to be more or less corrected for this, according to the degree of exhaustion; but since both thermometers were equally affected, the depressions have nothing to do with it. However, the included air seems to have been really a little cooled from the influence of the cold wet bulb.

We have always been puzzled to account for the extreme smallness of Dr Anderson's depressions in the fourth column. Perhaps he had used very weak sulphuric acid, or too small a surface of it; or he might not be aware that the full effect in a single case is seldom attained in less than half an hour. The pressure and temperature in his first case are nearly the same as in Mr Meikle's; and yet the depression 4°·86 is not half of 11°·6. From many trials we know that the weather is by no means very droughty, if a wet thermometer do not fall more than 4°·86, when only exposed in the open air at 48°·5, without any sulphu-

Evaporation.

ric acid at all. To increase the cold in a wet thermometer, Dr Lardner recommends exposing it to the sun. But whoever takes the trouble of properly trying this, will find that the sun has quite the contrary effect; and therefore the doctor is just in the same delusion, only on a greater scale, when he directs his readers to wrap wine bottles in wet cloth, and expose them to the sun as a source of greater cold! The sun, like the fire, aids evaporation, by supplying heat, which will more or less counteract the cooling effect, and may even raise the temperature; but common sense revolts at the very idea of the heating rays of the sun being a source of cold.

In 1827, Professor Daniell published, in the second edition of his *Essays*, p. 499, a series of experiments on the cooling effects of evaporation, and which, like Mr Meikle's, were made by means of two common thermometers, the one dry and the other moist; but he seems only to have read off to the nearest half degree; and his depressions, though not so deficient as those of Dr Anderson, still lean considerably to the same side. The following are his results, arranged as the preceding:

Mr Daniell's experiments.

30·2	50°	41°	9°
15·1	49	37	12
7·5	49	34	15
3·7	49·5	31·5	18
1·8	49·5	28·5	21
.9	49	24·5	24·5
·4	49	23	26

From repeated experiments we have found that at the temperature of 50°, and under a pressure of about thirty inches, a wet thermometer, when inclosed in a receiver along with a sufficiently large surface of strong sulphuric acid, should fall 12°·1 or 12°·2, in place of 9°, as Mr Daniell has it. The rest of his depressions are still more deficient; but when we attend to the disposition of his apparatus, our surprise rather is that the depressions should be so great as they are. What we particularly object to is his not only inclosing a vessel with water under the receiver, but interposing it directly between the wet bulb and the sulphuric acid. This he did for the purpose of occasionally dipping that bulb in the water; a precaution which was not only unnecessary, but which, by rendering the air moist and obstructing the drying of the bulb, must obviously have rendered the whole of his depressions much smaller than they should have been in perfectly dry air. When Mr Meikle made his experiments, and they were published before those of Mr Daniell, he satisfied himself that if the thermometer was properly covered and moistened at first, no renewal of moisture was necessary. This he ascertained by repeating, in a retrograde order, the different cases when he had just completed a series of these experiments; for on finishing with the case in which the air was most rarefied, he readmitted as much air as just brought back the gauge to the next case, which being repeated, he readmitted more air for the next, and so on, till he had got back over the whole series. In every case, the wet thermometer was found to be as much depressed in the backward process as in the forward, a clear proof that there was no lack of moisture. Neither Dr Anderson nor Professor Daniell say whether they made any allowance for the effects of pressure on the bulbs of their thermometers.

Cold not yet observed in vaporizing turpentine.

Oil of turpentine is well known to evaporate very quickly, but we have as yet failed to detect any cold that it produces, though we do not therefore suppose it forms any exception to the general law. Some liquids, as alcohol, ether, sulphuret of carbon, &c. both evaporate more rapidly than water does, and produce a greater cold; but the expenditure of heat is greater in vaporizing a given weight of water than of any other liquid yet examined; a fact from which it had often been concluded that alcohol could be vaporized with so much less fuel than water, that its vapour would be an economical substitute for steam as a first mover; nay, this had become a standard doctrine in almost every scientific compilation. It however involved a fatal oversight, as was first pointed out by Mr Meikle in the *Philosophical Magazine* for July 1826, p. 41, and afterwards by Mr Ainger in Brande's *Journal of Science* for March 1830; for it is not with equal *weights*, but with equal *volumes* of these vapours, that the comparison falls to be made; and when this is done, the greater rarity of steam puts it on at least an equal footing with alcoholic vapour, so far as regards the economy of heat. In other respects, steam is decidedly preferable; for, independently of the enormous expense of alcohol, the density of its vapour, being about 2·5 times that of steam, would prevent it from moving with the same facility through the pipes, valves, &c.

Supposed economical use of alcohol.

Mode of freezing alcohol.

Perhaps it may not be altogether foreign to our subject to mention, that Mr Hutton froze alcohol by condensing air on it in a strong vessel, which being very much cooled by freezing mixtures, was next suddenly opened, when the dilatation of the air, and the consequently rapid evaporation and re-expansion of the alcohol, absorbed so much heat as induced a cold sufficient to freeze it.

Damp clothes, &c. suppress the perspiration.

The bad effects of damp clothes, beds, &c. are usually ascribed to the cold attending the evaporation of the damp; but since considerable injury often follows where scarcely any cold is felt, we suspect the chief cause lies rather in the moisture suppressing the natural evaporation from the skin. The heavy smell which accompanies most dogs, and the fetid grease upon their hair, show that they perspire in some other shape besides what some suppose the only one from their tongues.

Imperfection in the measures of evaporation.

Various instruments have been employed to measure the rate at which moisture escapes into the atmosphere. We have already alluded to the method of exposing water in a vessel, and noting the loss. The vessel is generally circular, with a roof a little above it to keep off the rain, &c.; and, for greater accuracy, the contents may either be weighed from time to time, or measured in a graduated tube. When the vessel is brim full, the wind is apt to blow some of the water over; and when not full, the water is in some measure sheltered from the drying effects of the wind. The only use of such an instrument or gauge is to give us a very vague idea of the drying power of the air. It affords no measure whatever of the evaporation from the ground; for when the soil is exceedingly parched, and consequently has next to no moisture to give off, the gauge generally shows the greatest evaporation of all. Yet in stating the particulars of the climate of a place, it is usual to mention the amount of evaporation derived most probably from no better source. But it cannot even be a measure of the evaporation from a lake, because in that case the indications of the gauge depend very much on the direction of the wind; for it is obvious that if a previously dry wind traverse an extensive lake before reaching the gauge, it may by that time have become so humid as to show little or no drying power at all upon the gauge. When, on the other hand, the wind passes first over the gauge, its indications are to be suspected of erring in excess, because the farther a wind continues to traverse the surface of a lake, the more will its drying power be impaired, and therefore the average rate of evaporation will be less than at the side next the gauge. For this reason the evaporation from a smaller surface of water is, *cæteris paribus*, greater in proportion to the area than from a larger. Whether any general rule could readily apply to this, we are unable to say. Perhaps something like an approximation to the relation between the area and evaporation in such circum-

Eve || Evelyn.

stances would be had by dividing the area by some root of its mean linear dimension taken in the direction of the wind, and multiplying by a constant. But this would not in the least rectify the indications of the gauge. Since similar objections must obviously attach to all gauges employed for this purpose, it would be of little use to give any farther account of them, or of the registers of evaporation with which many works otherwise valuable are so often encumbered.

No muriatic acid in sea air.

It had been long supposed that muriatic acid vapour existed in the atmosphere incumbent over the ocean or on the sea coasts; and various effects were ascribed to its presence. But from experiments detailed in the *Journal de Pharmacie* for November 1833, it appears that such effects are solely owing to minute drops of salt water or spray which have been swept into the atmosphere by the wind; and that, with the exception of the salt drops thus raised, though only when the sea is ruffled by the wind, sea-air contains neither muriates nor uncombined muriatic acid. At first sight we had some doubt whether this would account for the injurious effects of sea-air on vegetation; because the presence of common salt, if not in excess, is known to be beneficial. But perhaps the salt when united with the soil may operate as a cordial to the roots, while it may be noxious when in immediate contact with the stem or leaves, as is often the case with manure injudiciously applied close to the roots of plants.

Congelation in hot climates due to radiation.

In the method of forming ice in India by exposing water during the night to the aspect of a clear sky, the effect was for some time ascribed to evaporation; but Dr Wells ascertained that the water thus exposed gained in place of losing weight. Now it could only gain by being cooled below the dew point of the incumbent air; for it is only in that state that the air could yield a portion of its moisture to the water; and therefore the cold must be the effect of radiation, and not of evaporation. This was farther evident from the circumstance that wind which ought to have increased the evaporation prevented the freezing altogether. But independently of these considerations, water exposed in the open air could never be cooled to the freezing point by evaporation alone in a hot climate. Where such a thing occurs, the air must be unusually dry, even after its temperature scarcely amounts to 40°, or the atmospheric pressure must be very small; because the utmost evaporation that can be produced artificially under the ordinary pressure will little more than cool a wet thermometer from 40° to 32°; and the cooling effect on a vessel with water is not nearly so great, especially in the open air, if care be taken to avoid the influence of radiation under the aspect of a clear sky. It is true that, at Benares for instance, the surface of the ground, after becoming very cold by radiation, sometimes renders the incumbent still air also pretty cold; but this, by bringing the air to a state of saturation with moisture, totally unfits it for aiding the freezing by evaporation.

So great is the difference of opinion respecting the influence of electricity on evaporation, that we suspect it has not yet been sufficiently investigated. The use of evaporation in the arts and manufactures will be found under the respective articles. In addition to the various works noticed in this article, see Dr Thomas Young's *Natural Philosophy;* Wells *on Dew;* Pouillet's *Elemens de Physique et de Météorologie.* A variety of articles on this subject will be found in the different volumes of the *Philosophical Transactions,* and other scientific journals. (H. M—E.)

EVE, the mother of the human race. See ADAM.

EVECTION. See ASTRONOMY, iv. 36.

EVELYN, JOHN, author of the *Sylva, Memoirs,* &c., was born in 1620 at his father's seat of Wotton in Surrey. He was educated at the free school of Southover, near Lewes, whence he removed in 1637 to Baliol College, Oxford; on leaving which he began the study of law in the Middle Temple. In 1641 he went to Flanders, where he served for a short time as a volunteer; but soon returning home, he joined the king's army in the struggle now begun with the parliament. The following year saw him once more bent on foreign travel, and he accordingly set out with an old college companion on a tour through France, Italy, and Switzerland, in which countries he spent the next seven years of his life, studying men and manners, statistics and science, polite literature and the fine arts. In 1647 he married a daughter of Sir Richard Browne, the English ambassador at the French court; and when that gentleman's estate of Sayes Court was sequestered by parliament, Evelyn was allowed to become the purchaser of it. Here he lived in strict retirement during the period of the Protectorate, engaged in laying out the grounds and gardens, and turning to profitable account the results of his continental studies. During this period also he published a translation of the first book of Lucretius; Chrysostom's *Golden Book for the education of Children;* and the *French Gardener and English Vineyard.* At the Restoration, however, he began to take an honourable though not conspicuous part in public affairs; was appointed one of the commissioners for taking care of the sick, wounded, and prisoners, during the Dutch war; commissioner for the rebuilding of St Paul's after the great fire (of which an admirable account will be found in his Journal); and a member of the Board of Trade. He was also made a member of the Council of the Royal Society, to whose Transactions he continued all his life to contribute papers on the subjects towards which his early studies had been directed. His favourite pursuits were gardening and planting, upon which he wrote a number of treatises, appended to the fifth edition of the *Sylva, or a Discourse on Forest Trees, and the Propagation of Timber in His Majesty's Dominions,* published in 1644 by order of the Royal Society. The object of this treatise was to encourage planting throughout Great Britain, and it produced the desired effect in a manner very gratifying to the author. In 1699, on the death of his elder brother without children, Evelyn succeeded to the family estate of Wotton, to which he removed from Sayes Court, where he had lived happy and respected for upwards of forty years. He was succeeded in the occupancy of that house by the Czar Peter, who with his suite made sad havoc among Evelyn's well-trimmed yew-hedges and elaborate parterres. Evelyn did not live very long to enjoy his new position as head of his family; he died February 27, 1705, in the eighty-sixth year of his age. In the humbler walks of science Evelyn was a successful and persevering inquirer; a valuable pioneer, as he himself used to say, in the service of the Royal Society. His moral character was irreproachable, though he lived at a time when vice was an almost indispensable passport to favour and promotion; and the purity of his morals, his piety, his schemes of active benevolence, and the intellectual nature of his pursuits, were all such as to earn for him the respect even of the court-profligates, to whom his example was a standing rebuke. Altogether our history affords few better specimens of the accomplished and well-principled English gentleman. The most valuable of Evelyn's works (leaving out of account the *Sylva* already mentioned), is his *Diary and Correspondence,* and the *Memoirs of his Life and Writings,* which are valuable not only on account of their literary merits, but also as throwing much light on the times in which their author lived. His other works, which have long since been for the most part superseded, embrace treatises on Sculpture, Architecture, Painting, Numismatics, and certain social questions. A very detailed list of them will be found in Watt's *Bibliotheca.*

Evemerus.

EVEMERUS or EUHEMERUS, a Sicilian mythographer, who flourished in the latter half of the fourth century B.C.

He is noted chiefly for his *Sacred History*, the materials of which, he said, were derived from inscriptions on the walls and columns of temples in various parts of Greece. In this work he introduced a new method of interpreting the popular myths, asserting that the gods who formed the chief objects of popular worship had been originally heroes and conquerors, who had thus earned a claim to the veneration of their subjects. Till the end of the last century there were many who accepted this system of Evemerus, and the early Christians in especial appealed to it as a confirmation of their belief that the ancient mythology was merely an aggregate of fables of human invention. Evemerus, who was a firm upholder of the Cyrenaic philosophy, was violently attacked by some of the ancient authors, and even accused of atheism; not so much, however, on account of his mythology, as because he declared that he had visited Panchæa, a sort of southern Thule, and there picked up much of the information which he embodied in his work.

EVESHAM, a municipal and parliamentary borough and market-town of Worcestershire, 15 miles S.E. from Worcester, and 96 miles from London. It is situated in the vale of the same name on the Avon, over which there is an ancient stone bridge of eight arches, connecting it with Bengeworth parish, which forms part of the borough. The land around the town is of great fertility, and occupied chiefly as market gardens. The borough returns two members to parliament, and is governed by a mayor, four aldermen, and twelve councillors. Pop. (1851) 4605; registered electors 349. Evesham is a place of considerable antiquity, a monastery having been founded here as early as the beginning of the eighth century. Of this building almost the only remnant is a magnificent tower, built not long before the Reformation. This tower, which is considered the best extant specimen of the pointed ecclesiastical style of the sixteenth century, is 110 feet high, and 28 feet square at the base. The town has recently been much improved; the two main streets are wide and clean. Evesham has an old town-hall, several fine churches, a grammar-and other schools, savings-bank, dispensary, and several charities. The inhabitants are chiefly employed in the rearing of garden produce. Market-day, Monday. At Evesham was fought, on 4th August 1265, the famous battle between Prince, afterwards Edward I., and Simon de Montfort, Earl of Leicester, in which the latter was totally defeated, and he and his son slain.

EVIDENCE.

By evidence, taken in the widest sense of the term, is meant whatever is the ground of assent, or tends to generate belief in the statement of any fact or truth. The means by which men acquire a knowledge of all the facts or truths which evidence brings before them may be referred to two sources; for either the perceptive faculties of the individual himself, or the observations and conclusions of others, present them to the mind. The first may be called the evidence of personal experience, the latter is generally known as the evidence of testimony. The former embraces all the phenomena of consciousness, the intuitive perception of our own existence, and of what is actually passing in our minds, and also all the phenomena of the outer world afforded by the senses. The knowledge, therefore, which is derived from the evidence of sense, of memory, of deduction, induction or inference, and analogy, may be referred to this head; and its chief characteristic is, that it is superior in degree to that obtained through the experience of other men, inasmuch as we rely solely on the operation of our own faculties, and the belief resulting therefrom is lively and strong. In some instances this kind of evidence is fitted to produce belief in the very highest degree, as in the phenomena of self-consciousness, in an act of memory or perception, in which the evidence is immediate and irresistible, and commands instant belief. No process of reasoning, either demonstrative or probable, being necessary in its acquisition, the knowledge and the evidence on which it is believed are both called *intuitive*. Again, in regard to those truths which are not intuitive, but are embraced under the subjects investigated by demonstration, analogy, and induction, the knowledge is not immediate, but attained through the medium of reasoning. In the evidence of demonstration—the process by which a result is shown to be a necessary consequence of the premises from which it is asserted to follow on the supposition that these premises are admitted—the belief reaches to the highest degree of certainty; but induction and analogy only afford that assurance which amounts to high probability: they never reach to necessity, or absolute certainty; and of such truths the most that is affirmed of them is, that there is no reasonable doubt concerning them. Hence the evidence employed to discover these truths has received the name of moral or probable evidence, which is thus distinguished from the intuitions of consciousness, or the demonstrations of necessary relations. The word *probable* is not to be taken as indicating an inferior degree of evidence, but as a species, in which the truths of fact to be proved are not *necessary* but *contingent*. According to this definition, moral evidence includes those judgments which are based on the testimony of others vouching their observation or experience.

It is manifest that by far the greater portion of our knowledge is obtained through other men, and received by us as true on the evidence of testimony. So limited indeed is the experience of each individual of the human race, that without this communicated knowledge men could never have advanced beyond a rude state of existence. But, on the other hand, this source wants that certainty of truth which personal observation and reflection afford; for the degree of assurance which is produced in the human mind necessarily varies according to our confidence in the veracity of the narrators, the opportunities they have had, and the probability of the facts themselves. It follows that the credit due to the testimony of a witness depends, 1*st*, On his trustworthiness, and, 2*d*, on the probability of the fact attested. Two elements enter into the trustworthiness of a witness; 1*st*, His means of knowledge, and, 2*d*, his desire to report the truth.

In reference to the first of these, the witness must have had sufficient opportunity of observing what he describes, and he must have intellectual capacity to observe and remember the facts, and judge of their authenticity and character. As Bentham has remarked, "Where the botanist sees a rare and perhaps a new plant, the husbandman sees a weed; where the mineralogist sees a new ore, pregnant with some new metal, the labourer sees a lump of dirt, not distinguishable from the rest, unless it be by being heavier and more troublesome."

In estimating the intention of the witness to narrate the truth, we are influenced by various considerations. If he be a person on whose evidence we have relied on former occasions, or if we have credible proof of his having been a veracious witness, or if he be a stranger, or have formerly misled us, we either receive the testimony implicitly or with caution, or reject it altogether. The honesty of a witness is further affected by the presence or absence of motives to falsify his evidence. In proportion as we have no reason to

suspect the witness to be influenced by interest or passion, our confidence in the evidence rises. Other elements affect our belief in the trustworthiness of a witness; such as the likelihood of contradiction which might ensue did he deviate from the truth, his deportment in delivering his testimony, and the support his evidence receives from the concurrence of other witnesses. The last point is of the utmost importance, and where no suspicion of collusion or connivance exists, the agreement of several witnesses places the fact testified beyond all doubt. The credibility of each individual may then be left unconsidered, for that several should concur in all essential particulars and yet be insincere or incorrect amounts—such is our faith in human testimony—to an impossibility.

The degree of belief we give to matters of fact attested by others is much affected by the probability of the fact itself, that is, by its accordance with our previous experience. When an alleged fact is so repugnant to the laws of the material world that no amount of evidence can induce us to believe it, it is said to be impossible. But impossibility is a relative term, and bears a certain ratio to the state of human knowledge. In such circumstances, men conceive that the evidence is a mistake, either intentional or unintentional, and refuse to believe it. This subject has acquired great importance in consequence of Hume's argument, that miracles, that is, supernatural events, or, as they were wrongly called by him, "violations of the laws of nature," are incapable of proof, because they are contradicted by our ordinary experience and observation. The refutations of his argument have been numerous, and no farther notice need here be taken of it than to quote an observation from one of the most recent writers on the subject. Mill, in his *Logic*, has observed, "All that Hume has made out is that no evidence can prove a miracle to any one who did not previously believe the existence of a Being with supernatural power, or who believed himself to have full proof that the character of the Being whom he recognises is inconsistent with his having seen fit to interfere on the occasion in question." Hence, to establish the impossibility of a miracle, it is required to show that the intervention of supernatural agency is incompetent, or would not be exercised in producing the effect. The "firm and unalterable experience," upon which Hume so much relied, affords too narrow a basis even for sceptical philosophers in the ordinary affairs of life, and they are content to receive much of their knowledge, not from their own experience, but from that of other men. But it is true that statements which accord with facts we already know are received upon a lower degree of evidence than those which appear to us improbable in the present state of our knowledge. If the fact be of the latter kind, or entirely beyond the sphere of experience, we require, indeed, stronger evidence, but we should beware of undue distrust. This is shown in the story so often quoted from the days of Locke, in which the king of Siam, who was told by the Dutch ambassador that in his country water sometimes became so solid that an elephant might walk over it, thus replied, "Hitherto I have believed the strange things you have told me, because I look upon you as a man of sobriety and truth, but now I am sure you lie." The test of probability then is not personal experience only, but the nature and quality of the evidence adduced are also elements to be considered; and in proportion as the witnesses are more numerous and of higher credit, and have no interest to speak contrary to the truth, and are uncontradicted by others, the matter of fact ought to be more or less believed.

Besides these there are other principles on which reliance on testimony is based, and among others there may be mentioned the consistency of the different parts of the narrative. There must be no contradiction between the various facts attested by the witness. For if it be self-contradictory, the evidence cannot be received. But if the contradiction lies in some cause or effect erroneously added by the witness to the fact, then the latter remains unshaken; for it is only the inconsistency of the facts themselves which destroys the credibility of a witness. If, again, there be several witnesses to the facts, the weight of their testimony depends on their mutual consistency. If one witness should either omit a matter of importance attested by another, or contradict the other's narrative by some positive discrepancy, discredit is thrown on the evidence, which will fall to be rejected altogether, or a preference given to one rather than another according to the trustworthiness of the particular witnesses.

In all questions of fact there appears to be in the human mind an instinctive reliance on testimony based on the knowledge of the natural inclination of men to speak the truth. These principles are relative and correlative of each other, and have been called by some the instinctive principle of credulity and counter principle of veracity. It is not necessary here to inquire whether belief in testimony is an ultimate or innate principle of the human mind; it is undoubtedly true that it is modified by experience. But there is another basis, upon which circumstantial evidence rests, of a totally different character. It is founded wholly on the relation and connection subsisting between collateral facts or circumstances and the fact to be proved. It is similar to the principle so well known in physical and moral investigations and analyses—the impossibility of accounting for the facts on any other hypothesis. It is thus the philosopher or historian endeavours to establish some doubtful truth by inference or analogy more or less remote, and a chain of facts and circumstances connects the accused with the crime in such a way as to exclude the hypothesis of innocence. It is in questions of this nature that the judgments of men are found continually to differ. The most opposite opinions are formed as to the credence and weight due to the circumstances adduced; and a scientific question, or historical fact, or alleged crime, which one man considers as not only probable but as certain truth, another holds to be impossible. The hypothesis is more likely to be true in proportion to the greater number of circumstances; and in general the mind is satisfied if the evidence on the whole coincides with and supports the hypothesis which it is adduced to prove, and a conclusion as satisfactory as direct evidence can produce is frequently founded on circumstances alone. But in criminal cases, in which circumstantial evidence is so frequently used, greater strictness is required. It is essential that every circumstance necessary to the hypothesis should be satisfactorily proved. If one of the links be wanting, or not established by proof, then the basis is defective, and no conclusion can be drawn. Moreover it ought to be impossible to draw any other conclusion from the circumstances than that proposed to be proved, for their possible combinations are so numerous that the acutest intellect may be baffled in discovering the connecting link. But when every other hypothesis is excluded, the conclusion is forced upon the mind with an even stronger conviction than in direct evidence, for in the latter case the testimony of personal observation is felt to be more fallible than the connection between the circumstances and the conclusion drawn.

Various arbitrary divisions of evidence have been made of which it is here necessary to mention only two. Evidence is either direct or indirect—original or transmitted It is direct, when the fact is attested by those who speak from their personal knowledge immediately; it is indirect, when the fact is inferred from other collateral facts clearly proved, which are supposed to have a relation proximate or remote to the fact in controversy. The latter is the circumstantial evidence of jurisprudence. Evidence is original, when it rests solely on the credit of the witness who attests

the fact; it is transmitted when it rests also on the veracity and competency of some other person, who has transmitted it to the reporter. It is manifest that if a man testify facts not lying within his own knowledge, but from information derived from others, the security for their truth is weakened in proportion to their remoteness from the original observer. "A credible man, vouching his knowledge of the thing itself," says Locke, "is a good proof; but if another equally credible do witness it from his report, the testimony is weaker, and a third that attests the hearsay of an hearsay is yet less considerable." Yet many historical truths depend on no other evidence than hearsay; and it is apparent that in the ordinary business of life, and in historical and philosophical investigation, transmitted evidence is frequently of the greatest value, being often the sole guide on which the inquirer proceeds.

Evidence (*Judicial*).—In the preceding part of this article, the rules of moral or probable evidence have been given. In jurisprudence, the practical importance of the subject has attracted much attention, and in every country a body of artificial rules has been framed on certain exclusive principles, differing considerably from those of natural or moral evidence. The divergence from natural equity has been so complete, that Mr Bentham states it to be his belief that if all the grounds of exclusion were collected into one from the various systems, including the Gentoo and Chinese, no witness in any cause could possibly be examined at all. In England the law of evidence in early times was extremely loose, and what was admissible seems to have depended on the tendencies of the judge. Accordingly, in the early state trials hearsay evidence is not unfrequently admitted; but though the law of evidence is a modern creation, the leading principles on which it is founded have been known from the earliest times; and the contrast between the two epochs seems to lie in this, that the judge now administers the law on fixed exclusive principles. The necessity or value of resorting to such exclusive principles has been denied by Bentham. Here it may be shortly observed that jurists trace the origin of the distinction between legal and natural evidence to the necessity of preventing fraud in the speedy action of judicial tribunals—of limiting the discretionary power of the judge as to the nature of the evidence to be admitted—of providing more certain tests of truth than are necessary in the ordinary affairs of life, and in the characteristic differences between legal and historical investigations. The result of these considerations has been to annex an artificial weight to particular evidence, or to set up certain exclusive rules.

The first general principle or rule is, that the best evidence of which the case in its nature is susceptible ought to be adduced. "The true meaning," says Gilbert, "of the rule of law that requires the greatest evidence that the nature of the thing is capable of, is this—That no such evidence shall be brought, which, *ex natura rei*, supposes still a greater evidence behind in the parties' own possession and power." This rule leads to the exclusion of all secondary evidence so long as any primary exists. Thus a written contract must be proved by the production of the deed itself, if it is within the power of the party. No copy or parole can be substituted in room of the principal unless it be proved to be destroyed or lost. Another consequence of this rule is, that all *hearsay* is rejected. Hearsay or transmitted evidence in law includes not only verbal reports, but also writings transcribed from the originals. It is excluded, not only because it supposes that better evidence exists, but it is also intrinsically weak, and affords a cover for the practice of fraud. Yet, where the necessity of the case requires it, hearsay ought to be admitted. Accordingly, it is received, 1*st*, in matters of public and general interest, where ancient rights are concerned, and the persons are supposed to be dead; 2*d*, in the case of declarations and entries made by deceased persons against their interest; 3*d*, both in criminal and civil cases the dying declaration of the injured party and the statements of a competent deceased witness are allowed to be proved under certain conditions.

The next general rule of evidence is, that the burden of proof lies on the party maintaining the affirmative of the question at issue, conformably to the maxim of the Roman law, "Ei incumbit probatio qui dicit, non qui negat." In explicating this rule, the onus of proof is determined by the affirmative in substance, not the affirmative in form; and the burden may be shifted by presumptions, either of law or of fact, or the capacity of the contending parties to adduce the evidence.

Two other general rules of evidence may be shortly stated without comment. The evidence must correspond with the allegations made by the parties. All beyond this is irrelevant, and the proof, if offered, is to be rejected. This rule confines the evidence to what is material and necessary to prove the case of the litigant. The other rule is, that the evidence must be sufficient to prove the substance of the issue. This rule protects the litigant from excessive strictness on the one hand, and on the other requires that nothing essentially descriptive of the claim or charge shall be wanting.

So many rules of exclusion have been recently abolished by statute, that it may be well to enumerate some of the objections of former and later times to the admissibility of witnesses.

1*st*, By the ancient practice of most European countries women were inadmissible; and even when admitted, their evidence was not considered equivalent to that of a man. So late as 1824, in some of the Swiss cantons, the testimony of two women was equal only to that of one man. In Scotland there exists a remnant of the former practice in the exclusion of females as witnesses to the subscription of deeds.

2*d*, Infamy of character was formerly a ground of exclusion. Wherever one had been convicted of a crime inferring infamy, he was perpetually disqualified. This was at first modified, and at length altogether abolished by Lord Denman's Evidence Act (6th and 7th Vict., cap. 85): in Scotland the equivalent statute is the 15th Vict., cap. 27.

3*d*, No witness can now decline to give evidence on the ground of relationship; and, with the single exception of husband and wife, relations may now be compelled to give evidence both for and against each other. By a statute passed in 1853, which, however, applies only to England, husbands and wives are competent and compellable to give evidence either for or against each other in any suit, with the exception of criminal cases. In both countries, where the party injured is one of the spouses, the other is of necessity a competent witness in the case.

4*th*, The objection of incompetency from *interest* has been also recently abolished. So far back as the time of Fielding, the impolicy of this ground of exclusion was observed; in his *Amelia* he thus criticises the law of evidence on this head:—"There is no branch of the law more bulky, more full of confusion and contradiction, I had almost said absurdity, than the law of evidence as it now stands. One rule of this law is that no man interested shall be sworn as a witness. By this is meant pecuniary interest; but are mankind governed by no passion but avarice? Are not pride, hatred, and the other passions, as powerful tyrants in the mind of man? And is not the interest which these passions propose to themselves, by the enjoyment of their object, as powerful a motive to evil as the hope of any pecuniary interest whatever?" Notwithstanding objections so apparent, the exclusion arising from interest was firmly fixed in our law, and was only recently removed in regard to witnesses, and still more recently in regard to the parties to the suit themselves.

5th, The only other grounds of objection, to which reference need be made, which have been removed by the legislature, are enmity, agency and partial counsel. It appears to be doubtful whether the last two ever did more in England than affect the credibility of the witness, and in Scotland they are now in the same position. The cause of this enlightened course of legislation is well stated in the preamble of Lord Denman's act, which recites that the inquiry after truth in courts of justice is often obstructed by incapacities created by the present law, and it was desirable that full information as to the facts in issue, both in criminal and civil cases, should be laid before the persons who are appointed to decide upon them, and that such persons should exercise their judgment on the credit of the witnesses adduced and on the truth of their testimony. The above objections have now accordingly become simply questions of credibility in the hands of the jury, and have been wholly removed from the province of the judge. The tendency of legislation and the inclination of our judges at the present time is to admit all evidence where it is *original;* when such testimony is excluded, all attainable proof bearing on the question in dispute may be destroyed, and substantial injustice done to one or other of the contending parties.

The means by which the matter of fact in dispute is proved before a judicial tribunal are called the instruments of evidence, and are either written or unwritten.

1st, Of Unwritten or Oral Evidence.—The law compels every one who is in possession of evidence bearing on the matter in dispute, to be a witness, and to attend as such at the trial. The witness must answer all relevant questions which do not criminate himself. And the court will interfere to protect a witness who is pressed to answer questions tending to bring disgrace upon him, unless the ends of justice clearly require it. All persons, male or female, who are of sane mind, and capable of understanding the oath to speak the truth, are admissible as witnesses.

Before the recent legislation, to which reference has been made, many rules existed as to the admissibility of witnesses. The only grounds of incompetency still existing in our law are two in number:—*1st*, From want of reason and maturity of intellect; and, *2d*, From professed want of religion.

Under those incompetent from want of reason, are included all idiots from birth, and fatuous persons, who have wholly lost intellect and memory, and those who have reduced themselves to that condition by their own vicious acts, as drunkards, and lunatics during the period of derangement; but lunatics in their lucid intervals, and monomaniacs in matters apart from the particular delusion, appear to be competent witnesses.

Children of tender years are likewise excluded from want of maturity of intellect. The old lawyers stated broadly that "infants under fourteen years of age are not to be examined upon their oath as witnesses." In modern times the rule is relaxed, and children are sworn as witnesses between the ages of twelve and fourteen, where the judge is satisfied that they understand the nature of an oath. In reference to children below twelve years, their admissibility depends upon the sense and reason, and the general intelligence they manifest, and their understanding as to the impropriety of falsehood; but they do not give evidence on oath, but simply emit a declaration, and the weight of the testimony is a question exclusively for the jury.

The only other ground of incompetency now known arises from the want of religious belief. Where the witness does not believe in the existence of a God, in the obligation of an oath, and in a future state of rewards and punishments, he is not admissible. It is not sufficient that he believes himself bound to speak the truth, merely from a regard to character, or the interests of society, or the fear of punishment by the temporal law.

2d, Of Written Evidence.—Documents, which may be put in evidence, are either public or private. To the former head may be referred acts of parliament, the judgments of courts, the acts of public functionaries, entries in public registers, and extracts from judicial records. The mere inspection by the court of evidence of this kind is sufficient. Acts of parliament are either public or private; those which are public are presumed to be known to all, and a reference by citation of the statute book is sufficient; as to those which are private, a copy compared with the official roll must be produced. Extracts of judicial proceedings under the seal of the court, and the proceedings of foreign judicatures, are received when authenticated in the manner required by the laws of the country. So entries in various public registers, as the register of births, deaths, and marriages, or of probative deeds, when certified by the proper official officer, are probative. Among *private* writings are regular deeds, wills, notarial instruments, and the executions of officers of the law. These must be executed and authenticated in the manner prescribed by the law of the country where the contract or obligation is entered into; and the execution of the deed must be proved by one at least of the attesting witnesses; but in Scotland, when certain solemnities required by statute are observed, a presumptive evidence arises in favour of the instrument, which is probative in all respects until it is challenged or reduced on the grounds of forgery, fraud, or error. Documents thus authenticated and proved are the highest species of evidence, and are superior to any oral proof of the transaction that could be offered. In truth, it is in general incompetent to endeavour to supersede or contradict a written instrument, or supply a defect or explain the intention of the writer by parole evidence. Parole is, however, competent in the challenge of a deed where fraud is alleged, or to prove a mistake or error.

The statutes passed recently to alter and amend the law of evidence have simplified and improved it to a great extent. Nor can there be any doubt that the course of legislation has been enlightened and in the true direction; nay, so much has been done, at least in removing grounds of *exclusion*, that little remains to be effected. Yet the expediency of rejecting any witness for incompetency may well be doubted. Wherever one has been an eye-witness to the facts in dispute, or can give testimony bearing on these, the law ought to admit the evidence. It is doubtful, therefore, whether the want of religious belief should remain a recognised ground of incompetency. Respect for character and social position, the principles of natural morality, and the fear of punishment in this life, may in such cases be as strong checks on perjury as the more formal appeal to divine vengeance in taking an oath. Unsworn testimony is received in certain instances; it might be extended to those who deny the obligation of an oath, but admit the strength of moral law, and the duty to society that each man should speak truth. Again, the English system of evidence neglects the preservation of written testimony. Public documents, deeds, and instruments used in the transmission of real property, contracts, and wills, ought to have been an object of solicitude to the government; and a speedy and cheap means of preserving such evidence has still to be discovered and put in practice. Bentham, and others after him, argue for the admission of hearsay or transmitted evidence under certain forms and conditions, so that a jury may weigh its value, and admit or reject it as circumstances demand. But the opening which this would give to fraud and dishonesty seems too palpable to hazard the experiment. In admitting it, all personal responsibility, and the safeguards of cross-examination, of publicity, and of the solemn obligation of an oath, would be removed. All those qualities in a witness on which his credibility depends, his disposition to speak the truth, and his power of observing and remembering, would also be unknown. Besides, it is often impossible to trace the source through which

hearsay is derived, or by how many channels it has been transmitted, till it reaches the party who is willing to give it forth as evidence. Its very existence, moreover, supposes that there are witnesses who can speak to the fact from their personal knowledge, and who ought therefore to be produced. Its infirmity is indeed self-evident, and when offered in a court of justice, in proof of recent events, it is wisely rejected.

The subject of evidence is admirably treated at great length, in an American work by Greenleaf, which has reached a sixth edition. The most recent English treatises of authority are those of Mr Starkie and Mr Best. (A. M.)

EVIL can only be defined as the antithesis or negation of *good*. In the abstract, evil is want of conformity to the standard of good, whatever that may be; in the concrete, evil is anything that comes short of what is perfectly good. Evil is thus a simply negative conception, *i. e.* relatively to good, which has a positive existence *per se*, merely predicates non-existence in certain cases. Origen (*de Princip.*, ii. 9, 2): "Πᾶσα ἡ κακία οὐδέν ἐστιν, ἐπεὶ καὶ οὐκ ὂν τυγχάνει." Augustine (*de Civ. Dei*, l. ii., c. 22): "Cum omnino natura nulla sit malum, nomenque hoc non sit nisi privationis boni," &c.

A threefold division of evil has been signalized, viz., into *Metaphysical*, *Physical*, and *Moral*. Leibnitz has discriminated these thus: "Metaphysicum generatim consistit in rerum etiam non intelligentium imperfectione; physicum accipitur speciatim de substantiarum intelligentium incommodis; morale de earum actionibus viciosis" (*Causa Dei Assert.*, § 30–32). Or we may state the distinction thus:—Every existence has an ideal perfection; when it comes short of that, there is evil. Every intelligent existence has its own happiness as its end; when it is impeded in the pursuit of that end, there is evil. Every intelligent existence is subject to certain moral laws, in obedience to which it is bound to seek that end; whenever any of these laws is evaded or transgressed, there is evil. It may, however, be doubted whether the first of these should not, as well as the other two, be restricted to *intelligent* existences; inasmuch as it is only as it affects them, that imperfection in themselves or in other existences is an evil. It may be further observed, that even in reference to intelligent existences imperfection is not so much an evil as a possible cause of evil; for limitation, or even defect, if it do not lead to unhappiness or sin, cannot with strict propriety be called an evil. It may be as good for a creature to be imperfect *quoad* an ideal standard of perfection, as to be perfect—provided no consequences injurious to his physical or moral well-being result thence.

We may satisfy ourselves, then, with a twofold division of evil—physical and moral; understanding by the former whatever is opposed to good in the sense of happiness, by the latter whatever is opposed to good in the sense of rectitude or virtue. The terms *physical* and *moral* seem sufficiently definite for ordinary purposes as thus used; but if a more exact and scientific expression be required, we may take that of Kant, who discriminates evil into the absolutely evil and the relatively evil; the former designating that which is opposed to the absolutely good, and which cannot be chosen by perfect wisdom and holiness, either for itself or as a means to an end; the latter denoting that which is opposed to the relatively good—the good for a special end, and which may be chosen by perfect wisdom and holiness, if not for itself, yet as a means to an end.

Moral evil has often been identified with *sin*. It would be more correct to say that sin is moral evil viewed under a certain relation, viz., as difformity from an express law: "illegalitas seu difformitas a lege," Calovius *System. Locc. Theoll.*, v., p. 14. Moral evil is the absolutely evil, the *malum in se;* sin is moral evil as a thing forbidden by God, *malum prohibitum;* and as the commission of what is forbidden entails guilt and exposes to blame, this latter becomes also *malum culpæ*.

The relations of physical and moral evil may be stated thus:—1. Physical evil is by the divine ordinance the consequence of moral evil, and frequently the outward exponent of what is in itself hid from created vision; 2. Physical evil is *malum pœnæ*, the punishment which is made to fall upon the being who has been guilty of the *malum culpæ:* Grotius (*De Jure*, l. ii., c. 20, § 1)—"Est autem pœna generali significatu malum passionis quod infligitur ob malum actionis;" Augustine (*cont. Adim.* c. 26): "Dupliciter appellatur malum, unum quod homo facit, alterum quod patitur; quod facit peccatum est, quod patitur pœna. Divina Providentia cuncta moderante et gubernante, ita homo male facit quod vult, ut male patiatur quod non vult;" 3. Physical evil may often be the means of preventing moral evil by securing the opposite good; it may thus become not merely, as Hierocles terms it, πονηρίας ἰατρική, but even a subsidiary or mediate good: Leibnitz (*De causa Dei*, § 35)—"Mala physica interdum fiunt bona subsidiata tanquam media ad majora bona;" 4. The converse may not lawfully take place; moral evil may not be resorted to as a means of averting physical evil; in the government of the world God never directly wills evil that good may come, and he has forbidden this to us; 5. It is nevertheless possible, for aught we know to the contrary, that moral evil may be the condition without which intelligent creature existence cannot reach its highest and most perfect development, *i. e.*, become entirely and for ever superior to all defect and evil; and for this reason, though not directly willed by God, it may be permitted by him.

Attempts have been made to subvert this distinction between physical and moral evil, and to generalize all evil under one category. On the one hand, the sensualistic or eudaimonistic school, by resolving all good into happiness, make pain and suffering the only kind of evil that can befal a creature; and, on the other hand, it has been contended that sin is the only evil, as without it there would be no suffering and no punishment. But both these generalizations are fallacious. In the former, sin is confounded with its concomitant penalty; in the latter, the concomitant penalty is subsumed as a part of the sin of which it is the effect or result. As the pleasure which God has made to attend on goodness is not itself goodness; so the pain which he has made to attend on sin must ever be carefully discriminated from sin itself.

Of all questions connected with evil the most perplexing is that which respects its *origin*. Πόθεν τὸ κακὸν; this is an inquiry which, from the dawn of speculation, has excited the curiosity and exercised the ingenuity of thoughtful men. Our limits permit us only to state in the briefest manner the different hypotheses which have been suggested for the solution of this problem. These may be classed under three heads—the Dualistic, the Pantheistic, and the Monoistic. Of these the Dualistic may be regarded as the most ancient and most widely diffused, as well as perhaps the one most likely to occur to the mind on first contemplating the phenomena of the world. According to it, good and evil are absolutely distinct essences, the products of two original principles, one of good and the other of evil, from whose agency the good and evil we see actually mixed in the world have respectively flowed. This hypothesis has appeared in different forms, of which the principal are these: 1. *Parseeism*, which supposes that the universe was created by two rival powers, Hormuzd or Light, and Ahriman or Darkness; the latter of whom produced some evil thing for every

good thing which was made by the former. 2. *Hylism*, which regards matter (ὕλη) as the original eternal principle of evil, in opposition to the good spirit or God; whether this original Hyle be viewed as feminine and passive, as in the Chinese cosmogony, or as a dead and formless mass quickened by a blind senseless soul, as among the Greeks. 3. *Gnosticism*, which is the heathenish doctrine modified by certain Christian opinions, and exists under two principal aspects as presented by (1) the Syrian Gnosticism, Marcionism, and Manichæism, all of which closely approximate to the Parsee doctrine, and (2) the Alexandrian Gnosticism, as developed by Basilides and Valentinus, and in which the Hellenic doctrine of the Hyle predominates.[1]

In the Pantheistic hypothesis, evil and good are viewed as only varied manifestations of the one original principle. This appears in its grossest form in the Hindu system, and in that of Spinoza; but it is also to be traced in some of the more refined speculations of the modern absolute philosophy of Germany, as *e. g.* in the earlier philosophy of Schelling, who placed evil in the discord, and good in the concord, of the individual will with the universal will, but held both to be one in God.

In the Monoistic hypothesis, evil is regarded as either the necessary condition of good, or as a result flowing from the necessarily limited and imperfect nature of creature existence. This latter view, which, from the prominent use by its advocates of the expression "mundus optimus," is generally known as the *optimist* view, is that adopted by Augustine, by Leibnitz, and by Archbishop King, all of whom have attempted to reconcile the existence of evil within the government of a perfectly holy, good, and powerful being, by treating it as a necessary result of creature limitation; though there be differences on subordinate points between them.

It must be admitted that none of these modes of solving the difficulty is satisfactory. The Dualistic hypothesis has found no supporters of any note in more recent times, if we except Bayle; whose defence of it, however, is to be looked upon rather as a piece of literary gymnastic than as the result of serious conviction. The Pantheistic hypothesis contradicts our moral consciousness, and is besides based on a theory of the relation of the universe to God which reason refuses to authenticate, and which piety abhors. The doctrine that evil has its origin in the necessary imperfection of the creature has, under one or other of its modifications, found the largest number of supporters in modern times; but when stripped of the garnishing in which its advocates have enveloped it, this hypothesis will be found to involve a fallacy so gross and palpable that it seems surprising that it should have ever imposed upon any logical understanding. For in what sense are we to take the weighty word *imperfection* as here used? Take it in a moral sense as equivalent to *faultiness* or *vitiosity*, and the proposition that there is evil in creation because creation is imperfect, becomes a purely identical one, and the origin of evil is virtually referred to the Creator, of whom in this case we must say with the Epicureans "aut vult, aut non potest tollere malum." Take it in a metaphysical sense, as equivalent to *limitation*, and the assertion simply affirms the creation to be potentially evil; it in no way explains how that potentiality was developed into an actuality, which is the real question at issue.

On this question the Bible throws no light; it merely informs us that evil did not originate with man or in this world, but was brought hither by a spirit who had previously fallen in some other part of the universe. The Bible, however, fully authorizes the only conclusions to which reason can safely come on this dark subject, viz., 1. That God is not the author of evil in any sense; 2. That though able to prevent it, he has permitted it to exist; 3. That the evil permitted in the universe is not only less than the good directly willed by God, but is characterized as something intrusive and transitory, while the good is fundamental and permanent; 4. That God in permitting evil has not left it uncontrolled, but ever holds it in his power, and makes it subservient to his purposes; 5. That he will ultimately overrule this evil which he has permitted, so as to evolve a larger amount of good for his universe than if evil had not been permitted; and, *in fine*, that all that is perplexing to us in the existence of evil arises out of the limitation of our understanding, and that as in the natural world many phenomena which to the untutored mind appear anomalous, are by the philosopher seen to be in accordance with law, and necessary parts of the cosmical system, so the phenomenon of evil, which to us is so full of difficulty, may by higher intelligences—must by the highest, be seen to be in perfect accordance with the noblest order and the purest rectitude. (Bayle's Dictionary, arts. Manichæan and Paulician; Leibnitz, Essai de Theodicée, and his Causa Dei Asserta per Justitiam ejus, &c.; King on the Origin of Evil, translated by Law; Whateley's Remarks on King, appended to his edition of King's Discourse on Predestination; Lord Brougham's Dissertation on the Origin of Evil, appended to his edition of Paley's Natural Theology; Stewart's Active and Moral Powers, vol. ii., p. 109, foll.; Müller on Sin, translated by Pulsford, 2 vols. Herbart, Gespräche ueb. das Böse, 1817.) (W. L. A.)

EVIL-EYE, a malignant influence superstitiously ascribed to certain persons, in virtue of which they are supposed to injure those on whom they cast an envious or hostile look. This ancient superstition is still prevalent among many nations, especially the American Indians, and among the ignorant even in some of the most civilized countries of Europe.

King's Evil, a name formerly given in England to the disease called scrofula, from the belief that the touch of the king could effect a cure. This superstition is as old as the time of Edward the Confessor; and must have been credited even so late as the beginning of the last century, since we are told that the celebrated Dr Johnson was "touched" for the cure of this disease.

EVOCATI, in the ancient Roman army, were those soldiers who, after having received their *missio*, or full discharge from service, were called upon to do military duty as volunteers. In every great army the number of these veterans appears to have been considerable.

EVOLUTION, the act of unfolding or unrolling. In physiology it is used to denote that theory of generation which maintains that the embryon or germ pre-exists in the parent, and that its parts are merely unfolded and developed by the procreative acts. This theory stands opposed to that of *Epigenesis*, in which the germ is held to be *formed* by virtue of the procreative powers of the parent. See PHYSIOLOGY.

EVORA or EBORA, the ancient *Liberalitas Juliæ*, a city of Portugal, capital of the province of Alemtejo, is situated on an eminence in the centre of a fertile plain, 85 miles E. by S. of Lisbon. It is surrounded by ramparts flanked with towers, and has two forts, but these are all in a ruinous condition, and quite useless as means of defence. The streets are narrow, crooked, and filthy, and the houses old and ill-built. The cathedral is a magnificent Gothic edifice with an altar in the Italian style, extremely rich, and decorated with variously coloured marbles. Evora is the see of an archbishop, and besides the cathedral has several churches, convents, and hospitals, a house of charity, barracks, diocesan school, and museum. This city was in existence in the time of the Romans, and was for a lengthened period the headquarters of Quintus Sertorius, by whom it was fortified and adorned with several fine public buildings.

[1] See Neander, *Church History*, vol. ii., p. 51, Eng. tr.

An ancient aqueduct in good preservation, and the ruins of a temple, of which some columns are still standing, evidently belong to the best period of Roman architecture. Pop. about 12,000.

EVREMOND, Charles Margotelle de St Denys, Sieur de St Evremond, a literary and social celebrity of the seventeenth century, was born at St Denis du Guast, near Coutances in Normandy, April 1, 1613. Destined for the priesthood, St Evermond began his studies under the Jesuits of Paris, but at an early age, exchanging that career for the more congenial one of a military life, he obtained a lieutenancy in the guards from the great Condé, who took much pleasure in his society, and delighted in the brilliant and caustic wit by which even thus early the young soldier had forced himself into notice. Under this illustrious commander St Evremond fought with distinction at the bloody battles of Rocroi, Fribourg, and Nordlingen, in the last of which he was wounded. His irrepressible fondness for raillery and satire proved on more than one occasion the bane of his life; and Condé hearing that his young lieutenant had been laughing at his expense, deprived him of his commission. During the troubles of the Fronde, St Evremond offered his sword and his pen to Cardinal Mazarin, who rewarded his zeal with a pension and the rank of maréchal-de-camp. But his luck with the cardinal was no better than it had been with Condé. He accompanied him on his mission to negotiate the treaty of the Pyrenees, and wrote to Marshal Créqui an account of the proceedings, in which the various diplomatists and their measures were so bitterly satirized, that when the affair reached the king's ears he resolved to commit St Evremond to the Bastile. The satirist, however, being warned of the king's intention, fled to Holland, and in the following year (1662) to the English court, where he was well received, and had many powerful friends. In these two countries he spent the remainder of his long life, and could never be persuaded to avail himself of the pardon which his friends in France, with great difficulty, extorted for him from the Grand Monarque. His life at the English court was one of unclouded sunshine. He enjoyed the society of all the political, social, and literary notabilities of the day, and had from the king a pension that more than sufficed for his wants; and though on the accession of James II. he was deprived of his pension, yet at the revolution which placed William of Orange on the throne, his position was so much bettered that he obstinately refused to return to his native country. The remainder of his long life he spent in the moderate enjoyment of everything that could minister to his social and intellectual necessities. Though he was little better than a pleasure-hunter all his life, he retained his health and mental faculties unimpaired till his death, which happened September 20th 1703, in the ninety-first year of his age. The writings, both prose and poetical, of St Evremond, are, for the most part, quite unworthy of the reputation he enjoyed during his lifetime. Though the criticism of Mr Hallam may seem somewhat severe, it is in the main quite justifiable. "Nothing," says that critic, "can be more trifling than the general character of St Evremond's writings; but sometimes he rises to literary criticism, or even civil history: and on such topics he is clear, unaffected, cold, without imagination or sensibility; a type of the frigid being whom an aristocratic and highly polished society is apt to produce. The chief merit of St Evremond is in his style and manner. He has less wit than Voiture, who contributed to form him, or than Voltaire, whom he contributed to form; but he shows neither the effort of the former, nor the restlessness of the latter." Of his poetry nothing repays perusal, if we except, perhaps, the quatrain which he wrote under the picture of the celebrated Ninon de l'Enclos. Of his numerous prose works the best is his *Réflexions sur les divers génies du Peuple Romain*, which contains many acute and ingenious ideas. His letters are admirable specimens of a kind of composition in which the French have always excelled. Though by no means a religious man, St Evremond neither himself sneered at Revelation, nor encouraged others to do so; the charge of atheism preferred against him arose from the fact, that after his death certain atheistical works were published under his name, with which he had in reality nothing whatever to do. There have been numerous editions of his works, but the best is that of *Des Maizeaux*, 3 vols. 4to, London, 1705, with a life, the conjoint production of the author and his editor.

EVREUX (the ancient *Mediolanum*, and afterwards *Eburovices*), a town of France, capital of the department of Eure on the Iton, an affluent of the Eure, 54 miles W.N.W. of Paris. Pop. (1851) 11,644. The town is generally well-built, and still contains many antique timber-framed houses. The cathedral is one of the most ancient and curious in France. It is a very imposing cruciform structure, though not uniform in style. The north transept and the portal are in the flamboyant Gothic, elaborately ornamented; the west front is in the Italian style. The beautiful rose window in the south transept, and the wooden screens of the side chapels round the choir, showing the flamboyant Gothic style modified by the reviving Italian, also merit notice. The Lady chapel is of elegant architecture, with painted glass equally remarkable for its fine execution and perfect preservation. At the intersection of the nave and transepts rises an octagonal tower supported on four pillars, and surmounted by a pyramidal spire of open stonework. The church of St Taurin also displays various styles of architecture, and contains the shrine of St Taurin, a work of the thirteenth century. Among the other objects of interest are the clock-tower built in the fifteenth century, the bishop's palace, town-hall, prefect's residence, prison, theatre, public library, botanic garden, and the promenades. The chief manufactures are woollen and cotton stuffs, leather, tickings, &c. Excavations made at Vieil Evreux have led to the discovery of a theatre, baths, &c., and of various relics now deposited in the Musée d'Antiquités.

Mediolanum was the capital of the Aulerci Eburovices, and hence it took the name of Eburovices, which in the middle ages was corrupted into Ebroicæ and Ebroas; whence the modern name. In 892 it was taken and sacked by Rollo the Norman; and in 989 Richard I. duke of Normandy erected it into a county in favour of his natural son Robert, who died in 1037. He was succeeded by his eldest son Richard, who followed William the Conqueror into England in 1066, and died the following year. His son William, who succeeded him, received a large grant of lands from the Conqueror for services rendered by his father and himself. This line became extinct in 1118, when the duke of Montfort, as the nearest heir, took possession of the estates; but his claim was disputed by Henry I. of England, who took and burnt Evreux, and obliged the duke to sue for peace. In 1193, Philip-Augustus, king of France, took the town, and gave it to prince John of England (called Lackland); who, in order to conciliate his brother Richard (who was now released from captivity), invited the French garrison to a splendid banquet, and butchered his unsuspecting victims, to the number of 300, in cold blood. In revenge for this act of treachery, Philip reduced the town to ashes. In 1199 it was burnt a second time by Philip, who soon afterwards obtained permanent possession of it. In the wars between France and England, this town frequently changed its masters. In 1441, after a vigorous resistance, it fell into the hands of the French; and shortly before the battle of Ivry it was besieged and taken by the celebrated Biron.

EWALD, Johannes, the most remarkable poet of Denmark during the eighteenth century, was born November 18, 1743, at Copenhagen, where his father was a preacher

and director of the Orphan Hospital. The elder Ewald was a man of considerable ability and learning, but was prevented by ill-health from personally educating his three sons, the second and most gifted of whom, the future poet, was sent to Sleswig. Here his master allowed him to gratify his own taste in the choice of books selected for perusal. The legends of the saints which he devoured inflamed his imagination, and tempted him to the study of the Ethiopic tongues, with a view to becoming the apostle of the African negroes. By his parents he was destined for the church; but the perusal of *Tom Jones* and *Robinson Crusoe* took such a strong hold of his mind, that at the age of thirteen he ran away from school, intending to find his way to Holland, and thence take ship for Batavia, where he hoped to find a desert island like that which had originally fixed his fancy. He was overtaken in his flight, however, and compelled for the present to abandon his project. Renouncing the ecclesiastical career, as affording no adequate field for his spirit of romantic enterprise, he longed to become a soldier; and the Seven Years' war raging at this time, he enlisted as a private in a Prussian regiment of hussars stationed at Hamburg. Being transferred against his will to an infantry regiment, he deserted to the Austrian service, and there distinguishing himself was offered promotion, which however, as necessitating him to abjure his Protestant faith, he declined. To the selection of a military career he was driven not only by inclination, but by a disappointment in love, which produced a powerful impression, and exercised a lasting influence on his mind. The object of his love, whom he has celebrated under the name of Arense, bestowed her hand upon another; and this disappointment, though it cast a deep gloom for a time over the life of Ewald, was probably useful as developing in him those powers of earnest feeling and genuine pathos which distinguish many of his compositions, especially his *Death of Balder*. After he had served for a while with the Austrians in Bohemia, and taken part in the defence of Dresden against the Prussians, his family purchased his discharge, and he returned to Copenhagen. His state of mind was not such as to permit him to renew his theological studies, and he accordingly sought relief for his wounded feelings in the pursuits of literature. He was at this time only twenty-two years of age, and does not appear to have had any idea himself of the genius latent within him. An occasion, however, soon occurred which developed it. Frederick V. of Denmark happened to die at the moment when young Ewald was sunk in the deepest gloom and despondency from his repeated disappointments. In commemoration of this event he composed a funeral dirge, which attracted general admiration, and tempted the author to devote his whole energies for the future to the career of literature. Encouraged by the Royal Academy of Copenhagen, and assisted by the advice of Klopstock, then residing there, he produced his *Lykken's Temple* (Temple of Fame), and shortly after his drama of *Adam and Eve*, both works which bear the imprint of true poetic genius, but are in many respects faulty and crude. Conscious now of his weakness as well as of his power, he began a careful study of the best poetical models, especially of Shakspeare, hitherto accessible to him only in Wieland's translation. As the first-fruits of these studies, he produced in 1770 his *Rolf Krage*, a tragedy taken from the ancient history of his country, and bearing strong traces of the author's recent perusal of Ossian, of whose poems he was a devoted admirer. Though this work was greatly admired, it did little towards ameliorating his condition in life, which was rendered doubly distressing by poverty and disease. He bore bravely up against his sufferings, however, and besides the many *pièces de circonstance* by which he sought to earn a livelihood, he was able in the course of a short time to publish his *Harlequin Patriot*, a sort of satire upon the would-be reformers of his time, replete with strong common sense, pungent sarcasm, and pleasant humour. In 1773 appeared his greatest work, *The Death of Balder* (Balders Död), the subject of which is taken from the mythology of the Edda. Nothing in the same vein had hitherto appeared in the Danish tongue that could stand comparison with the wonderful poetic beauty of this drama; yet its merits were so ill appreciated by his countrymen, that they allowed him to struggle on unaided against the poverty and disease that tormented his declining years. In remarkable contrast to Ewald's poetical works, stand his prose compositions, some of which, such as his *Project Concerning Old Bachelors*, exhibit great powers of comic humour and pleasant raillery, all the more noteworthy when we remember the circumstances under which they were produced. In this respect the case of Ewald presents a striking analogy to the early literary history of J. P. Richter in Germany, and the later career of our own Cowper; and the analogy between Ewald's case and Cowper's is still more curiously borne out by the fact, that each of these poets was cheered towards the latter end by the sympathy and solicitude of a female friend. The story of Mary Unwin is known wherever the English tongue is spoken; the equally noble and self-sacrificing devotion of Madame Skou, if not so widely known, deserves an equally warm tribute at our hands. Under the roof of this lady, who had latterly devoted all her care and time to his service, Ewald died, March 17, 1781, after a painful and distressing illness of nearly two years. The edition of his works which he was engaged in superintending at the time of death, was not finally completed till 1791. The second edition did not appear till 1814–16. A biography of the poet by Molbech was published at Copenhagen in 1830.

EX, or EXE, a river of England, which rises in a barren tract of land called Exmoor, in the county of Somerset, and after being enlarged by several accessions, passes Tiverton, Exeter, and Topsham, and falls into the English channel at Exmouth, after a course of about 45 miles. It is navigable by vessels of considerable burden to Topsham, 8 miles from its mouth.

EXALTATION OF THE CROSS, a feast of the Roman Catholic Church, held on the 14th September. See CROSS.

EXAMINATIONS are of various kinds, according to the objects in view in conducting them,—such as tuitional, competitive, testing. Of these, the first forms a necessary part of every scheme of education; the second is applied to determine the relative merits and attainments of students; the third, to ascertain whether their acquirements are up to a fixed standard, so as to entitle them to certain degrees, or to fill certain situations. Each of these again may be conducted in several ways; 1. Orally; 2. By written exercises done under inspection in a set time; 3. By original compositions written leisurely at home; 4. By disputations; 5. By a combination of the preceding methods. It is proposed in this article briefly to consider each of these kinds of examinations, to discuss the advantages of the different methods of conducting them, the kind of merit and ability which they are qualified to detect, and their value as tests of men so far as concerns their qualifications for practical life.

1. *Tuitional Examinations.*—A system of tuition necessarily involves a system of examination. The object of a teacher being in general to impart to his pupils a knowledge of facts and principles, with the view of storing their minds and developing their faculties, he must take constant pains to ascertain whether these have been clearly apprehended, which he can do no otherwise than by obliging his pupils to reproduce and apply them. In this reproduction a new set of the pupil's faculties are brought into exercise, and the training which his mind receives in examination is seen to be no less important than the acquisition of knowledge itself. Thus, examinations are in a twofold sense necessary accessories to prelections,—the practical and productive fa-

culties being exercised by the former, as the receptive are by the latter. Hence, some of the peculiar advantages of the catechetical teaching still pursued in one or two of our universities, which blends the lecture and examination after the Socratic method. It will be seen that all the methods of examination are applicable to, and necessary for, the purposes of this kind of examination.

2. *Competitive Examinations.*—Though examinations may be presumed to have been purely tuitional in their origin, their power to call out the emulation of the pupils, and to spur them to diligence in their studies, cannot have been long undiscovered. Thus, examinations which were first the teacher's means of gauging the minds of his pupils, so as to satisfy himself of the success or failure of his instructions, soon passed into competitive struggles for honours and prizes, as rewards of merit, and stimulants to industry. The emulation thus educed gives a teacher a most powerful means of securing the mental progress of his pupils,—a means at the same time which should be used with caution, inasmuch as it is better to foster a love of learning for its own sake, than a desire for it as a means of triumph. Too often the desire for superiority becomes secondary in competitive struggles to the desire of winning the prizes. This is the case to a considerable extent in the English universities, and especially in Cambridge, where the primary design of competitive examinations is to some extent thwarted, in consequence of the discouragement to the cultivation of specialties arising from the requirements for the final examination. However much it is to be regretted, it naturally results from the number and value of the prizes awarded to success, that not a few among the candidates for honours in the English universities regard their time, and labour, and the cost of their tuition as an investment, towards securing their position in life, rather than as a contribution to their mental capital. Besides the exhibitions, scholarships, and fellowships which may now be won by competition at our schools and universities, a new class of prizes has lately been opened to successful competition, viz., appointments in the India civil service; and it is highly probable that the vacancies in the home civil service will ere long be supplied by a similar process. The result of rendering the competitive examination system universal cannot at present be safely speculated upon. The Chinese empire, in which the prizes of literary success have for ages been office, wealth, and power, affords an extreme example, which is far from favourable. It seems as if success in science and literature were reserved for those only who follow them with a generous love, for the pleasures and satisfaction they are capable of affording, and as if nature refused to unlock her secrets to any but those who come to her animated with a simple love of truth,—desiring to know her for her own sake, and not for their personal advantage. But whatever may be the ultimate effect of recent changes on the progress of learning and science, there is no doubt of their numerous advantages, meanwhile, in opening up to the aspiring youth of the humbler classes avenues by which to ascend to a better condition; and at the same time in securing for the public service a class of men on the whole better than it has hitherto obtained.

Testing or Pass Examinations.—These are examinations to determine whether candidates are worthy of admission to a college or university, or to offices to which they have been nominated, or to be promoted from one class to another in schools and universities, or to determine their title to degrees—that is to a public recognition of their having creditably completed a certain course of study. These examinations are usually conducted with much less rigour than the competitive, and in many cases are a mere mockery. Besides these more properly scholastic examinations, all the professions are fenced by tests more or less real, which propose to determine whether the candidates for admission to them possess the minimum amount of knowledge and ability necessary for maintaining the honour and credit of the profession, and for practising in it with safety and benefit to the public.

In addition to the testing or pass examinations to which we are accustomed in our own country, there are others of more universal application in use in various foreign states, which require by law that their subjects should be able to read and spell their mother tongue correctly, to write accurately from dictation, and to know the first three or four rules of arithmetic, and a certain amount of geography, before they are allowed to accept responsible employment of any kind. In Denmark this is called the "Confirmation" examination, and a certificate of having passed it must be presented before even a private employer can engage a servant into permanent occupation. In Germany it is called the "Maturity" examination. Some efforts have been made of late to introduce a similar examination in this country, but the genius of our people seems to be opposed to any such innovation.

Oral Examinations.—Examination *vivâ voce*, in itself the most natural and direct method, in cases where it is admissible, seems of all the methods of examination to be the most satisfactory; and there is little doubt that no examination can be quite satisfactory which is not partly oral. In *vivâ voce* examinations there can be no concealment or deception; where knowledge is clear and matured in the mind of the candidate it cannot fail to appear, and where it is hazy, crude, and glimmering, it cannot fail to be detected. The numberless subterfuges with which ignorance may be cloaked in a written exercise, so as to leave the examiner in doubt, are here unavailing. The crammed man stands at once exposed. "A shot," to use the university phrase, is seen to be "a shot" the moment it is made; and an examiner—himself master of his subject—can rarely fail in a few minutes conversation to detect the height and depth of the candidate's knowledge. Of course, oral examination is impossible in all cases, and recourse must be had to written exercises wherever time and deliberation are required on the part either of the candidate in producing his answers, or of the examiner in forming his judgment—as where it is desired to test the candidate's power of applying principles, his ingenuity in solving problems, his appreciation of the beauties and niceties of language, or powers of composition. But oral examinations are liable to this objection, that they make the candidates nervous, and temporarily incapacitate them for the free use of their knowledge and faculties. This however might be obviated if examinations were always conducted in a courteous and affable manner.

At the English universities examination *vivâ voce* is conjoined with examination by written papers in all but the principal degree examinations, and forms part of all the examinations at the chief colleges. The previous (pass) examination, at both Oxford and Cambridge, is partly oral; and in the recent publication of "Papers relating to the Reorganization of the Civil Service," it will be seen that nearly all who were consulted recommend a *vivâ voce* examination as part of the scheme, and that the reporters have adopted this recommendation. In fact, it is commonly agreed by those best able to form an opinion, that if the choice lay between an examination altogether *vivâ voce* or altogether by written papers, the former should be preferred.

In the last report of the university commissioners for Cambridge, the recommendation of several of the professors and private tutors, that a *vivâ voce* examination should form part of the examination for honours, has been adopted, and a change may soon be expected in accordance with it.

Written Examinations.—The best system of written examinations hitherto devised and put in practice in this country is to be found in the English universities. The

Examinations.

greatness of the prizes in these institutions, and the number of the competitors for them, have long forced the attention of the university authorities to the subject of examinations, and to the best means of securing an impartial and correct classification of the candidates for honours; and, on the whole, though the system is not without drawbacks, it may be said to work satisfactorily. An account of the examination of candidates for mathematical honours at Cambridge will suffice for a general account of written examinations, with all their merits and defects. Every year there are appointed two examiners for the business of examination. These examiners are joined to two moderators, who are usually elected for two years, and the four together form a board of examiners for mathematical honours, the duties being divided among them. The number of subjects professed by first-class men may be set down at twenty-five, and on these there are set in all sixteen papers, about three-fourths of which are on what is called "book-work"—or the principles of the sciences, and the remainder on their application; and of late it has been usual to accompany every piece of book-work by a "rider," or simple problem or theorem, the solution or proof of which will test the candidate's apprehension of the principle and his ingenuity, enabling the examiners to discern whether his judgment as well as his memory has been exercised in his reading. The problems are always "made up" for the occasion, and are of all shades of difficulty. To each question, rider, and problem, a number of marks are assigned, according to an average agreed upon by the examiners, and a specified time, generally from two to three hours, is allowed for each paper. He is held to have done best in the examination who has won most marks in the time, and, after him, the rest are classed in the order of their marks. The examination may be said to be on the whole a fair test of mental quickness, of memory, clearness of apprehension, judgment in seizing on the point of a question, and rapidity in penmanship;—in fact, it may be said to test intellectual agility and clear-headedness directly, while indirectly it tests to a degree the powers of application, and the carefulness of students in their studies, and thus, in some measure, both their habits of life and thought. It may be conceived that success in such a struggle must be the triumph of dogged perseverance, united to genuine ability; and this is the case to a considerable extent. In such a competition there is, however, a chapter of accidents of no mean length, and many features more or less repulsive to the best class of minds. Not unfrequently the health and nerves of candidates affect their position in the lists, and they lose in a day the advantage of years. Besides this, the crotchets of the examiners (though by submitting their papers to one another these are to a degree removed) are always more or less marked; and it occasionally happens that *all* the subjects are not done equal or due justice to, and that thus a candidate is deprived of a fair chance, while, at other times, the accidents of the examination place a man far above his true place. Besides these drawbacks, there are others connected with the manner in which the subjects must be "got up" for the contest, and to which the best minds are painfully sensitive. Many things *must* be crammed into the mind which are destined in the nature of them to drop out of it, and which never should have been committed to it; and by this necessity a good man feels more or less degraded. On the whole, however, and these drawbacks notwithstanding, the man of talent who lays himself out to excel in this competition rarely fails in it, at whatever cost to his feelings or damage to his mind. In proof of this, appeal may be made to the university calendar, from which it will appear that for one junior soph who distinguishes himself in after-life, at least twenty wranglers rise to eminence.

The great objection to examinations conducted as above described is, that the candidates are forced to send up answers to questions and solutions to problems written off in great haste, and that they give no chance to that valuable order of mind—the "slow but sure;" the other general objection has already been stated, that by forcing all reading and thought on the part of the candidates to turn towards production in examination papers, it cramps their minds and makes their studies ungenerous. In at least one of the Scotch universities, and in several classes at the rest of them, it is usual to allow an unlimited time for the writing of the papers; but this, while obviating the objection against the haste and flurry of the English system, has a drawback in the absence or laxity of the inspection. The natural supplement to the written examinations in the English universities is the *vivâ voce* and the Essay, which is now to be considered.

Essays.—When the honour of candidates can be relied on, or when, by the other methods of examination, such an approximation to the ability of a candidate has been obtained as may form a check against his practising deception, essays on prescribed subjects done leisurely at home afford a good supplementary test of ability, giving every man a chance of appearing to the best advantage, and obviating alike the hurry of written and the chill of ill-conducted *vivâ voce* examinations.

Disputations.—This method of examination, in which competitors were matched against each other in cross-examination and argument, is now gone into disuse in this country. It still forms a feature in the *Concours* in France, in connection with which it will hereafter be referred to. Its value as an element in an examination affecting to be thorough will be shown in the same connection.

Mixed Examinations.—From what has already been said, it may be gathered that the preceding methods should be conjoined in every examination which aims at a just and impartial classification of candidates according to their real merits and acquirements. That we have in this country no examination even pretending to combine these methods is a matter of reproach, intellectual competitions being so common among us. In the absence of any instance of the mixed examination among ourselves, the combination must be illustrated by an example borrowed from France—viz., the *Concours*—for the admission of members to the medical profession. The *Concours* consists of an assembly of all the members of the medical faculty who can be brought together in the district. Besides these there are the candidates, who, on the occasions of the elections of *élèves internes*, usually number between 100 and 200; and the examination is conducted before a public audience consisting commonly of several hundred persons. The first business is the appointment by ballot of a jury of five of the medical practitioners. A number of skilfully framed and comprehensive questions are then put in a vase, whence one at a time is drawn out by a public officer and given to each of the sets of candidates as they pass in turn to private rooms, where they are kept under inspection. Each set is allowed eight minutes to frame verbal answers to the question which falls to its lot, at the end of which time they return and make their answers before the public. At this stage each candidate is at liberty to question his competitor—cross-examination resulting, which in contests for the higher offices often lead to finished and instructive displays of science and skill. Besides these questions for verbal answers, others of a higher order are put to the sets, to which written answers are required within two hours, the answers being framed as in the former case under inspection. These are delivered sealed, are opened and read by the examiners before the public, and are then submitted for the decision of the jury. The examination is thus continued from day to day, sometimes over a fortnight, till the candidates are thoroughly sifted and the *élite* of them discerned.

Here then are combined the best possible security against partiality on the part of the judges, and the best guarantee that if a man's merits are not detected it must be from some radical defect in himself which mars his better qualities; the *vivâ voce*, the written exercise, and the disputation being here practically combined, before an impartially chosen tribunal.

This account of the *Concours* naturally leads to a consideration of the practical difficulties encountered in competitive examinations in general. These are connected, 1*st*, with the appointment of examiners; 2*d*, with the affixing of marks to the questions, and the adjudging what proportion of the full marks the answers sent up merit. With regard to the first it may be set down as a rule, that in a college or university the prelector should not be the examiner of his own class, and that in any case the same examiner should not be employed on more than one or two occasions. In colleges where professors act as the examiners for their own classes, and in the case of examining boards such as that of the London university—which is virtually a permanent body—students soon discover what questions are considered crucial by the examiners, their crotchets become familiar, and the examination tends to degenerate into a mere test of cramming. The system followed at Oxford and Cambridge, whereby fresh men are annually brought to the task of examination, seems to be the only one in this country free from objection. The permanency of the board of examiners for the India Civil Service is the worst feature in the scheme of reform, and may (acting conjointly with a similiar board for the Home Civil Service) have a very prejudicial effect on the progress of education. Where those who are to decide upon the merits of candidates are previously known, and hold their office permanently, it becomes the interest of the candidate to ascertain their opinions and crochets; and, as a matter of course, he directs his studies to their specialties and standard, rather than to the latest state of scientific information, which, in professional matters especially, is too frequently not the state most favoured by the examiners. And that this is the case may be inferred from the fact that a body of crammers is always to be found drilling men successfully for examination by all such permanent examiners, whose habitual routine of questions they make a business of ascertaining, preparing their pupils to answer them and them only. Whereas, when the examiners are varied from year to year, as at the English universities and in the French *Concours*, a candidate can only expect to win his way by sedulous attention to the entire course of his study, and by availing himself of every opportunity of gaining the latest and best authenticated information on the subjects allied to it. The difficulty connected with the appointment of examiners will be seen to be one of expense; and if the weight of the objections to the present arrangement in our Scotch universities, as well as to the proposed permanent boards for the civil services, were duly appreciated, there is no reason why they should not at once be removed. Regarding the difficulty connected with the affixation of marks to the papers of the respective candidates, there appears to be no remedy; merit must remain, within certain limits, a matter of opinion. It is plain that short of omniscience on the part of the examiners, the distribution and affixation of marks cannot be accomplished with any great degree of accuracy, and all that can be expected is, that the examiners being honourable men, will take due care in the performance of their task, and satisfy their own judgments and consciences that they have to their best ability faithfully discharged it.

The growing importance which is being attached to examinations in literary and scientific subjects as tests of qualifications for practical life, makes it necessary that a few words be said here on their value as tests of such qualifications. It will be admitted by all who have had to do extensively with examinations and the education of youth, that, however useful examinations may be in ascertaining the special *acquirements* of men, they are nowise certain to detect the man of real talent, endowed with practical good sense, and with ability to conduct himself with propriety and decision under new and unexpected combinations of circumstances. At the age when examinations are entered into, it often happens that a man fails because his intellect has not fully developed itself, and as often that a sickly precocity bears off the palm. Not unfrequently, too, men win prizes at competitive examinations who have, under the influence of a strong hope or fear, laboured hard at their studies, and who, the moment the motives which urged them to exertion are removed, collapse into spiritless indolence—a case of common occurrence in the English universities; while, on the other hand, a man of sturdy fixed principle, being, it may be, above the considerations which actuated his contemporaries, passes into life in possession of healthy and not overtaxed faculties, finding in practical affairs motives to exertion which he failed to find in the world of scholarly ideas. Besides, unless a man has been previously tried in practical life, an examination will not ascertain, or will only ascertain imperfectly, the qualifications of industry, punctuality, correctness in the transaction of business, steadiness or reliability, or the power of fixing the attention immediately and steadily on new work. But these are the very qualities necessary for success in practical life. And as these observations are made with special reference to the proposed reforms in the civil service, the experience of that service in past times may be quoted in proof of the preceding view. In this service it has been found, that even first-class men from Oxford and Cambridge have proved failures in as large proportion of instances as any others, —the failures arising both from unsuitable qualifications, and from holding themselves above the valuable steady labour, called "drudgery," required in subordinate appointments, and above applying zealously such general qualifications as they may possess. This experience raises an objection to every scheme for the appointment of public servants which proposes to apply to them academic tests alone. If at present learning, science, and scholarly accomplishments have little or no weight in determining appointments, the practical qualities which directly fit a man for the business of life are in danger of being overlooked under the new system. This danger is heightened by the consideration, that the best men, who are generally ambitious, are not likely to offer themselves as candidates for such meagre appointments as those of the subordinate offices in the civil service (where the prospect of rapid promotion is so very small), but will prefer the more open, though more hazardous, competitions of professional life; and thus the choice for the civil service may lie between the men of middle-rate intellect, as displayed in academic pursuits, and the men of "unadorned" business talent, over whom, however, the mediocre class of scholars are sure to be preferred in the academic contest. The loss to the service may thus prove to be greater than the gain contemplated in the proposed "improvement." And while it is easy to run up a long list of eminent scholars, who, after leaving the schools and universities, distinguished themselves in public life,—such as Hastings, Metcalfe, Wellesley, Law, Ellenborough, Mansfield, Eldon, Stowell, Gibbs, Tindal, Tenterden, Lyndhurst, and a host of others of recent date, or who are still famous; it must not be forgotten, that if the entrance to public life had always been guarded by academic tests, more than one lord chancellor and chief justice who rose from being attorneys' clerks, would have been excluded from the service of their country, which would also have lost many others of its most famous men by the same means. The present commander-in-chief began his military career when about twelve years of age; and the late Duke of Wellington used to declare, that an academical education would have ex-

cluded him from the army, as it certainly would have excluded Nelson from the navy. It is useless, however, to balance names in such an argument; it is sufficient to appeal to the reader's own experience, whether he has not known cases of success from small and rough beginnings, numerous enough to convince him that scholarly accomplishments have little to do with qualifying a man for practical affairs. More than one instance might here be cited of engineers who commenced their professional lives with wheelbarrows in hand, overcoming difficulties before the close of their careers which academies of science had declared to be insuperable. There is little doubt that men of this class, if educated in academic fashion, would have distinguished themselves in intellectual competitions. But the question is, what countervailing advantage would they have derived from having been put to these studies, at the expense of several years spent at a university, instead of being engaged during that period in the practical work of life. The balance is to be struck between the advantages, so far as regards eventual efficiency, of four or five years spent at a university in the cultivation of accomplishments, and the same number spent in actual practice in the world. The advantage of scholarship and scientific knowledge to a man himself, must be wholly left out of this consideration; and when this is done, it will be found extremely difficult to come to a decision, considering how often eminence in that which is of little practical use is found to have been attained to the exclusion of that which is practically the most needed. Indeed, the popular prejudice against scholars and men of science, as regards their fitness for business, is not altogether without foundation; and many instances might be quoted to show, that a minute knowledge of the niceties of language, and habits of reasoning accurately *from* abstractions *to* abstractions, are far from being the best guarantees of practical ability. Mr Laing remarks, that the manner in which the French and German philosophers conducted the great public interests and affairs entrusted to them in 1848, "shows that the mind formed in literary pursuits is not the best prepared to deal with men and realities in social economy or in affairs of state. It is not a matter of course that the eminent literary man, philosopher, professor, or author, must be a good minister of state, or a great financier, or even a man of practical views, unshaken steadiness, and of reliability and political honesty. The history of Germany, and France since 1848, has not raised the character of literary men in the field of politics, or proved that they are not in their right places in their libraries and class-rooms."—(*Observations on the Social and Political State of Denmark, &c.*, 1852.)

These considerations indicate the necessity for devising a test of qualifications more thorough than has yet been invented. It is abundantly clear, that the academic test should not be held sufficient of itself; and it appears that a modification of the plan at present proposed for the election of civil servants should be made, and that a moderate academic test should be applied to the candidates *at an early age*, a term of probation being fixed between the nomination subsequent to the examination, and the final confirmation of the appointment. (J. F. M'L.)

EXARCH (ἔξαρχος, *a chief person or leader*), a title that has been conferred at different periods on certain chief officers or governors, both in secular and ecclesiastical matters. Of these, the most important were the exarchs of Ravenna. The first of these was appointed by Justinian, emperor of the East, as governor of the middle part of Italy, which was made a province of the Eastern empire after Narses had entirely subdued the Goths and their allies in Italy, A.D. 552–554. Ravenna, with the whole exarchate, was conquered by Astolphus, king of the Lombards, in the year 752; but three years later it was taken by Pepin, king of the Franks, who bestowed it on the pope (Stephen III.),—since which time Ravenna and its territory have remained united to the papal dominions.

Exarch of a Diocese was, anciently, the same with primate. This dignity was intermediate between the patriarchal and the metropolitan. *Exarch* is also used, in the ecclesiastical antiquities of the Eastern Church, for a general or superior over several monasteries.

In the modern Greek Church, an exarch is a deputy or legate *a latere* of the patriarch, whose office it is to visit the clergy and churches in the provinces allotted him. The power which the exarch enjoys, and the uses to which he turns it, recall the times of the corrupt proconsulars of the Roman empire. He usually enriches himself greatly in his post, and frequently rises to the patriarchate itself.

EXAUCTORITAS, in the ancient Roman military discipline, denoted a partial discharge from service, granted to those soldiers who had served in the legion for sixteen years, and who were thus said to become *exauctorati*, though they continued, under a *vexillum* or standard of their own, in company with that legion, until they had completed their full term of service, namely, twenty years, after which they received the *missio* or full discharge. After the Augustan period, the term *exauctorare* was used to signify a simple discharge, and also to denote a cashiering on account of misconduct—in which last sense alone it was employed during the period of the decline.

EXCAMBION, from the Italian *Cambio, exchange*, is the name given, in Scots law, to the contract by which one piece of land is exchanged for another. The deeds by which this contract is completed, must expressly bear that the lands are mutually given in excambion. In such deeds a real warrandice of the lands excambed is implied, so that in the case of eviction of either party from the land which he has received in excambion, he may recover possession of that which he gave in exchange. This warrandice holds good not only with the contracting parties but also with their heirs and singular successors. This species of contract is resorted to for straightening the marches of contiguous lands.

EX CATHEDRA, a Latin phrase, originally applied to the dictates or decisions of prelates, chiefly popes, delivered in their pontifical capacity. Hence, in common language, it is applied to any decision or order given with an air of official authority.

EXCELLENCY, as a title of honour, was anciently given to kings and emperors. Charlemagne, for instance, was sometimes thus styled. The title was likewise accorded to the Venetian senate; and in earlier times to the exarchs, &c. It is now restricted, for the most part, to ambassadors and commanders-in-chief. The governors of some provinces are also styled *excellency* if they have no other title; but if they be peers or right honourable, they take the honorary title belonging to their position. In the United States of America, the president, the ministers plenipotentiary to foreign countries, and the governors of states, all claim the title of *excellency*.

EXCENTRIC, deviating from the centre; not having the same centre. The term is applied in geometry to circles and spheres which have not the same centre, and consequently are not parallel; in opposition to concentric, where one surrounds the other ring-wise.

EXCENTRICITY, in *Astronomy*, the distance of the centre of the orbit of a planet from the centre of the sun; that is, the distance between the centre and the focus of the ellipse in which the planet moves.

EXCHANGE.

Exchange.

In commercial economy the term "Exchange" is commonly employed to designate that description of mercantile transactions, by which the debts of individuals residing at a distance from each other are liquidated, without the intervention of money. The object of this article is to explain the nature of these transactions, and the principles on which they depend.

This will be best effected by treating, *first*, of the exchange between different parts of the same country; and, *secondly*, of that between different and independent countries.

Inland exchange.

Inland Exchange.—Suppose a merchant of London orders his agent in Glasgow to send him a thousand pounds' worth of cottons, and that it does not suit the agent to commission goods of equal value from his London correspondent, the latter may, notwithstanding, be under no necessity of remitting cash to Glasgow in discharge of his debt. Among countries or cities having a considerable intercourse together, the debts mutually due by each other are found, in ordinary cases, to be nearly equal. The Glasgow agent, who has shipped the cottons for London, does not, therefore, transmit the bill drawn by him on his correspondent for their price to London to be cashed, as that would subject him to the expense of conveying the money home to Glasgow; but he gets its value from some other party in Glasgow, who has a payment to make in London on account of tea or some other article bought in that city, and who, unless he could procure such a bill, would be obliged to remit its price in money. The bill on account of the cottons is, therefore, either drawn in favour of the party in London who furnished the tea, or it is drawn in favour of the tea-dealer in Glasgow, and indorsed by him to the former, who, on presenting it to the purchaser of the cottons, receives its value, and consequently the price of the cottons, and the price (or part of the price) of his tea, at the same moment. This simple contrivance obviates the expense and risk attending the transmission, first, of money from London to Glasgow to pay the cottons, and, second, of money from Glasgow to London to pay the tea. The debtor in one is changed for the debtor in the other; and both accounts are settled without the intervention of a single farthing.

The bill drawn and negotiated in such a transaction as this is termed an *inland* bill of exchange. If the transaction had taken place between London or Glasgow and a *foreign* city, it would have been termed a *foreign* bill of exchange.

A bill of exchange may, therefore, be defined to be, "an order addressed to some person residing at a distance, directing him to pay a certain specified sum to the person in whose favour the bill is drawn, or his order."[1]

The price of bills fluctuates according to their abundance or scarcity compared with the demand. If the debts reciprocally due by London and Glasgow be equal, whether they amount to L.100,000, L.500,000, or any other sum, they may be discharged without the intervention of money, and the price of bills of exchange will be at PAR; that is, a sum of L.100 or L.1000 in Glasgow will purchase a bill for L.100 or L.1000 payable in London, and *vice versa*. But if these cities be not mutually indebted in equal sums, then the price of bills will be increased in the city which has the greatest number of payments to make, and reduced in that which has the fewest. If Glasgow owe London L.100,000, whilst the latter only owes the former L.90,000, it is clear, inasmuch as Glasgow has a larger sum to remit to London than London has to remit to Glasgow, that the price of bills on London will rise in Glasgow because of the increased demand, and that the price of bills on Glasgow will fall in London because of the diminished demand. A larger sum would consequently be required to discharge a debt due by Glasgow to London, and a less sum to discharge an equal debt due by the latter to the former; or, which is the same thing, the exchange would be in *favour* of London, and *against* Glasgow. Bills on London would sell in Glasgow at a *premium*, and bills on Glasgow would sell in London at a *discount;* the premium in the one case being equal to the discount in the other.

On the supposition that the balance of L.10,000, due by Glasgow, depresses the exchange on London *one per cent.*, it appears, at first sight, that it will cost Glasgow L.101,000 to discharge her debt of L.100,000 due to London; and that, on the other hand, L.89,100 would be sufficient to discharge the debt of London to Glasgow. But a very little consideration will serve to show that this would not be the case. Exchange transactions cannot take place between different cities until debtors and creditors of the one reside in the other. And hence, when the exchange became unfavourable to Glasgow, the premium paid by its merchants for bills on London would not go into the pockets of their creditors in the latter, but into those of their neighbours in Glasgow to whom London was indebted, and from whom the bills were purchased. The loss to Glasgow would, therefore, be limited to the *premium* paid on the balance of L.10,000. Thus, supposing that A of Glasgow owes D of London L.100,000, and that C of London owes B of Glasgow L.90,000; A will pay to B L.91,000 for a bill or order on C to pay D L.90,000. In this way the L.90,000 of London debt at Glasgow would be cleared off; the premium, which is lost by the debtor to London in Glasgow, being gained by its creditor in the same place. If the business had been transacted in London, C, with L.89,100, would have purchased of D a bill for L.90,000, payable by A; so that, in this case, the gain would have fallen to the share of the debtor C, and the loss to that of the creditor D, both of London. The complexity of real transactions does not affect the principles on which they are founded. And whatever may be the amount of the debts reciprocally due by different places, the only disadvantage under which any of them could be placed by a fall of the exchange would be the unavoidable one of paying the expense of remitting the *balance* of debt.

The expense of transmitting money from one place to another limits the fluctuations in the exchange between them. If 20s. sufficed to cover the expense and risk attending the transmission of L.100 from Glasgow to London, it would be indifferent to a merchant, in the event of the exchange becoming unfavourable to the former, whether he paid one per cent. *premium* for a bill on London, or remitted money direct to the latter. If the premium were less than one per cent., it would be clearly his interest to make his payments by means of bills rather than by remittances; and that it could not exceed one per cent. is obvious, for every

[1] In mercantile phraseology, the person who draws a bill is termed the *drawer;* the person in whose favour it is drawn, the *remitter;* the person on whom it is drawn, the *drawee*, and after he has accepted, the *acceptor*. Those persons into whose hands the bill may pass previously to its being paid, are, from their writing their names on the back, termed *indorsers;* and the person in whose possession the bill is at any given period, is termed the *holder* or *possessor*.

individual would rather directly remit money than incur an unnecessary expense by purchasing bills on London at a greater *premium* than would suffice to cover the expense of a money remittance. If, owing to the badness of roads, disturbances in the country, or any other cause, the expense of remitting money from Glasgow to London were increased, the difference in the rate of exchange between them might also be proportionally increased. But in every case the extent to which this difference could attain would be limited by, and could not for any considerable period exceed, the cost of remitting cash.

Exchange transactions become more complex when one place, as is often the case, discharges its debts to another by means of bills drawn on a third place. Thus, though London should owe nothing to Glasgow, yet if Glasgow be indebted to London, London to Manchester, and Manchester to Glasgow, the latter may wholly or partially discharge her debt to London by remitting bills on Manchester. She may wholly discharge it, provided the debt due to her by Manchester exceed or is equal to the debt due by her to London. If, however, it be not equal to the latter, Glasgow will either have to remit money to London to pay the balance of debt, or bills on some other place indebted to her.

Transactions in inland bills of exchange are almost entirely conducted by bankers, who charge a certain rate per cent. for their trouble, and who, by means of their credit and connections, are able, on all occasions, to supply the demands of their customers. London, because of its extensive correspondence with other parts of the country, occasioned partly by its immense commerce, partly by its being the seat of government and the place to which the revenue is remitted, and partly by its currency consisting of Bank of England paper, for which the notes of the country banks are rendered exchangeable, has become the grand focus in which the money transactions of the United Kingdom centre, and in which they are all ultimately adjusted. These circumstances, but especially the demand for bills on London to remit revenue, and the superior value of Bank of England paper, render the exchange between London and other parts of the country invariably in her favour. Bills on London drawn in Edinburgh and Glasgow were formerly made payable at forty days' date, which was equivalent to a *premium* of about $\frac{1}{2}$ per cent; but, owing to the greater facility of communication, this *premium* is now reduced to twenty days' interest, or to about $\frac{1}{4}$ per cent. Bills for remitting the revenue from Scotland are now drawn at thirty days; previously to 1819 they were drawn at sixty days.

These statements are sufficient to show that, how well soever bills of exchange may be fitted for facilitating the operations of commerce, and saving the trouble and expense attending the transportation of money, mercantile transactions cannot be adjusted by their means except in so far as they mutually balance each other. A *real* bill of exchange is merely an order entitling the holder to receive payment of a debt due by the person on whom it is drawn. It is essential to the existence of such bill that an equivalent amount of debt should be contracted. And hence, as the amount of the real bills of exchange drawn on any number of merchants cannot exceed the amount of their debts, if a greater sum be owing by them than they owe to others, the balance must either be paid in money or by the delivery of some sort of commodities. If, as in the case referred to, Glasgow owe London L.100,000, while London only owes Glasgow L.90,000, a reciprocal transfer of debts may be made to the extent of L.90,000. But the Glasgow merchants cannot discharge the additional L.10,000 by means of bills on London; for, by the supposition, London only owed them L.90,000, and they have drawn for its amount. This balance must therefore be discharged by an actual money payment, or by the delivery of some species of produce, or by bills on some third party indebted to Glasgow.

It is not meant by this to insinuate that *fictitious* bills of exchange, or bills drawn on persons who are not really indebted to the drawer, are either unknown or very rare. In commercial countries bills of this description are always to be met with; but they are a device for obtaining loans, and cannot transfer real debts. A of London may form a connection with B of Glasgow, and draw bills upon him payable a certain number of days after date, which the latter may retire by selling bills upon A. The merchants who purchase, or the bankers who discount these bills, advance their value to the drawers, who, by means of this system of *drawing* and *redrawing*, command a borrowed capital equal to the amount of the fictitious paper in circulation. It is clear, however, that the negotiation of such bills cannot assist in transferring and settling the *bona fide* debts of two or more places. Fictitious bills mutually balance each other. Those drawn by London on Glasgow equal those drawn by Glasgow on London, for the one set is drawn to pay the other—the second destroys the first, and the result is nothing.

The raising of money by means of fictitious bills has been severely censured by Adam Smith, who says it entails a ruinous expense on those engaged in it, and is resorted to only by projectors, or persons of suspicious credit. When fictitious bills are drawn at two months' date, it is common to charge, in addition to the ordinary interest, a commission of half or quarter per cent., which must be paid every time the bill is discounted, or, at least, *six* times a-year. The total expense of money raised in this way could not, therefore, supposing the transaction to be always on account of the same individual, and interest 4 per cent., be estimated at less than $5\frac{1}{2}$ or 7 per cent. per annum, *ex* stamps; and the payment of so high an interest on borrowed capital, in a country where the ordinary rate of mercantile profit is not supposed to average more than from *six* to *eight* per cent., could not fail to be frequently productive of ruin to the borrower. But it seldom happens that, in the negotiation of fictitious bills, the charge for commission falls on one individual only. Loans obtained in this way are usually on account of two or more parties. At one time a fictitious bill is drawn by A of London on B of Glasgow; and, in this case, the latter will, before the bill becomes due, draw upon A for its amount, including interest and commission. At another time, the transaction will be on account of B, who in that case has to pay commission to his friend in London; so that each party may, on the whole, as Mr Thornton has observed, gain about as much as he pays in the shape of commission.

It is often extremely difficult to distinguish fictitious bills from those which have arisen out of real transactions. Neither does it seem to be of any very material importance. The character and credit of the parties whose names are attached to bills, are the only criteria by which merchants or bankers can judge whether they ought to negotiate them. The circumstance of an individual offering accommodation paper for discount, ought unquestionably, if it be known, to excite suspicions of his credit. But unless in so far as the drawing of fictitious bills may be held to be indicative of overtrading, or of a deficiency of capital to carry on the business in which the party is engaged, there does not appear to be any very good reason for refusing to discount them.

Within the last few years, it has been the practice to grant money orders, payable on presentation at the different post-offices, for sums of L.5 and under. These orders cost 3d. for sums of L.2 and under, and 6d. for sums between L.2 and L.5 inclusive; and as they are not paid unless the parties in whose favour they are drawn, or other parties well known to the postmasters by whom they are payable,

Exchange.

appear to receive payment, there is no risk of the money getting into improper hands. This system has been found to be a very great accommodation to the public, especially to those having small sums to remit, and has been very extensively resorted to. In 1850, 4,439,713 money orders were issued in the United Kingdom; the aggregate sum transferred by their agency being L.8,494,498, 10s. 7d.

These observations will, perhaps, suffice to explain the manner in which transactions between different parts of the same country are settled by means of bills of exchange. They are, in general, extremely simple. The uniform value of the currency of a single country renders unnecessary any comparison between the value of money at the place where the bill is drawn and negotiated, with its value where it is to be paid; while the constant intercourse maintained amongst different parts of the same kingdom, and the usual absence of those occurrences by which the intercourse between distant and independent countries is always subject to be interrupted, prevent those sudden fluctuations which frequently arise in the prices of foreign bills of exchange. We shall, therefore, leave this part of our subject, and proceed to investigate the circumstances which influence the course of exchange between different and independent countries.

Foreign exchange.

Foreign Exchange.—The price of foreign bills of exchange depends on two circumstances: *first*, On the value of the currency of the place where they are made payable, compared with the value of the currency of the place where they are drawn; and, *secondly*, On the relation which the supply of bills in the market bears to the demand.

If the value of the different coins and moneys which circulate in nations having dealings with each other were invariable, the exchange would be exclusively influenced by circumstances affecting the supply and demand for bills. But, in addition to variations in its cost in particular countries, the weight and fineness of the bullion contained in their coins are liable to all sorts of variations. And it is almost needless to say, that the price of bills, as of everything else, necessarily varies with these variations, increasing when the value of the money in which they are estimated falls, and falling when it increases. But these, it is plain, are merely nominal or numerical variations. They grow out of changes in the standard employed to measure values, and not in the values themselves. It is otherwise, however, with variations of price occasioned by changes in the supply of bills, or in the demand for them; that is, by changes in the payments a country has to make compared with those it has to receive. These are real, not nominal variations, for they affect the values in bills, and not the money in which these values are expressed. And hence the distinctions of *nominal, real,* and *computed* exchange. The *first* depends on alterations in the value of the currencies compared together; the *second* depends on the supply of bills in the market compared with the demand; and the *third*, or *computed* exchange, depends on the combined effects of the other two. For the sake of perspicuity we shall treat of these separately.[1]

Sect. I.—*Nominal Exchange.*

Bullion being everywhere recognised as the standard currency of the commercial world, the comparative value of the currencies of particular countries depends—1*st*, On the value of bullion in those countries; and, 2*dly*, On the *quantity* of bullion contained in their coins, or on the quantity of bullion for which their paper money, or other circulating media, will exchange.

Nominal exchange.

1. The value of freely produced commodities being commonly proportioned to the *cost* of their production, including therein the cost of their conveyance from where they have been produced to where they are to be made use of, it follows, were the trade in the precious metals perfectly open, and the commodities produced in different countries about equally well fitted for exportation, that the value of bullion in one, compared with its value in another, would be chiefly determined by their respective distances from the mines. Thus, on the supposition that neither England nor Poland had any article except corn to exchange with the Americans or Australians for bullion, it is evident that the precious metals would be more valuable in Poland than in England, because of the greater expense of sending so bulky a commodity as corn the more distant voyage, and also of the somewhat greater expense of conveying the gold to Poland. Had Poland succeeded in carrying her manufactures to a higher pitch of improvement than England, her merchants might be able, notwithstanding the disadvantage of distance, by exporting commodities possessed of great value in small bulk, the freight of which would be comparatively trifling, to buy bullion on cheaper terms than those of England. But when, as is actually the case, the advantages of skill and machinery are on the side of England, another reason is added to that derived from our less distance from the mines, why gold and silver should be less valuable here than in Poland, and why the money price of commodities should be higher.[2]

Hence, among nations which have attained to different degrees of excellence in manufacturing industry, the value of bullion does not wholly depend on their distance from the mines. But, whatever variations a different progress in the arts may occasion in its value in different countries, it is always less valuable in those into which it is imported, than in those in which it is produced. Like everything else, it is exported to find, not to destroy, its level. And unless its value in Europe exceeded its value in America and Australia by a sum sufficient to cover the expense of its importation, including ordinary profits to the importers, we should not, though the mines in these quarters were infinitely more productive, import from them a single ounce of bullion in the ordinary course of trade. It is obviously incorrect, therefore, to lay it down as a general proposition, "that the par of exchange between two countries is that sum of the currency of either of the two, which, in point of intrinsic worth, is precisely equal to a given sum of the other; *that is, contains precisely an equal weight of gold and silver of the same fineness.*"[3] For a given quantity of gold and silver is not always, as is here assumed, of the same intrinsic value in different countries. It may differ but little among nations bordering upon or near each other, and which are all destitute of mines. But though, to use a familiar illustration, the value of sugar approaches nearly to a level in the great trading cities of Europe, it cannot surely be maintained that its value in the West Indies is as great as in Bordeaux or Liverpool, or that the exchange would be really at par, if a bill, which cost a hundred hogsheads of sugar in London, only brought a hundred in Jamaica. Now, in respect of principle, this is precisely the case with bullion. Though the values of gold and silver, compared with corn, labour, &c., may, and indeed must, vary very considerably among different nations, these variations are only the necessary result of their different progress in industry, and of the different quality of their cultivated lands, &c. Such differences of price are in the natural order of things; and bullion has not found its proper level till a quantity has been introduced into those countries which excel in manufactures, sufficient to raise the price of their

[1] Supposing every country to be in possession of its proper supply of bullion, the exchange may be said to be *nominally* affected by the amount of the difference between the market and mint price of bullion, and to be *really* affected by any deviation from par exceeding or falling short of that difference. [2] Ricardo, *Principles of Political Economy*, &c., first ed., p. 175. [3] *Bullion Report*, p. 22, 8vo ed.

Exchange. corn and labour. These variations have, therefore, no influence over the exchange. Notwithstanding this difference of price, an ounce of bullion in one country, owing to the facility of intercourse, is very near equivalent to an ounce of bullion in another; and, supposing the trade in the precious metals to be perfectly free, the exchange will be at true par when bills are negotiated on this footing. But when we compare the values of these metals in distant countries, especially in those where they are produced, with those into which they are imported, there are very considerable differences. Gold and silver, like iron, coal, tin, &c., are necessarily cheaper in countries possessed of extraordinarily productive mines, than in those possessed only of mines of a secondary degree of fertility, or where they have to be entirely brought from abroad. And the exchange between such places is not a true par, unless adequate allowance be made for this difference of value. Thus if, because of the expense of carriage, the value of bullion in Great Britain be 5 per cent. greater than in San Francisco, 100 ounces of pure gold in the latter would not be worth 100 ounces of pure gold in London, but 5 per cent. less; and the exchange would be at true par when bills for 105 ounces standard bullion, payable in San Francisco, sold in London for 100 ounces.

The different values of the precious metals in different countries do not depend alone on their respective distances from the mines, or on their greater or less progress in the arts. The opinion formerly so very prevalent, that gold and silver were the only real wealth, led most nations to fetter and restrain their exportation, and to adopt a variety of measures intended to facilitate their importation. But these, even when most vigorously enforced, were singularly ineffectual. The great value and small bulk of the precious metals rendered it not only advantageous, but comparatively easy, clandestinely to export them, whenever their relative value declined.

"When," says Adam Smith, "the quantity of gold and silver imported into any country exceeds the effectual demand, no vigilance of government can prevent their exportation. All the sanguinary laws of Spain and Portugal are not able to keep their gold and silver at home. The continual importations from Peru and Brazil exceed the effectual demand of those countries, and sink the price of those metals there below that in the neighbouring countries. If, on the contrary, in any particular country their quantity fell short of the effectual demand, so as to raise their price above that of the neighbouring countries, the government would have no occasion to take any pains to import them. If it were even to take the pains to prevent their importation, it would not be able to effectuate it. Those metals, when the Spartans had got wherewithal to purchase them, broke through all the barriers which the laws of Lycurgus opposed to their entrance into Lacedæmon. All the sanguinary laws of the customs are not able to prevent the importation of the teas of the Dutch and Gottenburg East India Companies, because somewhat cheaper than those of the British Company. A pound of tea, however, is about a hundred times the bulk of one of the highest prices, 16s., that is commonly paid for it in silver, and more than two thousand times the bulk of the same price in gold, and consequently just so many times more difficult to smuggle."[1]

But, though ineffectual to prevent their egress, the restrictions on the exportation of the precious metals have nevertheless contributed to occasion some slight variations in their value in different countries. The risk formerly incurred by the clandestine exporters of bullion from Spain, is supposed to have been equivalent to about two per cent.; or, which is the same thing, it is supposed that the restrictions maintained such an excess of gold and silver in that country as to sink them two per cent. below their value in countries having a free trade in bullion. In calculating the true par of exchange between different countries, circumstances of this kind must be taken into account. For, to whatever extent bullion in one country may be sunk below its value in those with which it maintains an intercourse, the nominal exchange will necessarily be unfavourable to that extent.[2] Exchange.

It consequently results, that whatever occasions a rise or fall of the value of the precious metals in one country affects to the same extent its nominal exchange with other countries. If more coin, or convertible paper, circulated in Great Britain, compared with the business it has to perform, than in other countries, its relative value would be proportionally less. Foreign bills would sell for a premium, the amount of which would measure the excess of the value of the precious metals in the foreign market, caused by their redundancy in the home market. And, on the other hand, in the event of our currency becoming relatively deficient, its value would be proportionally increased; bills drawn on foreign countries would sell at a discount, the amount of which would equal the excess of the value of our currency over that of other countries.

2. In estimating the quantities of bullion contained in the coins of different countries, a particular coin of one, such as the British pound sterling, is selected for a standard by which to compare the others, and the proportion between it and them, supposing them to be all of their standard weight and fineness, is ascertained by experiment. A par of exchange is thus established, or rather it is ascertained that a certain amount of the standard currency of one country contains as much gold or silver of the same fineness, as is contained in the coin or integer with which it has been compared. This relation, or *par*, as it is technically termed, is considered invariable; and allowance is made for subsequent variations in the coins of countries trading together, by rating the exchange at so much above or below par. In mercantile language, that country, by a comparison with one or other of whose coins the par of exchange has been established, is said to give the *certain* for the *uncertain*, and conversely. Thus, in the exchange between London and Paris, London and Hamburg, &c., London gives the *certain*, or the pound sterling, for an *uncertain* or variable number of francs, florins, &c. Hence, the higher the exchange between any two countries, the more is it in favour of that which gives the *certain;* and the lower, the more is it in favour of that which gives the *uncertain*.

Par of exchange.

On the supposition that 25 francs contain the same quantity of standard bullion as a pound sterling (25 fr. 57 cent. is about the exact par), and supposing also that the value of bullion is the same in both countries, the exchange between London and Paris will be at par when a bill drawn in the one on the other sells at that rate; that is, when a bill of exchange for 2500, or 25,000 francs, payable in Paris, sells in London for L.100 or L.1000, and *vice versa*. It is but seldom, however, that the coins of any country correspond exactly with their mint standard. Unless when newly issued, they are either more or less worn; and whenever this defect becomes sensible, an allowance corresponding to the difference between their actual value and their mint value is made in estimating "the sum of the existing currency of either of two countries which contains precisely the same quantity of bullion as is contained in a given sum of the other." Thus, if our pound sterling were so worn,

[1] *Wealth of Nations*, p. 190.

[2] All restraints on the exportation of the precious metals were abolished in Great Britain in 1819. Their effect for many years previously could notestimated at above one-fourth per cent.

Exchange.

clipped, or rubbed, as not to contain so much bullion as 25 fr., but 10 per cent. less, the exchange between London and Paris would be at real par when it was nominally 10 per cent. against London;[1] and if, on the other hand, the pound sterling were equal to its mint standard, while the franc was 10 per cent. less, it would be at par when it was nominally 10 per cent. against Paris and in favour of London. If the currencies of both countries were equally reduced below the standard of their respective mints, there would obviously be no variation of the par; but whenever the currency of countries trading together is unequally depreciated, the exchange is nominally in favour of that country whose currency is least, and nominally against that whose currency is most, depreciated.

It is almost unnecessary to refer to examples to show the practical operation of this principle; and we shall content ourselves with selecting the following, from an infinite number of equally conclusive instances.

Previously to the great recoinage in the reign of William III., silver being at the time legal tender, the exchange between England and Holland, calculated by the standard of their respective mints, was nominally twenty-five per cent. against England. Inasmuch, however, as English silver coins were then, owing to rubbing and clipping, depreciated more than twenty-five per cent. below their mint value, the real exchange was probably at the time in our favour. And the circumstance of the nominal exchange having become favourable to us as soon as the new coin was issued, tends to confirm this conjecture.[2]

The guinea was so much worn and degraded, previously to the gold recoinage in 1774, as to be from 2 to 3 per cent. under its standard weight. Inasmuch, however, as the coins then circulating in France were nearly of their standard weight and purity, the exchange between London and Paris was nominally from 2 to 3 per cent. against the former. We say *nominally*, for as soon as guineas of full weight were issued, the exchange rose to par.

The Turkish government, during the past century, has made successive reductions in the value of its coin. Before the first of these in 1770, the *piastre* contained nearly as much silver as the English *half-crown;* and, in exchange, the par was estimated at *eight* piastres to the pound sterling. But, in the interval, the degradation in the value of the piastre has been such that it is now worth only about $2\frac{1}{4}$d.; and the exchange is said to be at par when Constantinople gives about 109 piastres for L.1 sterling. It is needless almost to say, that the nominal exchange, estimated by the old *par* of eight piastres to L.1, became more and more unfavourable to Turkey with every successive enfeeblement of the coin, though it is doubtful whether the real exchange, or that depending on the balance of payments, was not all the while in her favour.

When one country uses gold as the standard of its currency, and another silver, the par of exchange between them is affected by variations in the relative values of these metals. When gold rises as compared with silver, the exchange becomes nominally favourable to the country which has the gold standard, and *vice versa.* And hence, in estimating the par of exchange between countries using different standards, it is always necessary to inquire into the comparative values of the metals selected for standards.

"For example," to use the words of Mr Mushet, "if 34 schillings 11 grotes and $\frac{1}{4}$ of Hamburg currency be equal in value to a pound sterling, or $\frac{20}{21}$ of a guinea, when silver is at 5s. 2d. per oz., they can no longer be so when silver falls to 5s. 1d. or 5s. an oz., or when it rises to 5s. 3d. or 5s. 4d.; because a pound sterling in gold being then worth more or less silver, is also worth more or less Hamburg currency.

"To find the real par, therefore, we must ascertain what was the relative value of gold and silver when the par was fixed at 34s. $11\frac{1}{4}$g. Hamburg currency, and what is their relative value at the time we wish to calculate it.

"For example, if the price of standard gold was L.3, 17s. $10\frac{1}{2}$d. per oz., and silver 5s. 2d., an ounce of gold would then be worth 15·07 ounces of silver, and twenty of our standard shillings would then contain as much pure silver as 35s. 11 grotes and $\frac{1}{4}$ Hamburg currency. But if the ounce of gold were L.3, 17s. $10\frac{1}{2}$d., and silver 5s. (which it was on 2d January 1798), the ounce of gold would then be worth 15·57 ounces of silver. If L.1 sterling at par, therefore, be worth 15·07 ounces of silver, then at 15·57 it would be at three per cent. premium; and three per cent. premium on 34s. $11\frac{1}{4}$d. is 1 schilling 1 grote and $\frac{9}{10}$, so that the par, when gold is to silver as 15·57 to 1, will be 36 schillings 1 grote and $\frac{1}{10}$. The above calculation will be more easily made by stating, as 15·07 : 34–$12\frac{1}{4}$ :: 15·57 : 36–$1\frac{1}{10}$."[3]

As it is their intrinsic worth in bullion which determines the value of coins in exchange transactions, those of equal weight and purity are reckoned equivalent to each other, though some of them may have been coined at the expense of the state, and others charged with a duty or seignorage on their coinage. The latter may, if not issued in excess, pass current in the country in which they are coined for their value in bullion *plus* the duty; but they will not pass anywhere else, except at their bullion value.[4]

But the principal source of fluctuations in the nominal price of bills of exchange, is to be found in the varying value of the *paper* currency of commercial countries. The disorders which arose in remoter ages from diminishing the bullion contained in coins of the same denomination have since been reproduced in another form, and often to a still more ruinous extent, in the depreciation of paper currency.

Influence of depreciated paper currency on the exchange.

The impossibility of retaining a comparatively large quantity of coin or bullion, or of paper convertible into coin, in a particular country, limited the issues of the Bank of England previously to the Restriction Act of 1797; and it has equally limited them since the resumption of specie payments in 1821, and sustained the value of our currency on a level with gold. When the bank starves the circulation, or issues less paper than is necessary, bullion is imported, sent to the mint to be coined, and thrown upon the market. And when, on the other hand, the bank issues too much paper, and thereby depresses its value relatively to gold, it becomes profitable to demand payment of its notes, and to export the specie thus obtained either as coin or as bullion. In this way the vacuum is filled up when bank-notes are deficient, the excess removed when they are redundant, and the value of the currency preserved nearly equal.

But from 1797 down to 1821 this principle was suspended. During that period, the bank was relieved from the obligation to pay her notes in gold; while, owing to their being made legal tender, their circulation was insured. Hence, their value exclusively depended (see article MONEY) on the

[1] It is necessary to observe, that it is here supposed that the clipped or degraded money exists in such a degree of abundance as only to pass current at its bullion value. If the quantity of clipped money were *sufficiently limited*, it might, notwithstanding the diminution of weight, pass current at its mint value; and then the par would have to be estimated, not by its relative weight to foreign money, but by the mint price of bullion. This principle must be constantly kept in view.

[2] *Wealth of Nations*, p. 210.

[3] *An Inquiry into the effects produced on the National Currency by the Bank Restriction Bill*, &c., 2d edit., p. 94.

[4] Previously to 1817, no seignorage had for a very long period been deducted from either the gold or silver coins of Great Britain; but in the great recoinage of that year, the value of silver was raised from 5s. 2d. to 5s. 6d. an ounce, or nearly in the proportion of $6\frac{1}{2}$ per cent. The gold coins, however, are still coined free of expense, and no variation has been made in their standard. The proportion of silver to gold in the coins is now as $14\frac{287}{1000}$ to 1; but their proportion to each other, according to their mint valuation, is as $15\frac{209}{1000}$ to 1.

extent to which they were issued compared with the demand.

There is no difference, in its influence over the exchange, between a degraded metallic and a depreciated paper currency. And when a country with either the one or the other has any dealings with another whose currency is of its full value, the exchange is nominally against her to the extent of the degradation or depreciation. The nominal exchange between any two or more places, is, in fact, always adjusted according to the values of their currencies, being most favourable to that whose currency approaches nearest to its standard, and most unfavourable to that whose currency is most degraded or depreciated.

The intercourse between Great Britain and Ireland subsequently to the restriction on cash payments in 1797, furnishes some striking proofs of the effect which inordinate issues of paper have in depressing the exchange.

The nominal value of the Irish shilling being raised in 1689 from 12d. to 13d.,[1] L.108, 6s. 8d. Irish money became equal to only L.100 of British money, so that the exchange between Great Britain and Ireland was said to be at par when it was nominally $8\frac{1}{3}$ per cent. against the latter. In the *eight* years previous to 1797, when the paper currency of both countries was convertible into gold, the exchange between London and Dublin fluctuated from $7\frac{1}{2}$ to 9 per cent., that is, from $\frac{5}{6}$ per cent. in favour of Dublin to $\frac{2}{3}$ per cent. against it. In September 1797 it was at 6 per cent., or $2\frac{1}{3}$ per cent. in favour of Dublin. The amount of bank of Ireland notes in circulation in January 1797 was only L.621,917; whereas in April 1801 they had increased to L.2,286,471, and the exchange was then at 14 per cent., or $5\frac{2}{3}$ per cent. against Dublin. In 1803, the Bank of Ireland notes in circulation averaged L.2,707,956, and in October that year the exchange was quoted at 17 per cent., that is, $8\frac{2}{3}$ per cent. against Dublin!

The fact of the exchange between London and Dublin having fluctuated so little from par for the eight years previously to the restriction, shows that the circulating medium of Great Britain and Ireland had then been adjusted nearly according to the wants of the two countries. But, in these circumstances, it was evidently impracticable, supposing the value of British currency to remain nearly stationary, that the amount of Irish bank paper could be more than quadrupled in the short space of six years, without rendering the currency of Ireland redundant, and sinking its value below that of England. Had the Bank of England increased its notes in something like the same ratio as the Bank of Ireland, then, as the currency of both countries would have been equally depreciated, the exchange between London and Dublin would have continued at par. While, however, the notes of the Bank of Ireland were increased from L.621,917 to L.2,707,956, or in the proportion of 1 to 4·3, those of the Bank of England were only increased from L.9,181,843 (their number on 7th January 1797), to L.16,505,272, or in the proportion of 1 to 1·8. But for this addition to its issues by the Bank of England, the exchange, it is plain, would have been still more unfavourable to Dublin.

In the debates on the *Bullion Report*, it was contended that the increase of Bank of Ireland paper could not have been the cause of the unfavourable exchange upon Dublin, seeing that it had again become favourable after the issues of the Bank of Ireland had been still further increased. But to give this reasoning the least weight, it should have been shown that the currency of Great Britain retained its value in the interim, or that it had not been depreciated to the same extent as that of Ireland. For it is obvious that the depreciation of Irish bank paper might go on subsequently to 1804, and yet if English bank paper were depreciated still more rapidly, the exchange would become more in favour of Dublin. This is merely supposing the circumstances which took place in the first six years of the restriction to be reversed in the second six. Let us inquire how the fact stands.

We have seen that, in 1803, when the exchange was nominally 10 per cent. against Dublin, the issues of the Bank of England amounted to L.16,505,272, and those of the Bank of Ireland to L.2,707,956. And by referring to the accounts of the issues of the latter from 1797 to 1819, published by authority, it is seen that in 1805–1808 they were rather diminished; and that in 1810 they amounted to only L.3,251,750, being an increase of not more than L.543,794 in the space of seven years, or at the rate of $2\frac{6}{7}$ per cent. per annum; but in the same period (from 1803 to 1810) the issues of the Bank of England were increased from L.16,505,272 to L.22,541,523, or at the rate of 5 per cent. per annum. And this is not all. According to Mr Wakefield[2] there were *fifty* registered bankers in Ireland in 1804, and only *thirty-three* in 1810, of which fourteen were new houses, thirty-one of the old establishments having disappeared; and "I believe," says Mr Wakefield, "for the most part failed." This extraordinary diminution of the country paper of Ireland, for the reduction of the issues was at least proportional to the reduction in the number of banks, could not fail greatly to raise its value, and to countervail a corresponding increase in the issues of the national bank. Now, the reverse of all this took place in Britain. In 1800 there were 386 country banks in this country; and in 1810, this number, instead of being diminished as in Ireland, had increased to 721, having at least three times the number of notes in circulation in the latter as in the former period!

It appears, therefore, that when, in the period between 1797 and 1804, the amount of paper in circulation in Ireland was increased, and its value depressed, faster than in England, the exchange between London and Dublin became proportionally unfavourable to the latter; and, on the other hand, it appears, that when, in the six years subsequent to 1804, the paper currency of England was increased more rapidly than that of Ireland, its relative value was diminished, and the *nominal* exchange became more favourable to Dublin.

This is sufficiently conclusive. But there is still better evidence to show that the unfavourable exchange of Dublin upon London, in 1802, 1803, 1804, &c., was entirely owing to the comparative redundancy or depreciation of Irish bank paper. The linen manufacturers and weavers, with the majority of the other inhabitants of a few counties in Ulster, being, at the period of the restriction, strongly disaffected towards government, very generally refused to receive bank-notes in payment either of commodities or wages. The landlords having also stipulated for the payment of their rents in specie, a gold currency was maintained in the northern long after it had been banished from the southern parts of Ireland. If, therefore, the depression of the exchange between London and Dublin had been occasioned, as many contended, by an unfavourable balance of trade between Ireland and Great Britain, or by remittances from the former on account of absentees, it would have been equally depressed between London and the commercial towns in the northern counties. But so far was this from being the case, that in December 1803, when the exchange of Dublin on London was at $16\frac{1}{4}$ per cent., that of Belfast on London was at $5\frac{1}{4}$; or, in other words, at the very time that the exchange between Dublin, which had a paper currency, and London, was about 8 per cent. against Ireland,

[1] By a proclamation of James II. The arrangement was continued by the revolutionary government, and was confirmed by proclamation, 29th September 1737. But in 1825 the currencies of Great Britain and Ireland were assimilated.

[2] *Account of Ireland*, vol. ii., p. 171.

Exchange.

the exchange between Belfast, which had a gold currency, and London, was about 3 per cent. in its favour. And this is not all: for, while there was a difference of 11 per cent. in the rate of exchange between Dublin and London, and Belfast and London, the inland exchange between Dublin and Belfast was about 10 per cent. in favour of the latter; that is, bills drawn in Dublin, and payable in the gold currency of Belfast, brought a premium of 10 per cent., while bills drawn in Belfast, and payable in the paper currency of Dublin, sold at 10 per cent. discount![1]

It is unnecessary to refer to the history of the French *assignats*, or of the paper currency of the continental powers generally, and of the United States, to corroborate what has been advanced. Such of our readers as wish for farther information upon these points may have recourse to the fourth volume of the "Cours d'Economie Politique" of M. Storch,[2] where they will find an instructive account of the influence of inordinate issues of paper on the price of bullion and the exchange, in almost every country of Europe. They are, in every case, similar to those now stated.

It only remains to determine the influence of fluctuations in the *nominal* exchange over exports and imports.

Influence of fluctuations of exchange over imports and exports.

When the exchange is at par, the operations of the merchant are regulated entirely by the difference between foreign prices and home prices. He imports such commodities as sell at home for so much more than they cost abroad as will indemnify him for freight, insurance, &c., and yield, besides, an adequate remuneration for his trouble, and for the capital employed in the business; and he exports those whose price abroad is sufficient to cover all expenses, and to afford a similar profit. But when the *nominal* exchange becomes unfavourable to a country, the premium which its merchants receive on foreign bills has been said to enable them to export with profit, in cases where the difference between the price of the exported commodities at home and abroad might not be such as to permit their exportation with the exchange at par. Thus, if the *nominal* exchange were 10 per cent. against this country, a merchant who had consigned goods to his agent abroad, would receive a premium of 10 per cent. on the sale of the bill; and if we suppose freight, insurance, mercantile profit, &c., to amount to 6 or 7 per cent., it would at first sight appear as if we might, in such circumstances, export commodities, although their price at home were 3 or 4 per cent. higher than in other countries. If, on the other hand, the *nominal* exchange were in our favour, or if bills *on* this country sold at a premium, it would appear as if foreigners would then be able to consign goods to our merchants, or the latter to order goods from abroad, when the difference of real prices would not of itself lead to an importation.

But a very little consideration will suffice to show that fluctuations in the *nominal* exchange have no such effects. That fall in the value of the currency which renders the exchange unfavourable, and causes foreign bills to sell at a premium, equally increases the price of commodities. And hence, however great, the premium which exporters gain by selling bills on their correspondents abroad, merely indemnifies them for the enhanced price of the goods exported. In such cases, mercantile operations are conducted precisely as they would be were the exchange really at par; that is, by a comparison of real prices at home and abroad, meaning by real prices, the prices at which commodities would be sold provided there were no depreciation of the currency. If these admit of exportation or importation with a profit, the circumstance of the nominal exchange being favourable or unfavourable will make no difference whatever on the transaction.

"Suppose," says Mr Blake, who has very successfully illustrated this part of the theory of exchange, "the currencies of Hamburg and London being in their due proportions, and therefore the *nominal* exchange at par, that sugar, which, from its abundance in London, sold at L.50 per hogshead, from its scarcity at Hamburg would sell at L.100. The merchant in this case would immediately export. Upon the sale of his sugar, he would draw a bill upon his correspondent abroad for L.100, which he could at once convert into cash by selling it in the bill market at home, deriving from this transaction a profit of L.50, under deduction of the expenses of freight, insurance, commission, &c. Now, suppose no alteration in the scarcity or abundance of sugar in London and Hamburg, and that the same transaction were to take place after the currency in England had been so much increased that the prices were doubled, and, consequently, the *nominal* exchange 100 per cent. in favour of Hamburg, the hogshead of sugar would then cost L.100, leaving apparently no profit whatever to the exporter. He would, however, as before, draw his bill on his correspondent for L.100; and, as foreign bills would bear a premium of 100 per cent., he would sell this bill in the English market for L.200, and thus derive a profit from the transaction of L.100 depreciated, or L.50, estimated in undepreciated currency,—deducting, as in the former instance, the expense of freight, insurance, commission, &c.

"The case would be precisely similar, *mutatis mutandis*, with the importing merchant. The unfavourable *nominal* exchange would appear to occasion a loss amounting to the premium on the foreign bill which he must give in order to pay his correspondent abroad. But if the difference of *real* prices in the home and foreign markets were such as to admit of a profit upon the importation of produce, the merchant would continue to import, notwithstanding the premium; for that would be repaid to him in the advanced *nominal* price at which the imported produce would be sold in the home market.

"Suppose, for instance, the currencies of Hamburg and London being in their due proportions, and therefore the *nominal* exchange at par, that linen which can be bought at Hamburg for L.50 will sell here at L.100. The importer immediately orders his correspondent abroad to send the linen, for the payment of which he purchases at L.50 a foreign bill in the English market; and, on the sale of the consignment for L.100, he will derive a profit amounting to the difference between L.50 and the expense attending the import.

"Now, suppose the same transaction to take place without any alteration in the scarcity or abundance of linen at Hamburg and London, but that the currency of England has been so augmented as to be depreciated to half its value, the *nominal* exchange will then be 100 per cent. against England, and the importer will not be able to purchase a L.50 foreign bill for less than L.100. But as the prices of commodities here will have risen in the same proportion as the money has been depreciated, he will sell linen to the English customer for L.200, and will, as before, derive a profit amounting to the difference between L.100 depreciated, or L.50 estimated in undepreciated money, and the expenses attending the import.

"The same instances might be put in the case of a favourable exchange; and it would be seen, in the same manner, that *nominal* prices and the *nominal* exchange being alike dependent on the depreciation of currency, whatever apparent advantage might be derived from the former would be counterbalanced by a loss on the latter, and *vice versa*."[2]

---

[1] Farther information on this subject may be obtained from the Report, 1804, of the Committee of the House of Commons upon the state of the circulating paper in Ireland, its specie, &c.; from Sir Henry Parnell's pamphlet on the same subject; and from the pamphlets of Lord King, Huskisson, &c.

[2] Paris, 1823, 4 vols. 8vo.

Exchange.

It appears, therefore, that fluctuations in the *nominal* exchange have no effect on trade. A fall in the exchange obliges the country to which it is unfavourable to expend a greater *nominal* sum in discharging a foreign debt than would otherwise be necessary; but it does not oblige it to expend a greater real value. The depression of the *nominal* exchange can neither exceed nor fall short of the comparative depreciation of the currency. If British currency were depreciated 10 or 15 per cent., the *nominal* exchange would be 10 or 15 per cent. against us; and we should be compelled, in all transactions with foreigners, to give them 22s. or 23s. for what might otherwise have been procured for 20s. But as neither 22s. nor 23s. of such depreciated paper is more valuable than 20s. of paper undepreciated, payment of a foreign debt would, it is evident, be as easily made in the one currency as in the other; and mercantile transactions would, in such circumstances, be conducted exactly as they would have been had there been no depreciation, and the *nominal* exchange at par.

Sect. II.—*Real Exchange.*

Real exchange.

Having thus endeavoured to trace the influence which variations in the value of currencies have over the exchange, we proceed to consider how far it is influenced *by fluctuations in the supply and demand for bills.* To facilitate this inquiry, we shall exclude all consideration of changes in the value of money, and suppose the currencies of the different countries having an intercourse together to be equal in weight and purity to their mint standards, and that each has its proper supply of bullion.

When two nations trade together, and each purchases of the other commodities of the same value, their debts and credits are equal, and the real exchange is, of course, at par. But it rarely happens that the debts reciprocally due by any two countries are equal. There is almost always a balance owing on one side or other, which affects the exchange. If, for example, the debts due by London to Paris exceed those due by the former to the latter, the demand in London for bills on Paris will be greater than the demand in Paris for bills on London; and the *real* exchange will, consequently, be in favour of Paris and against London.

The expense of transferring bullion from one country to another limits the range within which the rise and fall of the real exchange between them is confined. In this respect, as in most others, transactions between foreign countries depend on the same principles which govern those between different parts of the same country. We have already seen that the fluctuations in the real exchange between London and Glasgow cannot exceed the expense of transmitting money between those cities. And this principle holds universally. Whatever may be the expense of transmitting bullion, which is the money of the commercial world, between London and Paris, London and Hamburg, New York, &c., the real exchange of the one on the other cannot, for any considerable period, be depressed to a greater extent. No merchant will pay a higher premium for a bill to discharge a debt abroad, than will suffice to cover the expense of transmitting bullion to his creditor.

Hence it appears that whatever obstructs or fetters the intercourse among different countries, proportionally widens the limits within which fluctuations in the *real* exchange may extend. And hence the reason why it varies so much more in war than in peace. The amount of the bills drawn on a country engaged in hostilities is liable, from various causes, to be suddenly increased; though, whatever may be the amounts thus thrown upon the market, the depression of the exchange cannot, for any length of time, exceed the expense of conveying bullion from the debtor to the creditor country. But during war this expense, which consists of freight, insurance, &c., is sometimes much augmented. The evidence annexed to the *Report of the Bullion Committee* shows that the cost of conveying gold from London to Hamburg, which, prior to the Revolutionary war, amounted to two or two and a half, had increased, in the latter part of 1809, to about seven per cent.; so that the limits within which fluctuations in the real exchange might range in 1809 were about three times as great as those within which they were confined in 1793.

Owing to our having the complete command of the sea, and our commerce not being subjected even to the depredations of privateers, the cost of freight and of the conveyance of bullion between this country and others has not been affected by the war in which we are now (1855) unluckily engaged.

The real exchange between neighbouring countries is generally, on the principle now explained, less likely to fluctuate than that between distant countries. It costs considerably less to transmit bullion from London to Dublin or Paris, than to New York or Canton. And, as fluctuations in the *real* exchange are limited by this cost, they may evidently extend proportionally farther between distant places than between such as are contiguous.

We have next to investigate the circumstances which give rise to a favourable or an unfavourable balance of payments, and to appreciate their effects on the real exchange, and on trade in general.

Balance of payments.

A very great, if not the principal, source of the errors into which merchants, and the majority of writers on exchange, have been betrayed in regard to the balance of payments, appears to have originated in their confounding the sum which imported commodities fetch in the home market, with their cost abroad. It is obviously, however, by the amount of the latter only, that the balance of payments, and consequently the *real* exchange, is influenced. A cargo of corn, for example, which cost L.3000 free on board at Odessa, may be worth L.4500 when imported into England; but the foreign merchant would not, unless he sent hither the corn, be entitled to draw on London for more than its original cost, or L.3000. It is clear, therefore, on the slightest consideration, that the fact of the imports being more valuable than the exports does not authorize the conclusion that the balance of payments is against us. A favourable or an unfavourable balance depends entirely on the sum due *to* foreigners for commodities bought from them being less or more than the sum due *by* them for commodities bought from us. It has nothing to do with the prices eventually obtained for the imported or exported commodities.

The *mercantile* system of commercial policy, which continues to preserve a powerful influence in most countries, had for its grand object the creation of a favourable balance of payments, by facilitating exportation and restricting importation. It is foreign to our purpose to make any inquiry in regard to the principles of this system, except in so far as they are connected with exchanges. But it may be easily shown, in opposition to the commonly received opinions, that under ordinary circumstances the value of the imports into commercial countries always exceeds the value of their exports; and that this excess or balance has not, speaking generally, any tendency to render the real exchange unfavourable.

It is the business of the merchant to carry the products of different countries from those places where their value is least, to those where it is greatest; or, which is the same thing, to distribute them according to the effective demand. There could, however, be no motive to export any article, unless that which was to be imported in its stead were more valuable. When an English merchant orders a quantity of Polish wheat, he supposes it will sell for so much more than

[1] *Observations*, &c., p. 48.

its price in Poland as will suffice to pay the cost of freight, insurance, &c., and to yield, besides, the ordinary rate of profit on the capital employed in the transfer. If the wheat did not sell for this much, its importation would be productive of loss. Merchants never export but in the view of importing articles of greater value. Instead of an excess of exports over imports being any criterion of an advantageous commerce, it is quite the reverse. And the truth is, notwithstanding all that has been said and written to the contrary, that unless the value of the imports exceeded that of the exports, foreign trade could not be carried on. Were this not the case—were the value of the exports always greater than that of the imports, there would be a loss on every transaction with foreigners, and the trade with them would either not be undertaken, or, if begun, would be speedily relinquished.

In England, the rates at which exports and imports are officially valued were fixed so far back as 1696. The very great alteration which has since taken place in the value of money, and in the cost of the greater number of the commodities of this and other countries, has rendered this official valuation, though valuable as a means of determining their quantity, of no use whatever as a criterion of the true value of the imports and exports. To obviate this defect, accounts of the *real* or *declared* value of the exports, prepared from the declarations of the merchants, are annually laid before parliament. There is, however, no such account of the imports; and it is, perhaps, impossible to frame one with anything like accuracy. It has also been alleged, and apparently with some foundation, that merchants have frequently exaggerated the value of articles entitled to drawbacks. But the extension and improvement of the warehousing system, and the decrease in the number of drawbacks, has very materially lessened whatever fraud or inaccuracy may have arisen from that source. The declared value of the exports may now be considered as pretty near the truth, at least sufficiently so for all practical purposes.

If perfectly accurate accounts could be obtained of the values of the exports and imports, there can be no manner of doubt that in all ordinary years the latter would considerably exceed the former. The value of an exported commodity is estimated when it is shipped, before its value is increased by the expense incurred in transporting it to the place of its destination; whereas the value of the commodity imported in its stead is estimated after it has arrived at its destination, and been enhanced by the charges on account of freight, insurance, importer's profits, &c.

It is of little importance, in so far at least as the interests of commerce are concerned, whether a nation carries its own imports and exports, or employs others. A carrying nation appears to derive a comparatively large profit from its commercial transactions. But this excess of profit is seldom more than a fair remuneration for the capital it employs, and the risk it incurs, in transporting commodities. Were the trade between this country and France wholly carried on in British bottoms, our merchants, in addition to the value of the exports, would also receive the cost of their carriage to France. This, however, would be no loss to the French. They must pay the freight of the commodities they import. And if English ships sail on cheaper terms than those of their own country, there is no good commercial reason, though there may be others of a different kind, why they should not employ them in preference.

In the United States the value of the imports, deduced from the custom-house returns, almost always exceeds the value of the exports.[1] And though we have been accustomed to consider the excess of exports over imports as the only sure criterion of an advantageous commerce, the practical politicians of America early discovered "that the real gain of the United States has been nearly in proportion as their imports have exceeded their exports."[2] The great excess of imports into the Union is in part occasioned by the Americans generally exporting their own surplus produce, and receiving from foreigners not only an equivalent for the exports, but also for the cost of their conveyance to their markets. "In 1811," says the author just quoted, "flour sold in America for 9 dol. 50 cents per barrel, and in Spain for 15 dol. The value of the cargo of a vessel carrying 5000 barrels of flour would, therefore, be estimated, at the period of its exportation, at 47,500 dol.; but as this flour would, because of freight, insurance, exporter's profits, &c., sell in Spain for 75,000 dol., the American merchant would be entitled to draw on his agent in Spain for 27,500 dol. more than the flour cost in America, or than the sum for which he could have drawn had the flour been exported on account of a Spanish merchant. But the transaction would not end here: the 75,000 dol. would be vested in some species of Spanish or other European goods fit for the American market; and the freight, insurance, &c., on account of the return cargo would perhaps increase its value to 100,000 dol.; so that, in all, the American merchant might have imported commodities worth 52,500 dol. more than the flour originally sent to Spain." It is as impossible to doubt that this transaction is advantageous, as it is to doubt that its advantage consists in the value of the imports exceeding that of the exports. And it is clear that America might have the balance of payments in her favour, though such transactions as the above were multiplied to any conceivable extent.

Instead, therefore, of endeavouring to limit the trade with countries from which the imports exceed the exports, we should give it every possible facility. Every man considers that market as the best in which he obtains the highest price for his goods. Why then exclude him from it? Why compel a merchant to sell a cargo of muslin, iron, &c., for L.10,500, rather than L.11,000 or L.12,000? The wealth of a state is made up of the wealth of individuals. And what more effectual method of increasing individual wealth can be devised than to permit buying in the cheapest and selling in the dearest markets?

It would be difficult to estimate the mischief which absurd notions relative to the balance of trade have occasioned in most commercial countries. They have been particularly injurious to Great Britain. The restrictions imposed on the trade with France originated in the prevalence of prejudices to which they gave rise. The great, or rather the only, argument insisted on by those who prevailed on the legislature to declare the French trade a *nuisance*,[3] was founded on the alleged fact, that the value of the imports from France considerably exceeded the value of the exports to her. The balance was termed a tribute paid by England; and it was sagaciously asked, what had we done that we should be obliged to pay so much money to our natural enemy? Those considerate and patriotic persons seem to have supposed that our merchants brought commodities from France for no better reason than that they were French, or to oblige that ingenious people. But they were not quite so disinterested. They imported French wines, silks, and so forth, for the same reasons that they imported the sugar of the West Indies, the teas and spices of the East, and the timber of the Baltic, that is, because there was a demand for them, and because they were worth more in our markets than the native products exported in their stead. The reason assigned for prohibiting the trade affords a conclusive proof of its having been advantageous. There cannot, indeed, be a doubt, that an unlimited freedom of

1 Such was always the case till the late extraordinary export of gold from California.

2 Pitkin on the *Commerce of the United States*, 2d ed., p. 280.

3 Prohibition Act, 1st William and Mary.

intercourse between the two countries would be of great service to both. Supposing it to be so arranged, does any one imagine that we should export or import any commodity to or from France, provided we could either sell or buy it on better terms anywhere else? If restrictions on the trade with any particular country be not injurious, that is, if it be either a losing or a less advantageous trade than that with other countries, we may be assured that the throwing it completely open would not make a single individual engage in it.

Everybody knows that these conclusions are not only theoretically true, but have been practically verified. The abolition of the discriminating duty on French wines, the reduction of the exorbitant duty on brandy, the repeal of the prohibition against importing silks, and the opening of our ports to French corn and flour, have all been advantageous. And though it be true that the prejudices of the French, and the high duties which they continue to impose on most articles of British produce, confine the trade within comparatively narrow limits, they have not made it unprofitable, and are more injurious to themselves than to us. It is a curious fact, that notwithstanding the great amount of our imports from France, and our expenditure in that country on account of absentees, the state of the exchange shows that the balance of payments is usually in our favour.

But the partisans of the exclusive or mercantile system may perhaps say, that they do not mean to contend that it is profitable to export more than is imported; but that, by exporting an excess of raw and manufactured produce, the balance of payments is rendered favourable, and that this balance (which they regard as representing the entire nett profit made by the country on its transactions with foreigners) is always paid in bullion.

It may, however, be easily shown that this statement is altogether erroneous; that a balance, whether on the one side or the other, is seldom or never cancelled by means of bullion; and that it is not a measure, and has, indeed, nothing to do with the profit or loss attending foreign commercial transactions.

If the premium on foreign bills, in a country with an unfavourable real exchange, be less than the cost of sending bullion abroad, it would be contradictory to suppose that it should be exported. And though the premium on such bills were to increase, till it become equal to, for it cannot exceed, the cost of exporting the precious metals, it does not follow that they will then be exported. That would depend on whether bullion were, at the time, the cheapest exportable commodity; or, in other words, whether a remittance of bullion was the most advantageous way in which a debt might be discharged. If a London merchant owe L.1000, or other sum, in Paris, he endeavours to find out the cheapest method of paying it. On the supposition that the *real* exchange is 2 per cent. below par, and that the expense of remitting bullion is also 2 per cent., it will be indifferent to him whether he pay L.20 of premium for a bill of L.1000, payable in Paris, or incur an expense of L.20 in remitting L.1000 worth of bullion direct to that city. If the prices of cloth in Paris and London be such, that it would require L.1030 to purchase and send as much cloth to Paris as would sell for L.1000, he would no doubt prefer buying a bill or exporting bullion. But if, by incurring an expense of L.1010, the debtor may send as much hardware or cotton to Paris as would sell for L.1000, he would as certainly prefer paying his debt by exporting the one or the other. It would save him 1 per cent. more than if he bought a foreign bill or remitted bullion, and 2 per cent. more than if he exported cloth. Had there been any other commodity which might have been exported with more advantage, he would have used it in preference.

It is obvious, therefore, that the trade in bullion is governed by the same principles which govern the trade in other things. It is exported when its exportation is advantageous; that is, when it is less valuable at home, and more valuable abroad, than anything else; and it will not otherwise be exported. The balance of payments might be twenty or thirty millions against a country, without depriving it of a single ounce of bullion. No merchant would remit L.1000 worth of gold or silver from England to discharge a debt in Paris, if he could invest L.970, L.980, L.990, or any sum under L.1000, in any other species of merchandise which, exclusive of expenses, would sell in France for that amount. Those who deal in the precious metals are as much alive to their interests, as those who deal in coffee, or sugar, or indigo. But who would attempt to discharge a foreign debt by exporting coffee which cost L.100, if he could effect the same object by exporting indigo which cost only L.95? No bullion will ever be exported unless its value be less in the exporting country than in that to which it is sent; and unless it be, at the same time, the most advantageous article of export.

2. It is in vain to contend that an unrestricted freedom of trade might render some unfortunate country indebted to another so happily situated that it had no demand for any sort of ordinary merchandise, and would only accept of cash or bullion in exchange for its exports. A case of this sort never did, and never will, occur. It is not even possible. A nation which is in want of money must be in want of other things; for men desire money only because it is the readiest means of increasing their command over necessaries and enjoyments. The extreme variety, too, in the soils and climates—in the machinery, skill, and industry of the people of different countries—occasion extraordinary differences in their products and prices. Some articles of the highest utility are peculiar to certain districts. And there will ever be a demand, not only for such articles, but also for those which, though they may be produced at home, may be imported of a better quality, or at a lower price. Nor, till the passion of accumulation be banished from the human breast, will there cease to be a desire to send commodities from places where their exchangeable value is least, to those where it is greatest.

3. In treating of the *nominal* exchange, we endeavoured to show that no single country can continue, for any length of time, to import or export a greater amount of bullion than may be necessary to preserve the precious metals in it in their proper relation to those of other countries; or, which is the same thing, to have the *real* exchange either permanently favourable or unfavourable. But though this principle be strictly true in reference to its aggregate exchanges, it may be incorrect if its exchange with one country only be considered. Great Britain, for example, may generally have the exchange in her favour with America, provided she have it generally, and to a nearly equal extent, against her with the East Indies, or some other country. "She may," to use the words of Mr Ricardo, "be importing from the north the bullion which she is exporting to the south. She may be collecting it from countries where it is relatively abundant, for others where it is relatively scarce, or where, from some particular causes, it is in great demand. Spain, who is the great importer of bullion from America, can never have an unfavourable exchange with her colonies; and as she must distribute the bullion she receives among the different nations of the world, she can seldom have a favourable exchange with the countries with which she trades."[1]

On this principle, Lord King successfully accounted for the favourable exchange between this country and Hamburg from 1770 to 1799. He showed that the importation of bullion from Hamburg and other parts was not more than

[1] See *Reply to Mr Bosanquet's Observations on the Report of the Bullion Committee*, p. 17.

Exchange.

equivalent to the exports to the East Indies and the home consumption; that the demand corresponded to the supply; and that its value remained pretty stationary. The extraordinary influx of bullion into this country from the Continent at the era of the Bank restriction in 1797, and the favourable state of the exchange, were undoubtedly owing to the reduction in the issues of bank paper, and to the diminution of the gold currency caused by the hoarding of guineas. In 1797 and 1798, above *five* millions of guineas were coined at the mint; and this extraordinary demand for gold is of itself abundantly sufficient to account for the very favourable exchange of that period, and for the length of time during which it continued. But, at the same time that the demand for gold bullion for the mint was thus increased, the demand for silver bullion, for export to India, was proportionally augmented.

In 1795, the quantity exported by the East India Company and private parties amounted to......	151,795	ounces.
In 1796, to...	290,777	...
1797	962,880	...
1798	3,565,691	...
1799	7,287,327	...

From this period the exportation rapidly declined; and, in the years in which the exchange was most unfavourable, little or no silver was sent to India.

Instead, therefore, of the extraordinary importation of bullion from Hamburg in 1797 and 1798 affording, as Mr Bosanquet and others supposed, a practical proof of the fallacy of the opinion of those who contend that it is impossible, for any length of time, to subvert the natural equality in the value of bullion in different countries, it is a striking example of its truth. Without this influx, bullion in this country could not have maintained its proper comparative value. We imported it, because the reduction of the paper currency, and the increased exports of the East India Company, rendered its value higher here than on the Continent; and made it advantageous for the continental merchants to send it to us, in the same manner as they would have sent corn, or anything else for which we had an unusual demand. For, however favourable the *real* exchange between Hamburg and London might have been to the latter, we should not have imported an ounce of bullion, had it not been, at the time, the article with which Hamburg could most advantageously discharge her debt to London.

4. In the absence of other arguments, it would be sufficient to state, that it is physically impossible that the excess of exports over imports, as indicated by the custom-house returns, should be paid in bullion. Every country, with the exception of the United States, has its apparently favourable balance; and, of course, if they really existed, they would have to be paid by an influx of bullion from the mines correspondent to their aggregate amount. It is certain, however, that, previously to the late discoveries in California and Australia, the entire produce of the mines, though it had been increased in a *tenfold* proportion, would have been insufficient for this purpose! This fact is decisive of the degree of credit which ought to be attached to the commonly received opinions on this subject.

5. In the last place, the profit on transactions with foreigners does not consist in the quantity of bullion imported from abroad, but in "the excess of the value of the imports over the value of the exports." If, in return for exported commodities worth ten or twenty millions, we import such as are worth fifteen or thirty, we shall gain 50 per cent. by the transaction, though the exports should consist entirely of bullion, and the imports of corn, sugar, coffee, &c. It is a ridiculous prejudice that would make bullion be imported rather than any other article. But whatever the partisans of the exclusive system may say about its being a preferable product, a *marchandise par excellence*, we may be assured that it will seldom appear in the list of exports or imports, while there is any other thing with which to carry on trade that will yield a larger profit.

Exchange.

Thus it appears that the excess of exports over imports, instead of being any proof of an advantageous commerce, is distinctly and completely the reverse; that the value of the imports into commercial countries may, and almost always does, exceed the value of their exports, without rendering them indebted to foreigners; and that when a balance of debt has been contracted, that is, when the sum *payable to* foreigners for imports is greater than the sum *receivable from* them for exports, bullion will not be sent from the debtor to the creditor country, unless it be at the time the most profitable article of export.

We have in the previous *section* shown that fluctuations in the nominal exchange have no influence over foreign trade. When the currency is depreciated, the premium which an exporter derives from the sale of bills on his correspondent abroad, is barely equivalent to the increase in the price of the exports, occasioned by the depreciation. But when the premium on foreign bills is not caused by a fall in the value of money, but by a deficient supply of bills, there is no rise of prices, and then the unfavourable exchange undoubtedly operates as a stimulus to exportation. As soon as the *real* exchange diverges from par, the mere inspection of price currents is no longer enough to guide the operations of the merchant. If it be unfavourable, the premium which the exporters receive on the sale of bills must be included in the estimate of the profit they are likely to derive from the transaction. The greater that premium, the less will be the difference of prices necessary to make them export. An unfavourable *real* exchange has, in truth, exactly the same effect on exportation as a bounty equal to the premium on foreign bills.

Influence of fluctuations of real exchange over imports and exports.

But for the same reason that an unfavourable *real* exchange increases exportation, it diminishes importation. When it is unfavourable, the prices of foreign products brought to our markets must be so much under their prices here, as not merely to afford, exclusive of expenses, the ordinary profit on their sale, but also to pay the premium which the importer must give for a foreign bill, if he remit one to his correspondent, or for the discount, added to the invoice price, if the latter draw upon him. A less quantity of foreign goods will therefore suit our markets when the exchange is really unfavourable; and fewer payments having to be made abroad, the competition for foreign bills is diminished, and the exchange rendered proportionally favourable. A favourable *real* exchange, consequently, operates as a duty on exportation and a bounty on importation.

Hence it is obvious that fluctuations in the *real* exchange have a necessary tendency to correct themselves. They can never, for any considerable period, exceed the expense of transmitting bullion from the debtor to the creditor country. And the exchange cannot continue permanently favourable or unfavourable even to this extent. When favourable, it corrects itself by restricting exportation and facilitating importation; and when unfavourable, it produces the same effect by stimulating exportation and obstructing importation. The true PAR forms the centre of these oscillations. And though the thousand circumstances which daily and hourly affect the state of debt and credit, prevent the ordinary course of exchange from being almost ever precisely at par, its fluctuations, whether on the one side or the other, are confined within certain limits, and have a constant tendency to disappear.

The natural tendency which the exchange has to correct itself is powerfully assisted by the operations of the bill merchants.

England, for example, may owe an excess of debt to Amsterdam, yet, as the aggregate amount of the debts due

by a commercial country, is generally balanced by the amount of those which it has to receive, the deficiency of bills on Amsterdam in London will most probably be countervailed by their redundancy in some other quarter. And, it is the business of the merchants who deal in bills, as of those who deal in bullion or any thing else, to buy them where they are cheap, that they may sell them where they are dear. They, therefore, buy up the bills drawn by other countries on Amsterdam, and dispose of them in London; and, by so doing, prevent any great fall in the price of bills on the former in the countries in which their supply exceeds the demand, and any great rise in Great Britain and the countries in which their supply happens to be deficient. In our trade with Italy, the bills drawn on England generally amount to a greater sum than those drawn on Italy. The bill merchants, however, by buying up the excess of Italian bills on London, and selling them in France, Holland, and other countries indebted to England, prevent the *real* exchange from being much depressed.

An unusual deficiency in the supply of corn, or of any article of prime necessity, by causing a sudden augmentation of imports, materially affects foreign debts and credits, and depresses the exchange. In time of war, the balance of payments is liable to be still further disturbed; the amount of the bills drawn on a country carrying on foreign hostilities, being increased by the whole expense of its armaments abroad, and of subsidies to foreign powers. But neither the conjoined nor separate influence of both or either of these causes has any permanent influence over the exchange. A sudden increase in the accustomed supply of bills must, in the first instance, by glutting the market, occasion their selling at a discount; but this effect will only be temporary. The unusual facilities which are then afforded for exportation, and the difficulties which are thrown in the way of importation, never fail speedily to bring the *real* exchange to par.

During a period of peace we may, in the too great ardour of speculative enterprise, export an excess of produce, overload the foreign market, and occasion such a decline in the prices of our goods abroad, as to make the imports less valuable than the exports with which they have been purchased. But such a state of things can only be of limited duration. The distress of which it is productive, assisted by the fall of the exchange, occasions a diminution of exports. The supply of our commodities in the foreign markets is rendered more nearly commensurate with the demand; till in no long time the value of the imports again exceeds, as it always ought to do, the value of the exports. But when a country has a large foreign expenditure to sustain, its exports are proportionally augmented. Whatever may have been the foreign expenditure of Great Britain during the late war, it is evident it could not be defrayed otherwise than by our annually exporting an equal amount of the produce of our land, capital, and labour, for which payment was not received, as in ordinary cases, by a corresponding importation of foreign commodities, but from the treasury at home. This is strictly true, even though the expenditure should have happened to be, in the first instance, discharged by remittances of bullion; for the increased supply of bullion which was thus required could be obtained only by an equally increased exportation of other products to the countries possessed of mines, or from which it was imported. Foreign expenditure, by increasing exports in proportion to its own amount, has no permanent influence over the exchange.

Thus it appears that an excess of exports, instead of being any criterion of increasing wealth at home, is only a certain indication of commercial losses, or of expenditure abroad. "When," says Mr Wheatley, "the exports exceed the imports, as they must do when there is a large foreign expenditure, the equivalents for the excess are received abroad in as full and ample a manner as if the produce which they purchased were actually imported and entered in the custom-house books, and afterwards sent to the seat of war for consumption. But from the circumstance of its not being inserted in the custom-house entries as value received against the produce exported for its payment, the latter is deemed to constitute a favourable balance, when it is in reality exported to liquidate a balance against us."[1]

But how conclusive soever this reasoning may appear, it has been said to be at variance with the fact; and the rise of the exchange at the end of the late war, during the suspension of cash-payments, has been appealed to as showing that its previous low rate had not been occasioned by any depreciation of the paper currency, but by the excessive amount of the bills drawn upon this country to defray war expenditure. The question, however, is not whether the exchange recovered from its depression during the suspension of cash-payments, for the influence of that measure depended entirely on the use made of it, but whether its recovery took place without the amount of bank paper of all sorts, or of the currency, being diminished? The statements made in the article MONEY are decisive upon this point. They show that the currency was very greatly diminished in 1814, 1815, and 1816; and that this diminution occasioned the rise in its value, and in the nominal exchange.

Mr Francis Horner, the well-informed chairman of the Committee on the High Price of Bullion, made the following statement in regard to this very question in his place in the House of Commons:—

"From inquiries he had made, and from the accounts on the table, he was convinced that a greater and more sudden reduction of the circulating medium had never taken place in any country than had taken place since the peace in this country, with the exception of those reductions that had taken place in France after the Mississippi scheme, and after the destruction of the assignats. The reduction of the currency had originated in the previous fall of the prices of agricultural produce. That fall had produced a destruction of country-bank paper, to an extent which would not have been thought possible, without more ruin than had actually ensued. The Bank of England had also restricted its issues. As appeared by the accounts recently presented, the average amount of its currency was not, during the last year, more than between L.25,000,000 and L.26,000,000; while two years ago it had been nearer L.29,000,000, and at one time even amounted to L.31,000,000. But, without looking to the diminution of Bank of England paper, the reduction of the country paper was enough to account for the rise which had taken place in the exchange."

Hence it appears that the rise of the exchange in 1815 and 1816, had nothing, or but little,[2] to do with the cessation of hostilities, and was entirely, or mainly, a consequence of the increased value of the currency, caused by the reduction of its quantity. Instead of being at variance with the principles we have been endeavouring to elucidate, this fact affords a strong confirmation of their correctness. And having been sanctioned by the fullest experience, they may be considered as beyond the reach of cavil and dispute.

An objection of a different sort has been made, to another part of the theory maintained in this *section*, which it may be proper to notice.

When the exchange becomes unfavourable, the premium, procured by the sale of the bill drawn on a foreign merchant to whom bullion has been consigned, is no greater than would be obtained by consigning to him an equivalent

[1] Wheatley, *on the Theory of Money*, p. 219.

[2] The real exchange might probably be affected to the extent of one or two per cent.

Exchange. amount of coffee, tea, sugar, indigo, &c. An unfavourable *real* exchange permits a merchant to export commodities which could not be exported were it at par, or favourable. But the advantage still remains of exporting those commodities in preference, whose price in the country from which they are sent, compared with their price in that to which they are sent, is lowest. Suppose, for example, that the expense of transmitting bullion from this country to France is *three* per cent., that the *real* exchange is *four* per cent. against us, that the price of bullion is the same in both countries, and that coffee, exclusive of the expenses of carriage, is really worth *four* per cent. more in France than in England. In such a case, it is obvious that the exporters of bullion would realise a profit of only *one* per cent., while the exporters of coffee would realise, inclusive of the premium on the sale of the foreign bill, a profit of *seven* per cent. And hence the opinion maintained by Colonel Torrens,[1] that when the exchange becomes unfavourable, those commodities which contain the greatest value in the smallest bulk, or on which the expense of carriage is least, are exported in preference, appears to have no good foundation. The prices of the commodities which nations trading together are in the habit of exporting and importing, are regulated not merely by the cost of their production, but also by the expense of their carriage from where they are produced to where they are consumed. If Great Britain were in the habit of supplying France with cottons and bullion, the average price of cottons in France, because of the expense required to convey them there, would probably be from 5 to 6 per cent. higher than in Britain; while, because of the comparative facility with which bullion may be transported from the one to the other, its value in Paris would not, perhaps, exceed its value here more than 1 per cent. Now, suppose that, when the prices of cottons and bullion in England and France are adjusted according to their natural proportions, the *real* exchange becomes unfavourable to us, it is clear that its fall gives no greater advantage to the exporters of bullion than to those of cottons. The rise in the price of foreign bills does not increase the expense of exporting the one or the other. It leaves the cost of their reduction and transportation exactly where it found it. During the depression of the exchange, the exporters of both articles get the premium on the bills drawn on their correspondents. But there is no inducement to export bullion in preference to cottons, unless the price of bullion increase more rapidly in France, or decline more rapidly in Great Britain, than that of cottons.

Whatever, therefore, may be the depression of the exchange, the merchant selects those commodities for exportation which, exclusive of the premium, yield the greatest profit on their sale. If bullion be one of these, it will of course be exported; if not, not. But of all commodities, bullion is that of which the value approaches nearest to an equality in different countries, so that it is the least likely to be exported during an unfavourable exchange. The demand for it is comparatively steady, and no great surplus quantity could be imported into one country without reducing, or exported from another without raising, its value, so as to unfit it either for exportation or importation. In most cases a small part only of an unfavourable balance is paid in bullion. The operations of the bullion merchants are chiefly confined to the distribution of the fresh supplies obtained from the mines, in proportion to the wants of different countries.

Sect. III.—*Computed Exchange.*

Having thus endeavoured to point out the manner in which variations in the values of the currencies of nations trading together, and in the supply and demand for bills, separately affect the exchange, it now only remains to ascertain their combined effect, or the *computed* or actual course of exchange.

Computed exchange. From what has been already stated, it is obvious, that when the nominal and real exchange are both favourable or both unfavourable, the *computed* exchange will express their *sum;* and that when the one is favourable and the other unfavourable, it will express their *difference.*

When, for example, the currency of Great Britain is of the mint standard and purity, while that of France is 5 per cent. degraded, the *nominal* exchange will be 5 per cent. in our favour. But the *real* exchange may, at the same time, be either favourable or unfavourable. If it be, also, favourable to the extent of one, two, three, &c., per cent., the computed exchange will be six, seven, eight, &c., per cent. in our favour. And, on the other hand, if it be unfavourable to the extent of one, two, three, &c., per cent., the *computed* exchange will be only four, three, two, &c., per cent. in our favour. When the *real* exchange is in favour of one country, and the *nominal* exchange equally against it, the *computed* exchange is at par, and *vice versa.*

A comparison of the market with the mint price of bullion affords the best and readiest means by which to ascertain the state of the exchange. When there are no restrictions on the trade in the precious metals, the excess of the market over the mint price of bullion affords an accurate measure of the depreciation of the currency. If the market and mint price of bullion at Paris and London exactly corresponded, then, inasmuch as the real value of bullion must be very nearly the same in both countries, the *nominal* exchange would be at par; and whatever fluctuations the computed exchange might exhibit, must, in such case, be traced to fluctuations in the *real* exchange, or in the supply and demand for bills. If, when the market price of bullion in Paris is equal to its mint price, it exceeds it 2 per cent. in London, it is a proof that our currency is 2 per cent. depreciated, and consequently the *nominal* exchange between Paris and London *must* be 2 per cent. against the latter. Instead, however, of the *computed* or actual course of exchange being 2 per cent. against London, it may be against it to a greater or less extent, or in its favour. It will be more against it provided the *real* exchange be also unfavourable; it will be less against it provided the *real* exchange be in favour of London, though to a less extent than the adverse *nominal* exchange; and it will be in favour of London, should the favourable *real* exceed the unfavourable *nominal* exchange. Thus, if, while British currency is 5 per cent. depreciated, and French currency at par, the computed or actual course of exchange between Paris and London were 10 or 12 per cent. against the latter, it would show that the *real* exchange was also against this country to the extent of 5 or 7 per cent. And if, on the other hand, the computed exchange were only 2 or 3 per cent. against London, it would show that the *real* exchange was 3 or 4 per cent. in its favour, and so on.

It has been already shown, that, in so far at least as the question of exchange is involved, the differences in the value of bullion in different countries are limited by the expense of its transit from one to another. And hence, by ascertaining whether a particular country exports or imports bullion to or from other countries, we may determine its comparative value in these countries. Suppose, for example, that the expense of conveying bullion from this country to France, including the profits of the bullion dealer, is 1 per cent.; it is clear, inasmuch as bullion is exported only to find its level, that whenever our merchants begin to export it to France, its value there must be at least 1 per cent. greater than in England; and, on the contrary, when they

[1] *Comparative Estimate,* &c.

import bullion from France, its value here must be, at least, 1 per cent. greater than in France. In judging of the exchange between any two countries, this circumstance should always be attended to. If no bullion be passing from the one to the other, we may conclude that its value is nearly the same in both; or, at all events, that the difference of its value is not more than the expense of transit. On the supposition that the entire expense, including profit, of conveying bullion from San Francisco to London is 5 per cent., and that London is importing bullion, it is clear, provided the real exchange be at par, and the currency of both cities at their mint standards, that the *nominal*, or, which in this case is the same thing, the *computed* exchange, will be 5 per cent. in favour of London. But if the currency of London be 5 per cent. depreciated, or, in other words, if the market price of bullion at London be 5 per cent. above its mint price, the *computed* exchange between it and San Francisco, supposing the *real* exchange to continue at par, will obviously be at par. It may therefore be laid down as a general rule, that when bullion begins to pass from one country to another, the expense of transit, provided the mint and market price of bullion in the exporting country correspond, will indicate how much the value of bullion in it is below its value in the country into which it is imported, and will be identical with its unfavourable *nominal* exchange; and that, when the market exceeds the mint price of bullion in the exporting country, the expense of transit added to this excess will give the total comparative reduction of the value of the precious metals in that country. The converse of this takes place in the country importing bullion. When its currency is of the mint standard, the expense of transit is the measure of its favourable nominal exchange; but when its currency is relatively redundant or degraded, the difference between the expense of transit and the excess of the market above the mint price of bullion, will measure the extent of the favourable or unfavourable nominal exchange. It will be favourable when the depreciation is less than the expense of transit, and unfavourable when it is greater.

From 1809 to 1815 inclusive, Great Britain continued to export gold and silver to the Continent. During this period, therefore, we must add the expense of its export to the excess of the market over the mint price of bullion, to get at the true relative value of British currency, and the state of the *real* exchange. Mr Goldsmid stated to the bullion committee that, during the last five or six months of 1809, the expense of transporting gold to Holland and Hamburg, including freight, insurance, exporter's profits, &c., varied from 4 to 7 per cent. But at the time that the relative value of bullion in Britain was at 5½ (medium of 4 and 7) per cent. below its value in Hamburg, the market price of gold bullion exceeded its mint price 16 or 20 per cent., or 18 per cent. at an average; so that the currency of this country, as compared with that of Hamburg, which differed very little from its mint standard, was depreciated to the extent of about 23½ per cent. Now, as the *computed* or actual course of exchange varied, during the same period, from 19 to 21 per cent. against London, it is plain that the *real* exchange could not be far from par. Had the *computed* exchange been less unfavourable, it would have shown that the *real* exchange was in favour of London; had it been more unfavourable, it would, on the contrary, have shown that the *real* exchange was against London.

Provided an accurate account could be obtained of the expense attending the transit of bullion from this country to the Continent during the subsequent years of the war, it would, most likely, be found, notwithstanding the extraordinary depression of the *nominal*, that the *real* exchange varied but little from par; and that the exportation of gold and silver was not a consequence of the balance of payments being against us, but of its being advantageous to export bullion, because of its being more valuable on the Continent. None will contend that, in 1809, 1810, &c., gold and silver were so redundant in this country as to sink their relative value. Any such supposition is out of the question. During the period referred to, they were sent abroad, because the depreciation of paper exceeded the cost of the transit of bullion; and it was everybody's interest to pay their debts in the depreciated currency, and to export that which was undepreciated to countries where it passed at its full value as coin, or in which bullion was in greater demand. Had our paper currency been sufficiently reduced, the supply of gold in the kingdom in 1809, 1810, &c., compared with the demand which must, under such circumstances, have been experienced, was so very small, that instead of exporting, we should have imported the precious metals from all parts of the world.

The extraordinary exportation of British goods to the Continent during the latter years of the war, has been very generally supposed to have been in great measure owing to the depression of the exchange. But, in so far as this depression was occasioned by the redundancy or depreciation of the currency, it could have no such effect. It is impossible, indeed, to form any opinion as to the influence of fluctuations in the *computed* exchange on export and import trade, without previously ascertaining whether they are a consequence of fluctuations in the *real* or *nominal* exchange. It is only by an unfavourable *real* exchange that exportation is facilitated; and it may be favourable when the *computed* exchange is unfavourable. "Suppose," to use an example given by Mr Blake, "the computed exchange between Hamburg and London to be 1 per cent. against this country, and that this arises from a *real* exchange which is favourable to the amount of 4 per cent., and a nominal exchange unfavourable to the extent of 5 per cent.; let the real price of bullion at Hamburg and London be precisely the same, and, consequently, the *nominal* prices different by the amount of the *nominal* exchange, or 5 per cent.; now, if the expenses of freight, insurance, &c., on the transit of bullion from Hamburg are 3 per cent., it is evident that a profit would be derived from the import of that article, notwithstanding the *computed* exchange was 1 per cent. against us. In this case the merchant must give a premium of 1 per cent. for the foreign bill, to pay for the bullion: L.100 worth of bullion at Hamburg would therefore cost him L.101, and the charges of importation would increase the sum to L.104. Upon the subsequent sale, then, for L.105 of depreciated currency in the home market, he would derive from the transaction a profit of L.1. This sum is precisely the difference between the *real* exchange and the expenses of transit, that part of the *computed* exchange which depends on the *nominal* producing no effect; since whatever is lost by its unfavourable state is counterbalanced by a corresponding inequality of *nominal* prices."[1] In the same manner it may be shown that, though the *computed* be favourable, the *real* exchange may be unfavourable; and that, consequently, it may be really advantageous to export, when it is apparently advantageous to import. But it would be tedious to multiply instances, which, as the intelligent reader will readily conceive, may be infinitely varied, and which have been sufficiently explained in the foregoing sections.

The real cause of the extraordinary importation of British produce into the Continent, in 1809, 1810, 1811, &c., notwithstanding the anti-commercial system of Napoleon, is to be found in the annihilation of the neutral trade, and our monopoly of the commerce of the world. The entire produce of the East and West was at our disposal. The Continental nations could neither procure colonial products, nor

[1] *Observations*, &c., p. 91.

Exchange.

raw cotton for the purposes of manufacturing, except from England. British merchandise was thus almost indispensable; and to this our immense exportation, in spite of all prohibitions to the contrary, is to be ascribed.

HISTORY AND INFLUENCE OF BILLS OF EXCHANGE.

History of bills of exchange.

It is not easy to discover the æra when bills of exchange were first employed to transfer and adjust the mutual claims and obligations of merchants. Their invention has been ascribed to the Arabians and Jews of the middle ages. But it seems certain that they were in use in remote antiquity. Isocrates states that a stranger who brought some cargoes of corn to Athens, furnished a merchant of the name of Stratocles with an order or bill of exchange on a town on the Euxine, where money was owing to him; and, because the person who had drawn the bill had no fixed domicile, Stratocles was to have recourse on a merchant in Athens, in the event of its being protested. The merchant, says Isocrates, who procured this order found it extremely advantageous, inasmuch as it enabled him to avoid risking his fortune on seas covered with pirates, and the hostile squadrons of the Lacedemonians.[1]

There is also good evidence to show that the method of transferring and cancelling the debts of parties residing at a distance by means of letters of credit, which are in effect the same as bills of exchange, was not unknown to the Romans. Cicero, in one of his epistles to Atticus,[2] inquires whether his son must carry cash to defray the expense of his studies with him to Athens, or whether he might not save this trouble and risk by obtaining an assignment for an equivalent sum from a creditor in Rome on his debtor in Athens. It is evident, from a subsequent epistle of Cicero, that the latter method had been preferred, and that the transference of the money had, in consequence, been rendered unnecessary.[3]

Macpherson states,[4] that the first mention of bills of exchange in modern history occurs in 1255. The pope, having quarrelled with Manfred, king of Sicily, engaged, on Henry III. of England agreeing to indemnify him for the expense, to depose Manfred, and raise Henry's second son, Edmund, to the Sicilian throne. The enterprise misgave. But the merchants of Sienna and Florence, who originally advanced the money to carry it into effect, or rather to gratify the pope's rapacity, were paid by bills drawn on the prelates of England, who, although they protested that they knew nothing at all about the transaction, were nevertheless compelled, under pain of excommunication, to pay the bills and interest![5]

Capmany, in his "Memoirs" respecting the Commerce, &c., of Barcelona, gives a copy of an ordonnance of the magistracy, dated in 1394, enacting that bills should be accepted within twenty-four hours after their presentation; a sufficient proof that they were in general use in the end of the fourteenth century.

But whatever be the æra of the introduction of bills of exchange, few inventions have redounded more to the public advantage. Without this simple and ingenious contrivance, commerce could have made no great progress. Had there been no means of adjusting the mutual claims of debtors and creditors otherwise than by the intervention of metallic money (for bank paper is only another species of bills of exchange), a very large portion of that capital which is setting productive labour in motion in every quarter of the globe, and ministering to the wants and enjoyments of mankind, must have been employed in effecting those exchanges which are much better effected by the agency of a few quires of paper. Instead of a perpetual importation and exportation of gold and silver, necessarily attended with an immensity of trouble and expense, bills, possessing little or no intrinsic worth, and which are transferred with the utmost facility, suffice to adjust the most extensive and complicated transactions. But the mere setting free of an immense productive power, engaged in a comparatively unprofitable employment, is only one of the many benefits we owe to the use of bills. By cheapening the instruments by which commerce is carried on, they have materially reduced the prices of most articles. And have, in consequence, increased the command of all classes over necessaries and luxuries, and accelerated the progress of civilization, by occasioning a more extensive intercourse and intimate connection between different and independent countries than would otherwise have taken place.

In a political point of view their effects have been equally salutary. They enable individuals imperceptibly to transfer their fortune to other countries, and to preserve it safe alike from the rapacity of their own governments and the hostile attacks of others. The security of property has, in consequence, been vastly augmented. And though we should concede to the satirist that paper credit has "lent corruption lighter wings to fly,"[6] it has, at the same time, powerfully contributed to render subjects less dependent on the policy, and less liable to be injuriously affected by the injudicious measures of their rulers. In countries in a low stage of civilization the inhabitants endeavour, by burying all the gold and silver they can collect, to preserve a part of their property from the despots by whom they are alternately plundered and oppressed. This was universally the case in the middle ages; and in Turkey, India, Persia, and other eastern, and also in some European, countries, the practice is still carried on to a greater or less extent. Some economists have endeavoured to account for the long-continued importation and high value of the precious metals in India, by the loss which necessarily attends the practice of hoarding; and undoubtedly this locking-up of capital, while it evinces an extreme degree of insecurity, is a main cause of the poverty of these countries. But the security afforded by bills of exchange is infinitely greater than any which can be derived from the barbarous expediment of trusting property to the bosom of the earth. "Pregnant with thousands flits the *scrap* unseen," and in a moment places the largest fortune beyond the reach of danger. Mr Harris was therefore right in saying, "that the introduction of bills of exchange was the greatest security to merchants, both as to their persons and effects, and consequently the greatest encouragement to commerce, and the greatest blow to despotism, of anything that ever was invented."[7]

[6] "Blest paper credit! last and best supply!
That lends corruption lighter wings to fly!
Gold, imp'd by thee, can compass hardest things,
Can pocket states, can fetch or carry kings;
A single leaf shall waft an army o'er,
Or ship of senates, to some distant shore;
A leaf, like Sibyll's, scatter to and fro
Our fates and fortunes, as the wind shall blow;
Pregnant with thousands, flits the scrap unseen,
And silent sells a king, or buys a queen."—POPE.

[7] Harris *on Coins*, part i, p. 108.

Its extensive commerce, the wealth and punctuality of its merchants, and their intimate connection with all the other great trading cities of the world, made Amsterdam, previously to the peace of 1763, the chief place where the accounts of commercial countries were balanced and adjusted. But the loss of foreign trade, and the other vexations to which Holland was subjected during the ascendancy of the French, nearly divested Amsterdam of all share in this business; and it has not since recovered its former superiority. London is now the trading metropolis of Europe and of the world, *universi orbis terrarum emporium.* The vast extent of its commercial dealings necessarily renders it the great mart for bills of exchange. Its bill-merchants, a class of men remarkable for their shrewdness, and generally possessed of large capitals, assist in trimming and adjusting the balance of debt and credit between the most remote countries. They buy up bills where they are cheap, and sell them where they are dear, and, by the extent of their correspondence and the magnitude of their transactions, give a steadiness to the exchange to which it could not otherwise attain.

NEGOTIATION OF BILLS OF EXCHANGE.

Negotiation of bills of exchange.

Bills of exchange may be made payable on *demand* (the invariable term of payment in the case of checks), at *sight*, at a certain specified time *after sight* or *after date*, or at *usance*, which is the usual term allowed by the custom or law of the place where the bill is payable. Generally, however, a few days are allowed for payment beyond the term when the bill becomes due, which are denominated *days of grace*, and which vary in different countries. In Great Britain and Ireland, *three* days' grace are allowed on all bills except those payable on demand, which must be paid as soon as presented. The following is a statement of the usance and days of grace for bills drawn upon some of the principal commercial cities:—

[*m/d. m/s. d/d. d/s. d/a.* respectively denote *months after date, months after sight, days after date, days after sight, days after acceptance.*]

London on	Usance.	Days of Grace
Amsterdam	1 m/d.	0
Rotterdam	1 m/d.	0
Antwerp	1 m/d.	0
Hamburg	1 m/d.	12
Altona	1 m/d.	12
Dantzic	14 d/a.	10
Paris*	30 d/d.	0
Frankfort	14 d/s.	4
Bremen	1 m/d.	8
Barcelona	60 d/d.	14
Geneva	30 d/d.	5
Madrid	2 m/s.	14
Cadiz	60 d/d.	6
Bilboa	2 m/d.	14
Gibraltar	2 m/s.	14
Leghorn	3 m/d.	0
Leipzig	14 d/a.	0
Genoa	3 m/d.	30
Venice	3 m/d.	6
Vienna†	14 d/a.	3
Malta	30 d/d.	13
Naples	3 m/d.	3
Palermo	3 m/d.	0
Lisbon	30 d/s.	6
Oporto	30 d/s.	6
Rio Janeiro	30 d/d.	6
Dublin	21 d/s.	3
New York	60 d/s.	3

* In France, days of grace were suppressed by the *Code de Commerce*, art. 135.

† In Austria, bills payable at sight, or on demand, or at less than 7 days after sight or date, are not allowed any days of grace. In Petersburg, bills after date are allowed 10 days' grace, but after sight only 3 days' do.

In the dating of bills, the new style is used in every country of Europe, with the exception of Russia.

In London bills of exchange are bought and sold by brokers, who go round to the principal merchants and discover whether they are buyers or sellers of bills. A few of the brokers of most influence, after ascertaining the state of the relative supply and demand for bills, suggest a price at which the greater part of the transactions of the day are settled, with such deviations as particular bills, from their being in very high or low credit, may be subject to. The price fixed by the brokers is that which is published in Wittenhall's List; but the first houses generally negotiate their bills on ½, 1, 1½, and 2 *per cent.* better terms than those quoted. In London and other great commercial cities a class of middlemen speculate largely on the rise and fall of the exchange; buying bills when they expect a rise, and selling them when a fall is anticipated.

It is usual, in drawing foreign bills of exchange, to draw them in sets, or duplicates, lest the first should be lost or miscarry. When bills are drawn in sets, each must contain a condition that it shall be payable only while the others remain unpaid: thus, the first is payable only, "second and third unpaid;" the second, "first and third being unpaid;" and the third, "first and second unpaid."

All bills of exchange must be drawn upon stamps as under:—

INLAND BILL OF EXCHANGE, Draft, or Order, for the Payment to the Bearer, or to Order, at any Time otherwise than on Demand, of any Sum of Money

	L.	s.	d.
Not exceeding L.5	0	0	1
Exceeding L.5 and not exceeding 10	0	0	2

FOREIGN BILL OF EXCHANGE drawn out of the U. K., and payable within the U. K., the same Duty as on an Inland Bill of the same Amount and Tenor.

FOREIGN BILL OF EXCHANGE drawn out of the U. K., and payable out of the U. K., but indorsed or negotiated within the U. K., the same Duty as on a Foreign Bill drawn within the U. K., and payable out of the U. K.

The Act 17th and 18th Vict., cap. 83, § 3, directs that

the duties on bills of exchange shall be denoted by adhesive stamps, to be furnished by the Commissioners of Inland Revenue.

Bills of exchange purporting to be drawn at any place out of the United Kingdom are to be deemed to be foreign bills, and are to be liable to the stamp-duty on such bills, though they may, in fact, have been drawn in the United Kingdom.—§ 4.

The holders of foreign bills, or bills drawn out of the United Kingdom, are to affix proper adhesive stamps to the same before negotiating them, under a penalty of L.50.—§ 5.

No one acquainted with the fundamental rules of arithmetic can have any difficulty whatever in estimating how much a sum of money in one country is worth in another, according to the state of the exchange at the time. The common arithmetical books abound in examples of such computations. But in conducting the business of exchange a direct remittance is not always preferred. When a merchant in London, for example, means to discharge a debt due by him in Paris, it is his business to ascertain not only the state of the direct exchange between London and Paris, and, consequently, the sum which he must pay in London for a bill on Paris equivalent to his debt, but also the state of the exchange between London and Hamburg, Hamburg and Paris, &c.; for it frequently happens that it may be more advantageous for him to buy a bill on Hamburg, Amsterdam, or Lisbon, and to direct his agent to invest the proceeds in a bill on Paris, rather than remit directly to the latter. This is termed the ARBITRATION of exchange. An example or two will suffice to show the principle on which it is conducted.

Thus, if the exchange between London and Amsterdam be 35s. Flemish (old coinage) per pound sterling, and between Paris and Amsterdam 1s. 6d. Flemish per franc, then, in order to ascertain whether a direct or indirect remittance to Paris would be most advantageous, we must calculate what would be the value of the franc in English money if the remittance were made through Holland; for if it be less than that resulting from the direct exchange, it will obviously be the preferable mode of remitting. This is determined by stating, as 35s. Flem. (the Amsterdam currency in a pound sterling): 1s. 6d. Flem. (Amsterdam currency in a franc) : : L.1 : 10d. the proportional or *arbitrated* value of the franc.—Hence, if the English money, or bill of exchange, to pay a debt in Paris, were remitted by Amsterdam, it would require 10d. to discharge a debt of a franc, or L.1 to discharge a debt of 24 francs: and therefore, if the exchange between London and Paris were at 24, it would be indifferent to the English merchant whether he remitted directly to Paris, or indirectly *viâ* Amsterdam; but if the exchange between London and Paris were *above* 24, then a direct remittance would be preferable; while, if, on the other hand, the direct exchange were less than 24, the indirect remittance ought as plainly to be preferred.

"Suppose," to borrow an example from Kelly (*Universal Cambist*, vol. ii., p. 137), "the exchange of London and Lisbon to be at 68d. per milree, and that of Lisbon on Madrid 500 rees per dollar, the arbitrated price between London and Madrid is 34d. sterling per dollar; for, as 1000 rees : 68d. : : 500 rees : 34d. But if the direct exchange of London on Madrid be 35d. sterling per dollar, then London, by remitting directly to Madrid, must pay 35d. for every dollar; whereas, by remitting through Lisbon, he will pay only 34d.: it is therefore the interest of London to remit indirectly to Madrid through Lisbon. On the other hand, if London draws directly on Madrid, he will receive 35d. sterling per dollar; whereas, by drawing indirectly through Lisbon, he would receive only 34d.; it is therefore the interest of London to draw directly on Madrid. Hence the following rules:—

"1. Where the certain price is given, draw through the place which produces the lowest arbitrated price, and remit through that which produces the highest.

"2. Where the uncertain price is given, draw through that place which produces the highest arbitrated price, and remit through that which produces the lowest."

In compound arbitration, or when more than three places are concerned, then, in order to find how much a remittance passing through them all will amount to in the last place, or, which is the same thing, to find the arbitrated price between the first and the last, we have only to repeat the different statements in the same manner as in the foregoing examples.

Thus, if the exchange between London and Amsterdam be 35s. Flem. for L.1 sterling; between Amsterdam and Lisbon 42d. Flem. for 1 old crusade; and between Lisbon and Paris 480 rees for 3 francs: what is the arbitrated price between London and Paris?

In the first place, as 35s. Flem. : L.1 : : 42d. Flem. : 2s. sterling = 1 old crusade.

Second, as 1 old crusade, or 400 rees : 2s. sterling : : 480 rees : 2s. 4·8d. sterling = 3 francs.

Third, as 2s. 4·8d. sterling : 3 francs : : L.1 sterling : 25 francs, the arbitrated price of the pound sterling between London and Paris.

This operation may be abridged as follows:—

		L.1 sterling.
L.1 sterling	=	35s. Flemish.
$3\frac{1}{2}$ shillings Flem.	=	1 old crusade.
1 old crusade	=	400 rees.
480 rees	=	3 francs.

$$\text{Hence } \frac{35 \times 400 \times 3}{480 \times 3\frac{1}{2}} = \frac{4200}{168} = 25 \text{ francs.}$$

This abridged operation evidently consists in aranging the terms so that those which would form the divisors in continued statements in the Rule of Three are multiplied together for a common divisor, and the other terms for a common dividend. The ordinary arithmetical books abound with examples of such operations.

The following account of the manner in which a very large transaction was actually conducted by indirect remittances, will sufficiently illustrate the principles we have been endeavouring to explain.

In 1804, Spain was bound to pay to France a large subsidy; and, in order to do this, three distinct methods presented themselves:—

1. To send dollars to Paris by land.
2. To remit bills of exchange directly to Paris.
3. To authorise Paris to draw directly on Spain.

The first of these methods was tried, but it was found too slow and expensive; and the second and third plans were considered likely to turn the exchange against Spain. The following method by the indirect or circular exchange was therefore adopted.

A merchant or *banquier* at Paris was appointed to manage the operation, which he thus conducted:—He chose London, Amsterdam, Hamburg, Cadiz, Madrid, and Paris, as the principal hinges on which the operation was to turn; and he engaged correspondents in each of these cities to support the circulation. Madrid and Cadiz were the places in Spain from whence remittances were to be made; and dollars were, of course, to be sent to where they bore the highest price, for which bills were to be procured on Paris, or on any other places that might be deemed more advantageous.

The principle being thus established, it only remained to regulate the extent of the operation, so as not to issue too much paper on Spain, and to give the circulation as much support as possible from real business. With this view, London was chosen as a place to which the operation might be chiefly directed, as the price of dollars was then high in England; a circumstance which rendered the proportional exchange advantageous to Spain.

The business was commenced at Paris, where the negotiation of drafts issued on Hamburg and Amsterdam served to answer the immediate demands of the state; and orders were transmitted to these places to draw for the reimbursements on London, Madrid, or Cadiz, according as the course of exchange was most favourable. The proceedings were all conducted with judgment, and attended with complete success. At the commencement of the operation, the course of exchange of Cadiz on London was 36d.; but by the plan adopted, Spain got $39\frac{1}{2}$d., or above 8 *per cent.* by the remittance of dollars to London, and considerable advantages were also gained by the circulation of bills through the several places on the Continent.—(*Kelly's Cambist*, vol. ii., p. 168; *Dubost's Elements of Commerce*, 2d ed., p. 228.)

 Table specifying the Value of the Monies of Account of the principal Places with which this Country has Exchange Transactions, taking Silver at 5s. an oz., and specifying also the Par *of Exchange with such Places on this Hypothesis.*—(Abstracted from *Tate's Modern Cambist,* to which the reader is referred for farther explanations.) Exchange.

							Par of Exchange.		
Petersburg	100 copecks	=	1 rouble	=	3s. $1\frac{1}{2}$d.	giving	6 roub. 40 cop.	=	L.1
Berlin	30 sil. groschen	=	1 Pruss. doll.	=	2s. $10\frac{3}{4}$d.	—	6 doll. 27 s. g.	=	1
Copenhagen	96 skillings	=	1 Rig. doll.	=	2s. $2\frac{1}{3}$d.	—	9 doll. 10 sk.	=	1
Hamburg	16 schillings	=	1 mark	=	1s. $5\frac{1}{2}$d.	—	13 mks. $10\frac{1}{2}$ sch.	=	1
Amsterdam	100 centimes	=	1 florin	=	1s. 8d.	—	11 fl. 97 cents	=	1
Antwerp	100 centimes	=	1 florin	=	1s. 8d.	—	11 fl. 97 cents	=	1
Paris	100 centimes	=	1 franc	=	$9\frac{1}{2}$d.	—	25 fr. 57 cents	=	1
Frankfort	$24\frac{1}{2}$ guld. or flor.	=	1 mark	=	1s. $7\frac{7}{8}$d.	—	$12\frac{3}{40}$ guldens	=	1
Vienna	60 kreusers	=	1 florin	=	2s. $0\frac{4}{10}$d.	—	9 fl. 50 kr.	=	1
Venice	100 centisimi	=	1 lira Austriaca	=	8·13d.	—	29 li. 52 cent.	=	1
Genoa	100 centisimi	=	1 lira Nuova	=	$9\frac{1}{2}$d.	—	25 li. 57 cent.	=	1
Leghorn	100 centisimi	=	1 lira Toscana	=	7·82d.	—	30 li. 69 cent.	=	1
Madrid	8 reals	=	1 dollar of Plate	=	3s. $1\frac{3}{4}$d.	—	6 doll. $2\frac{3}{4}$ reals	=	1
Lisbon	1000 reis	=	1 milreis	=	4s. 8d.	—	4 mil. 285 reis	=	1
New York	100 cents	=	1 dollar	=	4s. 2d.	—	4 doll. 80 cents	=	1
Rio Janeiro	1000 reis	=	1 milreis	=	2s. 7d.	—	7 mill. 777 reis	=	1
Havannah	100 cents	=	1 dollar	=	4s. $6\frac{13}{222}$d.	—	4 doll. 44 cents	=	1

It is easy from this table to calculate the value of any of the above coins, taking silver at 5s. 2d., 5s. 6d. an oz., or any other price, and thence to deduce the par of exchange at such rates.

LAW OF BILLS OF EXCHANGE.

The chief legal privileges appertaining to bills are, first, that though only a simple contract, yet they are always presumed to have been originally given for a good and valuable consideration; and, secondly, they are assignable to a third person not named in the bill or party to the contract, so as to vest in the assignee a right of action, in his own name; which right of action, no release by the drawer to the acceptor, nor set-off or cross demand due from the former to the latter, can affect.

All persons, whether merchants or not, being legally qualified to contract, may be parties to a bill. But no action can be supported against a person incapable of binding himself, on a bill drawn, indorsed, or accepted by such incapacitated person; at the same time the bill is good against all other competent parties thereto.

Bills may be drawn, accepted, or indorsed by the party's agent or attorney verbally authorized for the purpose. When a person has such authority, he must either write the name of his principal, or state in writing that he draws, &c., as agent, thus: "per procuration, for A. B."

Where one of several partners accepts a bill drawn on the firm, for himself and partners, or in his own name only, such acceptance binds the partnership if it concerns the trade. But the acceptance of one of several partners on behalf of himself and partners, will not bind the others, if it concern the acceptor only in a separate and distinct interest; and the holder of the bill, at the time he becomes so, was aware of that circumstance. If, however, he be a *bona fide* holder for a sufficient consideration, and had no such knowledge at the time he first became possessed of the bill, no subsequently acquired knowledge of the misconduct of the partner in giving such security will prevent him from recovering on such bills against all the partners.

Although no precise form of words is required to constitute a bill of exchange or promissory note, yet it is necessary that it should be *payable at all events,* and not depend on any contingency; and that it be made for the payment of money only, and not for payment of money and performance of some other act, as the delivery of a horse, or the like.

If, however, the event on which the payment is to depend must inevitably happen, it is of no importance how long the payment may be in suspense; so a bill is negotiable and valid if drawn payable six weeks after the death of the drawer's father, or payable to an infant when he shall become of age.

Any material alteration of a bill after it has been drawn, accepted, or indorsed, such as the date, sum, or time of payment, will invalidate it; but the mere correction of a mistake, as by inserting the words "or order," will have no such effect.

The negotiability of a bill depends on the insertion of sufficient operative words of transfer; such as by making it payable to A. or order, or to A. or bearer, or to bearer generally.

Although a bill is presumed to have been originally drawn upon a good and valuable consideration, yet in certain cases a want of sufficient consideration may be insisted on in defence to an action on a bill. Certain considerations have been made illegal by statute; as for signing a bankrupt's certificate, for money won at gaming, or for money lent on a usurious contract. But with respect to gaming, it is held that a bill founded on a gambling transaction is good in the hands of a *bona fide* holder; and by 58th Geo. III., cap. 93, a bill or note in the hands of an innocent holder, although originally founded on a usurious contract, is not invalid.

In general, if a bill is fair and legal in its origin, a subsequent illegal contract or consideration on the indorsement thereof will not invalidate it in the hands of a *bona fide* holder.

A bill cannot be given in evidence in a court of justice, unless it be duly stamped, not only with a stamp of the proper value, but also of the proper denomination.

Acceptance of a Bill.—An acceptance is an engagement to pay a bill according to the tenor of the acceptance, which may be either *absolute* or *qualified.* An *absolute* acceptance is an engagement to pay a bill according to its request, which is done by the drawee writing "Accepted" on the bill, and subscribing his name, or writing "Accepted" only; or merely subscribing his name at the bottom or across the bill. A *qualified* acceptance is when a bill is accepted conditionally; as when goods conveyed to the drawee are sold, or when a navy bill is paid, or other future event which does not bind the acceptor till the contingency has happened.

An acceptance may be also partial; as to pay L.100 instead of L.150, or to pay at a different time or place from that required by the bill. But in all cases of a conditional or partial acceptance, the holder should, if he mean to resort to the other parties to the bill in default of payment, give notice to them of such partial or conditional acceptance.

In all cases of presenting a bill for acceptance, it is necessary to present the bill at the house where the drawee lives, or where it is made payable. By 1st and 2d Geo. IV., cap. 78, all bills accepted payable at a banker's or other place are to be deemed a general acceptance; but if they are accepted payable at a banker's "only and not otherwise or elsewhere," it is a qualified acceptance, and the acceptor is not liable to pay the bill, except in default of payment when such payment shall have been first demanded at the banker's. The drawee is entitled to keep the bill twenty-four hours when presented for acceptance. The acceptance of an inland bill must be *in writing on the face of the bill,* or if there be more parts than one, on one of such parts; nothing short of this constitutes a valid acceptance.

When a bill is made payable *at sight,* or at a certain time *after sight,* it must, in either case, in order to fix the time when it is to be paid, be presented for acceptance; and the date of the acceptance should appear thus: "Accepted, 10th May 1855."

Due diligence is the only thing to be considered in presenting any description of bill for acceptance; and such diligence is a question depending on the situation of the parties, the distance at which they live, and the facility of communication between them.

When the drawee refuses to accept, any third party, after protesting, may accept for the honour of the bill generally, or for the drawee, or for the indorser; in which case the acceptance is called an acceptance *supra protest.*

The drawers and indorsers are discharged from liability, unless due notice of non-acceptance when presented for acceptance, or non-payment at the time the bill becomes due, is given. These notices must be given with all due diligence to all the parties to whom the holder means to resort for payment. Generally, in both foreign and inland bills, notice is given next day to the immediate indorser, and such indorser is allowed a day, when he should give fresh notice to the parties who are liable to him.

Notice may be sent by the post, however near the residence of the parties may be to each other; and though the letter containing such notice should miscarry, yet it will be sufficient; but the letter containing the notice should be delivered at the General Post Office, or at a receiving-house appointed by that office, not to the bellman

in the street. In all cases of notice, notice to one of several parties is held to be notice to all; and if one of several drawers be also the acceptor, it is not necessary to give notice to the other drawers.

Upon the non-acceptance or non-payment of a bill, the holder, or a public notary for him, should protest it; that is, draw up a notice of the refusal to accept or pay the bill, and the declaration of the holder against sustaining loss thereby. Inland bills need not be protested; in practice they are usually only noted for non-acceptance; but this, without the protest, is wholly futile, and adds nothing whatever to the evidence of the holder, while it entails a useless expense on those liable to pay.

Indorsement of Bills.—An indorsement is the act by which the holder of a negotiable instrument transfers his right to another person, termed the indorsee. It is usually made on the back of a bill, and must be in writing; but the law has not prescribed any set form of words as necessary to the ceremony, and in general the mere signature of the indorser is sufficient.

All bills payable to order or to bearer for L.1 and upwards are negotiable by indorsement; and the transfer of them for a good consideration before they are payable gives a right of action against all the precedent parties on the bill, if the bills in themselves are valid; but a transfer after they are due will only place the holder in the situation of the person from whom he takes them.

Bills may be transferred either by delivery only, or by indorsement and delivery; bills payable to order are transferred by the latter mode only; but bills payable to bearer may be transferred by either mode. On a transfer by delivery, the person making it ceases to be a party to the bill; but on a transfer by indorsement, he is to all intents and purposes chargeable as a new drawer.

A bill originally transferable may be restrained by restrictive words; for the payee or indorsee, having the absolute property in the bill, may, by express words, restrict its currency, by indorsing it "Payable to A. B. only," or "to A. B. for his use," or any other words clearly demonstrating his intention to make a restrictive and limited indorsement. Such special indorsement precludes the person in whose favour it is made from making a transfer, so as to give a right of action against the special indorser, or any of the precedent parties to the bill.

In taking bills to account or discount, it is important well to examine all special indorsements. Lord Tenterden decided that a person who discounts a bill indorsed "Pay to A. B. or order *for my use*," discounts it subject to the risk of having to pay the money to the special indorser, who so limited the application *for my use;* thus a party may be liable to pay the amount of the bill twice over, unless he previously ascertains that the payment has been made conformably to the import of the indorsement.

After the payment of part, a bill may be indorsed over for the residue.

Presentment for Payment.—The holder of a bill must be careful to present it for payment at the time when due, or the drawer and indorsers will be exonerated from their liability; even the bankruptcy, insolvency, or death of the acceptor, will not excuse a neglect to make presentment to the assignees or executor; nor will the insufficiency of a bill in any respect constitute an excuse for non-presentment: the presentment should be made at a reasonable time of the day when the bill is due; and if by the known custom of any trade or place bills are payable only within particular hours, a presentment must be within those hours. If a bill has a qualified acceptance, the presentment should be at the place mentioned in such qualified acceptance, or all the parties will be discharged from their obligations.

If a bill fall due on Sunday, Good Friday, Christmas Day, or any public fast or thanksgiving day, the presentment must be on the day preceding these holidays. By 7th and 8th Geo. IV., cap. 15, if a bill or note be payable on the day preceding these holidays, notice of the dishonour may be given the day following the holiday; and if Christmas Day fall on Monday, notice may be given on Tuesday.

Bills, however, payable at usance, or at a certain time after date or sight, or after demand, ought not to be presented for payment precisely at the expiration of the time mentioned in the bills, but at the expiration of what are termed *days of grace.* The days of grace allowed vary in different countries, and ought always to be computed according to the usage of the place where the bill is due. In some countries, as in France, they have been abolished. At Hamburg, the day on which the bill falls due makes one of the days of grace; but nowhere else.

On bills payable on demand, or when no time of payment is expressed, no days of grace are allowed; but they are payable instantly on presentment. On bank post bills no days of grace are claimed; but on bills payable at sight the usual days of grace are allowed from the sight or demand, as notified by the date of the acceptance.

Payment of a bill should be made only to the holder; and it may be refused unless the bill be produced and delivered up. On payment, a receipt should be written on the back; and when a part is paid, the same should be acknowledged upon the bill, or the party paying may be liable to pay the amount a second time to a *bona fide* indorser.

Promissory Notes and Checks.—The chief distinction between promissory notes and bills of exchange is, that the former are a direct engagement by the drawer to pay them according to their tenor, without the intervention of a third party as a drawee or acceptor. Promissory notes may be drawn payable on demand to a person named therein, or to order, or to bearer generally. They are assignable and indorsable; and in all respects so nearly assimilated to bills, that the laws which have been stated as bearing upon the latter may be generally understood as applicable to the former. It has been decided, in case an instrument is drawn so equivocally as to render it uncertain whether it be a bill of exchange or promissory note, the holder may treat it as either against the drawer.

The issue of any promissory note payable to bearer on demand for a less sum than L.5 by the Bank of England, or any licensed English banker, is prohibited; and by 9th Geo. IV., cap. 65, it is provided, that no corporation or person shall utter or negotiate, in England, any such note which has been made or issued in Scotland, Ireland, or elsewhere, under a penalty not exceeding L.20 nor less than L.5. But this does not extend to any draft or order on bankers for the use of the drawer.

A *check or draft* is as negotiable as a bill of exchange, and vests in the assignee the same right of action against the assignor. If not presented within a reasonable time, payment may be refused.

Unstamped drafts or orders for any sum of money payable to bearer on demand, may be drawn upon bankers, or persons acting as such, provided the place where they transact business, or where the drafts or orders are to be paid, be within 15 miles of the place where they are issued. But all such drafts or orders when remitted or sent to any greater distance than 15 miles from their place of issue, must be duly stamped under a penalty of L.50 (17th and 18th Vict., cap. 83, sect. 6).

Any person making, accepting, or paying any bill, draft, order, or promissory note, not duly stamped, is liable to a penalty of L.50; for post-dating them, L.100; and for not truly specifying the place where unstamped drafts are issued, L.100; and any person knowingly receiving such unstamped draft, L.20; and the banker knowingly paying it, L.100; besides not being allowed such sum in account.

It used to be of especial importance to bankers and others taking bills and notes, that they should not only be aware of the responsibility of the acceptors and other parties to such bills and notes, but that they should have some knowledge of those from whom they received them; for, if the instrument turned out to have been lost or fraudulently obtained, they might be deprived of their security, on an action by the owner to recover possession. Lord Tenterden decided, "if a person take a bill, note, or any other kind of security, under circumstances which ought to excite suspicion in the mind of any reasonable man acquainted with the ordinary affairs of life, and which ought to put him on his guard to make the necessary inquiries, and he do not, then he loses the right of maintaining possession of the instrument against the rightful owner."—(*Guildhall*, Oct. 25, 1826.) But it has since been decided, in contravention of this doctrine, that the claim of the *bona fide* holder of a bill or note that has been lost or stolen is not invalidated by the want of the suspicions or inquiries referred to by Lord Tenterden, or even by gross negligence; and that to defeat the holder's claim it must be shown that he took the instrument *mala fide.*—(*Chitty on Bills*, 9th ed. p. 257.) This is not only an important, but, as we think, a sound decision: it facilitates the negotiation of bills, and clears up and gives precision to the law.

Before concluding this article on mercantile paper, it may not be improper to introduce one or two cautions with regard to acceptances, and accommodation paper, and proceedings in case of the loss of bills.

First, A man should not put his name as acceptor to a bill of exchange without well considering whether he has the means of paying the same when due, as otherwise he may be liable not only to the costs of the action against himself, but also to the costs of the action against the other parties to the bill: the shrewd tradesman is generally anxious to get the acceptance of his debtor at a short date, well knowing that it not only fixes the amount of the debt, but is more speedily recoverable by legal procedure than a book debt.

Secondly, Traders who wish to support their respectability, and desire to succeed in business, should be cautious in resorting to what is called the system of cross-accommodation acceptances: it seldom ends well, and usually excites suspicion as to the integrity of the parties; it being an expedient often adopted by swindlers to defraud the public. Independent of the expense in stamps and discounts, and frequently in noting, interest, and law expenses, the

danger attending such accommodation is sufficient to deter from the practice. Suppose, for instance, A. and B. mutually accommodate each other to the amount of L.1000, the acceptances being in the hands of third persons; both A. and B. are liable to such third persons to the extent of L.2000 each; and should A. by any unforseen occurrence be suddenly rendered unable to meet his acceptances, the holders of the whole, as well the acceptances of A. as the acceptances of B., will resort to B. for payment; and it may so happen, that although B. could have provided for his own share of the accommodation paper, he may be unable to provide for the whole, and may thus become insolvent.

Lastly, In case of the loss of a bill, the 9th and 10th Will. III., cap. 17, provides, that if any inland bill be lost or missing within the time limited for its payment, the drawer shall, on sufficient security given to indemnify him if such bill be found again give another bill of the same tenor with the first. (J. R. M.)

EXCHANGE also signifies a place in most considerable trading cities where merchants, agents, bankers, brokers, interpreters, and other persons concerned in commerce, assemble on certain days, at a fixed hour, to confer together in regard to matters relating to exchanges, remittances, payments, assurances, freights, &c. In Flanders, Holland, and France, these places are called *Bourses*, or *Places de Change;* and in the Hanse Towns, *Borsenhalle.* The most considerable exchanges in Europe are those of London, Paris, and Amsterdam.

The ancient Romans had places for merchants to meet in most of the considerable cities of their empire. That which is said to have been built at Rome in the year B.C. 493 was called *Collegium Mercatorum,* of which it is alleged there are still some remains, called by the modern Romans *Loggia,* the Lodge, or place of St George.

EXCHEQUER BILLS are bills of credit issued by authority of parliament. They are, for various sums, and bear interest (generally from 1½d. to 2½d. per diem, per L.100) according to the usual rate at the time. The advances of the Bank to government are made upon Exchequer bills; and the daily transctions between the Bank and government are principally carried on through their intervention. Notice of the time at which outstanding Exchequer bills are to be paid off is given by public advertisement. Bankers prefer vesting in Exchequer bills to any other species of stock, even though the interest be for the most part comparatively low; because the capital may be received at the treasury at the rate originally paid for it, the holders being exempted from any risk of fluctuation, except in the amount of the premium or discount at which they may have bought the bills. Exchequer bills were first issued in 1696, and have been annually issued ever since. The subjoined is an account of the unfunded debt in Exchequer bills, and of the annual charge thereon, on the 5th of January 1817, and on the 5th of January in every subsequent year down to 1855.

Years ending Jan. 5.	Amount of Exchequer Bills.	Rate of Interest per Diem.	Charge of Interest per Annum.
	L.		L.
1817	44,650,300	3d. Nov. 22, 1816	2,173,927

The interest paid within each year is given in the column of charge, which interest has accrued upon the capital stated in the preceding year.

The interest upon the L.16,029,600, and upon L.1,750,000 of bills issued in April 1854, will be paid in 1855.

The interest upon the L.17,183,000, will not be payable till 1856, *i. e.*, year ending January 5, 1857.

In 1853 *Exchequer bonds* were issued bearing interest at 2¾ per cent. for ten years, and thereafter 2½ per cent. for thirty years, or till 1894, to such holders of South Sea, and 3 per cent. stock as chose to accept the same, a bond for L.100 being given for every L.100 stock subscribed (16th and 17th Vict., cap. 23). But only a very small sum (L.5000) has been invested in such bonds. (J. R. M.)

EXCHEQUER, COURT OF, an ancient court of record, so called from the chequered cloth, resembling a chess-board, which covered the table. This court was derived from the Normans, and was at first intended principally to order the revenues of the Crown, and to recover the king's debts and duties. The judges were styled *Barones Scaccarii,* and the court was anciently held in the king's palace. The common-law part of their jurisdiction was acquired by usurpation, as at first it was merely for the benefit of the king's accountants, but afterwards a legal fiction obtained whereby the plaintiff suggested he was the king's debtor, *quominus sufficiens existit:* by which he was less able to pay the king his debt. This suggestion not being controverted, the court became an ordinary court of justice between subject and subject, and at length by the Uniformity of Process Act, 2d Will. IV., cap. 39, a direct and proper jurisdiction was given without resorting to the legal fiction. There are two divisions of the court—the receipt of the Exchequer, managing the royal revenues,

and the judicial part of the court. Formerly the court of exchequer had power and jurisdiction as a court of equity, but the act 5th Vict., cap. 5, transferred this power to the court of chancery.

As a court of revenue it ascertains and enforces the rights of the crown against subjects, and as a court of common law it takes cognizance of all personal actions like the other courts, with the exception of a few species of real actions. There are at present five judges, the lord chief baron and four puisné barons. An appeal lies from the decision of this court to the court of exchequer chamber. The Chancellor of the Exchequer is the treasurer, and holds the seal of the court.

EXCHEQUER CHAMBER, Court of, was erected in England by the 31st Edw. III., cap. 12, to determine causes on writs of error from the common-law side of the court of exchequer, and consisted of the lord chancellor, the lord treasurer, and the justices of the king's bench and common pleas. By the 27th Eliz., cap. 8, a second court was established, consisting of the justices of the common pleas and the barons of the exchequer, to determine appeals from the king's bench. A new arrangement was made by the 11th Geo. IV., and 1 Will. IV., cap. 70, § 8, whereby the judgments of each of the superior common-law courts are subject to revision by the judges of the other two sitting as a court of error in the exchequer chamber. An appeal lies from this court to the House of Lords.

Exchequer, in Scotland. See Scotland.

EXCISE (most probably from the Latin *excidere, to cut off*), a term used in finance to signify a duty charged in a country upon articles produced in it before they are permitted to get into the possession of the public.

Some articles are much better suited than others for being subjected to excise duties. But they have been imposed on a great variety of articles, and have, for a lengthened period, furnished a large portion of the public revenue of most European countries.

Excise duties have, indeed, existed in one form or other in all modern, and perhaps also in all ancient, states. They were introduced into Rome by Augustus, who imposed a duty of one per cent. (*centesima rerum venalium*) on all articles, whether great or small, sold in public markets or by auction. Though extremely moderate, a duty of this sort could not fail, from the difficulties in the way of its assessment, its interference with the dealings of individuals, and the abuses to which it must have led, to occasion clamour and discontent. And these in no long time became so very prevalent, that Tiberius was obliged to declare that the maintenance of the army, for the support of which this tax had been appropriated, depended on its being continued. (Taciti *Annal.*, lib. i., § 78.) In the sequel it underwent various changes. It appears to be sufficiently well established that it applied only to Rome, and, perhaps, to some few of the other great towns. In the smaller towns its produce would not indeed have sufficed to defray the cost of its collection. It, therefore, had at bottom a good deal in common with the *octrois* or town duties charged on commodities coming into Paris and other great continental cities. But the defective mode of its assessment must have made it infinitely more troublesome and onerous. (Gibbon, *Decline and Fall*, i. 211, ed. 1838; Dureau de la Malle, *Economie Politique des Romains*, ii. 459, &c.)

It is said that the first attempt to introduce excise duties into England was made in 1626 by a commission under the Great Seal. But parliament having remonstrated against the measure, the commission was cancelled. This description of duties had, however, been previously established in Holland, and the large revenue which they afforded pointed them out to the leaders of the popular party in the great civil war as the most likely means by which they could raise funds to carry on the arduous contest in which they had embarked. They were, consequently, introduced by a parliamentary ordinance issued in 1643, which imposed duties on ale, beer, cider, and perry, and on the makers and venders thereof. The Royalists soon after followed the example set by the Republicans; though, as the duties were from the outset exceedingly unpopular, both parties took especial care to ascribe their introduction to necessity, and to pledge themselves to their abolition at the close of the war. But they were soon found to be far too productive to be voluntarily abandoned; and after the nation had been accustomed to them for a few years, and they had been considerably increased, parliament did not hesitate to declare in 1649 that "the impost of excise was the most easy and indifferent levy that could be laid upon the people." (Blackstone, book i., cap. 8.) And it is worthy of remark that the regulations embodied in Cromwell's Excise Act of 1657, authorizing officers to make searches, and directing the giving of notices, &c., are very similar to those now in force.

The same reasons that made the excise be continued down to the Restoration, secured its existence subsequently to that epoch. A portion of its produce was, at the same time, assigned in perpetuity to the crown, in compensation for its relinquishing the hereditary revenues arising from wardships and other feudal prerogatives which were then abolished. And, notwithstanding Blackstone says that, "from its first original to the present time, its very name has been odious to the people of England" (Com. *ubi supra*), it has continued progressively to gain ground; and has, for a lengthened series of years, furnished a large portion of the public revenue.

It is probable that the prejudice to which Blackstone alludes did not originate so much in any dislike to the duties themselves as in the peculiar circumstances connected with their imposition. Originally they were let in farm, which is always a most unpopular proceeding. And down to a recent period there was hardly a single duty the assessment of which was not made the subject of numerous lengthened, obscure, and contradictory statutes, so that it was hardly possible for any trader, however desirous to comply with the law, to avoid getting into serious scrapes. The duties being frequently, also, carried to an oppressive extent, smuggling was practised; and when a party was prosecuted, whether for an intentional or unintentional infraction of the law, or for attempting to defraud the revenue, the case might be laid before judges (without the intervention of a jury) in whose decision the public had little confidence. No wonder, therefore, that the excise should have been unpopular. But the obnoxious practice of letting the duties to farmers has been long abandoned, and of late years the laws and regulations connected with their assessment have been much simplified. In this respect, indeed, nothing should be omitted to render the rules for assessing the duties brief, level to the comprehension of every one, and calculated to interfere as little as possible with the details and processes of manufacture. And, supposing their assessment to be sufficiently simplified, and that they are of a reasonable amount, but little objection can be made to the duties because of the summary jurisdiction exercised by the commissioners and justices. On the contrary, this practice has some material advantages. When parties are prosecuted in the court of exchequer for offences against the revenue, their case is, of course, submitted to a jury. But in this court, as in others, delays frequently take place, and the expenses are always very considerable; whereas, in cases of summary jurisdiction, or those adjudged by the commissioners and justices, there is little or no delay, and little or no expense. And, considering that all parties who fancy themselves aggrieved by the decision of the commissioners are entitled (4th Vict., cap.

20, sec. 26), to appeal at a very trifling cost to a baron of exchequer, who rejudges the case; while those who suppose themselves aggrieved by a sentence of the justices may appeal to the quarter-sessions (7th and 8th Geo. IV., cap. 53, sec. 82), there really appears to be more to approve than to object to in the summary jurisdiction.

The excise duties formerly imposed on salt, leather, candles, beer, glass, and other less important articles, have been repealed within these few years. And we doubt whether there be one of the existing duties which can be fairly objected to on principle, or for its injuriously interfering with the manufacture, or being too high. Whatever may have been the case formerly, the excise is now fully entitled to the eulogium passed upon it by Arthur Young, "Excises are by much the fairest, most equal, and least burdensome of all taxes. They are paid voluntarily. Not a shilling is contributed but in proportion to the free consumption. The Dutch, who have been deservedly esteemed the wisest nation in Europe in all matters of taxation, have been enabled to preserve their industry under burdens of which we have no experience and scarcely any conception, principally by their having adopted this mode of taxation" (*Political Arithmetic*, part ii., p. 46). For farther information in regard to the excise duties, see art. TAXATION in this work. (J. R. M.)

EXCLUSION, BILL OF, in English history, a bill proposed towards the close of the reign of Charles II., for excluding his brother, the Duke of York, from the throne, on account of his being a Papist.

EXCOMMUNICATION, an ecclesiastical censure, by which, till it be removed, a person is excluded from communion with his church. It is founded on the natural right which all societies have to exclude from their body such as contravene the established laws. Hence this power has been exercised wherever societies have existed—secular, spiritual, literary, &c. It was in use among the Jews, who, in certain cases, excluded persons from communion in the benefits of religious worship with the people. Excommunication, or the act of excluding from a participation in the mysteries of religion, was also in use under Paganism. Persons thus excommunicated were prohibited from assisting at or attending the sacrifices, or entering the temples, and were solemnly given over to the infernal deities with certain imprecations. This was called by the Romans *diris devovere*. Among the ancient Britons and Gauls the Druids likewise made use of excommunication against rebels, and interdicted from the communion of their mysteries such as refused to acquiesce in their decisions. Among the early Christians excommunication was instituted for the purpose of preserving the purity of the church, and enforcing its discipline. It was originally exercised by the whole community, but afterwards the right to excommunicate was confined to the bishops. This formidable power, however, soon came to be wielded with little discretion, and eventually ambitious ecclesiastics converted it into an engine for aggrandizing themselves, frequently inflicting it on the most frivolous pretences. In the Roman Church, since the time of Pope Gregory IX., there have existed two kinds or rather degrees of excommunication—the greater and the less. By the former, parties are deprived of the sacraments and benefit of divine offices, of the society and conversation of the faithful, and are denied Christian burial. In the case of an excommunicated sovereign, subjects were absolved from their allegiance, or even forbidden to obey him; though many ecclesiastical writers in later times maintained that the excommunication of a prince ought not to have any influence on matters of political administration—a condition no less necessary than convenient, when the relations between princes and people had assumed a character very different from what they had been during the middle ages. In those times of ignorance and superstition, the Pope reigned supreme over the consciences of men; and if he thought fit to excommunicate a city, province, or country, the consequences were felt as a calamity of the heaviest kind. All religious services ceased; there was no regular burial, no ringing of the bells, &c., and relics and crucifixes lost their supposed efficacy. Of such excommunication or *interdicts* (as these are called when issued against a whole country), the first was that which Gregory V. pronounced against France, in the year 998, because King Robert refused to put away his lawful wife; and such were its consequences that the king was at last compelled to yield. But still more memorable is that issued against England by Innocent III., because King John refused to pay the tribute called Peter's-pence, and to acknowledge the Pope's right of nominating to the English bishoprics. In the end, however, John was obliged to yield, and received back his kingdom as a Papal fief. The excommunication of Henry VIII., too, is famous in history. No country has suffered so severely from interdicts as Germany, revolutions having frequently been the consequence of excommunications issued against the emperors. The latest instance of the excommunication of a sovereign, was that of Napoleon by Pius VII. in 1809. The Romanists use the phrase *fulminating an excommunication*, to signify the solemn denunciation after several admonitions; and the excommunication thus pronounced is called *anathema*. The ceremonies attending these fulminations are of a terrible character, and appear to have been first used in the eleventh century. The less excommunication only excluded from a participation in the sacraments and divine worship, and this is the sense in which the term is commonly used. This sentence is passed by judges ecclesiastical on such persons as are guilty of obstinacy or disobedience in not appearing upon a citation, or not submitting to penance or other injunctions of the court.

Excommunication, as a means of punishment, was introduced at an early period into England; and the English Church retains a form of excommunication in cases of adultery, heresy, simony, neglect of public worship, &c., but the use of it is now almost obsolete. Blackstone remarks that "heavy as the penalty of excommunication is, considered in a serious light, there are notwithstanding many obstinate or profligate men who would despise the *brutum fulmen* of mere ecclesiastical censures, especially when pronounced by a petty surrogate in the country, for railing or contumacious words, for non-payment of fees or costs, or other trivial causes. The common law, therefore, compassionately steps in to the aid of the ecclesiastical jurisdiction, and kindly lends a supporting hand to an otherwise tottering authority. This was done by the writ called *de excommunicato capiendo;* but by act 53d Geo. III., cap. 127, "no person who shall be pronounced or declared excommunicate (pursuant to the second clause of this statute) shall incur any civil penalty or incapacity in consequence of such excommunication, save such imprisonment, not exceeding six months, as the court pronouncing or declaring such person excommunicate shall direct." By the same act, a writ *de contumace capiendo*, which in effect is the same as the old writ *de excommunicato capiendo*, shall issue in all cases in ecclesiastical courts when a person shall refuse to appear, when cited by such court, or refuse to obey its decree, except in certain cases, as spiritual censures for offences of ecclesiastical cognizance.

EXCUBIÆ, in *Roman Antiquity*, denotes the watches in the camp, whether by day or night. The term *vigiliæ*, again, was restricted to the night-watches. *Excubiæ* and *vigiliæ* were also applied respectively to the individuals who performed such duty. The guards placed before the gates were properly called *stationes;* and those on the ramparts *custodiæ*. If a sentinel deserted his post he was punished with death. See ARMY, § *Roman Army*.

EXCUSATI, in *Ecclesiastical History*, a term used to denote slaves who, having fled to any church for sanctuary, were excused and pardoned by their masters; but the latter were obliged to take an oath to this effect before they could recover the fugitives; and if they broke it, they were punished and fined for perjury.

EXECRATION (*ex* and *sacer*), malediction; imprecation of evil. Among the ancient Jews, Greeks, Romans, and some other nations, it was customary to pronounce imprecations upon their enemies for the purpose of calling down the divine wrath, branding them with infamy, and exciting against them the passions of the multitude. By such means they also devoted their enemies to the ruin they considered them to deserve. Thus the Athenians proceeded against Philip of Macedon. They convened an assembly, in which it was decreed that all statues, inscriptions, or festivals in any way relating to him or his ancestors, should be destroyed, and every other possible reminiscence of him be profaned; and the priests, as often as they prayed for the success of the Athenian affairs, should pray for the ruin of Philip. It was also customary, after having destroyed cities in war, the revival of whose strength was dreaded, to pronounce execrations against those who should rebuild them. Execrations were sometimes pronounced upon cities before undertaking a siege, and before engaging with enemies in battle. Tacitus relates (*Annal.*, xiv. 29), that the priestesses of ancient Britain devoted their Roman invaders to destruction, with imprecations, ceremonies, and attitudes, which for a time overwhelmed the soldiers with terror.

EXECUTION, in a general sense, denotes performance or accomplishment. In law it signifies the putting the sentence of the law in force after the decision of a suit. This is done at common law by the following writs:—

1. By *capias ad satisfaciendum*, which is to imprison the body of the debtor until satisfaction be made for the debt or damages and costs. This writ does not lie against privileged persons, peers or members of parliament, nor can it be executed on a Sunday; and since the 7th and 8th Vict., cap. 96, sect. 58, it can only issue where the debt is above L.20. The debtor, when taken under this process, must remain in custody until he settles the debt or is otherwise lawfully discharged as an insolvent.

2. By *fieri facias*, which issues against the goods and chattels of the debtor, and lies against all persons without exception. There are certain restrictions and enactments as to the things liable to be seized, imposed by the several statutes of 8th Anne, cap. 14, 56th Geo. III., cap. 50, 1st and 2d Vict., cap. 110, sect. 12, and 14th and 15th Vict., cap. 25, sect. 2. Under these statutes, the landlord is first entitled to a year's rent; and the removal of hay, &c., is in certain cases excepted. This process may, since the 15th and 16th Vict., cap. 76, sect. 120, and rule 57 of Hilary Term 1853, issue within 14 days after trial unless the judge shall otherwise order. And under the 7th Geo. IV., cap. 46, sect. 13, the execution on any judgment against the public officer of any joint-stock bank may issue against any member for the time being, and if ineffectual, against any person who was a member at or before the time of the contract or judgment obtained, provided he has not ceased to be a member for three years.

3. By *levari facias*, which commands the sheriff to levy the debt on the land. This writ is now chiefly used against ecclesiastics, under which the bishop enters into the benefice and sequesters the same until the amount of the debt is levied.

4. By *elegit*, which was given by the 13th Edw. I., cap. 18, and has since been extended by the 1st and 2d Vict., cap. 110. Under this writ, the sheriff delivers execution of all the debtor's lands, tenements, and hereditaments; and it is of so high a nature, that after its issue the defendant's body cannot be taken, although after a *fieri facias* the body may be so taken.

In the *County Courts*, execution against the goods of a defendant is regulated by the 9th and 10th Vict., cap. 95, sect. 94; and that against the person by sect. 98.

In *Chancery*, this writ formerly issued to compel obedience to a decree or order, but it was abolished by the 10th general order of April 11, 1842, and mere service of the decree or order was substituted.

The last stage in *criminal* proceedings is also called execution—the completion of human punishment. This in all cases must be performed by the sheriff or his deputy within a convenient time, which before the 6th and 7th Will. IV., cap. 30, was on the day next but one after the sentence, unless it fell on a Sunday, and in that case on the Monday following. The universal mode in England is now that the prisoner be hanged by the neck till dead.

Improved legislation, together with the advance of civilisation, have done much to diminish the frequency of this extreme penalty of the law; and a strong public feeling now exists in favour of its total abolition. During the three years ending with 1820, the number of executions in England and Wales was 312; in the three years ending 1830 the number had decreased to 178; and in the three years ending 1840, to 62. The total number of executions in the United Kingdom in 1850 was only 16, of which *eight* took place in Ireland.

EXECUTIVE, in the theory of government, a term used in co-relation to *legislative* and *judicial*. The powers that enact laws are the legislative; those that apply them in particular cases are the judicial; those that carry them into effect and superintend their practical operation are the executive. In England, the executive is, by the constitution, supposed to be vested in the king and such inferior officers as he may appoint.

EXECUTOR, in *Law*, is one to whom is committed the duty of administering the moveable estate of a deceased person for the behoof of all concerned therein. In Scots law, executors are either *nominate*, *i.e.*, appointed by will, or *dative*, *i.e.*, appointed by the court. In English law, the term executor properly belongs only to the former of these, the latter being called administrators. Executors-dative and administrators are appointed when none have been nominated by will, or when those so nominated refuse to act. They differ from executors-nominate chiefly in the manner of their appointment; their duties are in general the same. The right to nomination as executors-dative or administrators is, generally speaking, in the order of interest in the moveable estate of the deceased. In Scots law, persons entitled to the estate by a general settlement have a right to be appointed before others; failing them, the next of kin are preferred; failing them, the widow; failing her, creditors,—and failing them, legatees. In English law, the widow or the next of kin or both of them may be appointed; failing them, creditors; and failing them, the Ordinary may appoint whomsoever he may think proper. In practice, however, it is usual when the executor refuses to act, to grant administration to the residuary legatee, that is, the person entitled by will to the remainder of the personal property after payment of the debts and legacies. An executor may refuse to act, but having once acted he cannot divest himself of the office or its responsibilities. He has to prove the will before the proper court, and to exhibit on oath an inventory of the whole moveable estate of the deceased on a stamp corresponding to the value of the estate; on which he obtains a title to act, called in England a *probate*, in Scotland a *confirmation*. Before obtaining this title he may take possession of the moveables, pay and receive debts, and do other acts in execution of the will, but cannot become a party in any suit either as pursuer or defen-

der The other duties of an executor are the burial of the deceased in a suitable manner, the collecting of his goods and chattels, and the recovery of such as are withheld, the payment of his just and lawful debts, deathbed and funeral expenses, and expenses of administration, and the disposal of the residue as by will or by law directed.

The office of executor is one of great trust and responsibility. As representative of the deceased, he has the same property in his goods as the principal had when living, and the same remedies to recover them. He is at the same time a trustee for behoof of the creditors, legatees, and next of kin of the deceased; and accordingly acts inferring fraud or negligence are treated with great severity. Executors-dative and administrators are required to find security for the faithful execution of their trust to an amount not exceeding the amount of the inventory. An executor is liable for the debts of the deceased only to the amount of the inventory, but if he intromit with the funds or moveables so as to lead to a suspicion of fraud, or so as to leave no means of ascertaining its extent, he is liable for all the debts of the deceased; and strangers intromitting in the same manner, incur the like liability. If he pay sums not due by the deceased, he will be personally liable for the amount to the persons interested, unless such are paid upon decrees. He is also held liable for any loss occasioned to the estate through negligence. The duties of an executor are of so varied and complicated a nature that any general directions must necessarily be imperfect and might tend to mislead; and therefore the only safe course in all cases of doubt, is to consult a legal adviser.

EXECUTRY, in *Scots Law*, the moveable estate falling to the executor. Under executry or moveables is comprehended everything that can be moved.

EXEDRA, or EXHEDRA (ἐξ and ἕδρα, *a seat*), in ancient architecture, a chamber furnished with seats, and opening into a portico, where the philosophers and rhetoricians lectured and held their disputations; or a vestibule in a private house, where people met to enjoy conversation. At Rome this term was applied to any hall or saloon for conversing or disputing in; especially the hall in Pompey's theatre, where the senate met.

In medieval architecture it is sometimes applied to the porch of a church, especially to the Galilee or western porch; and sometimes the apsis was similarly designated.

EXEGESIS, a Greek word signifying *explanation*, and used principally in theology to denote a discourse by way of exposition or comment upon a scriptural passage. It is nearly synonymous with *hermeneutics*. In theology, under the term *exegetics* are comprehended apologetic divinity, or the defence of revealed religion and of the Scriptures, the history of the sacred canon, interpretation, and sacred philology.

EXEGETES (from ἐξηγέομαι, *I explain*), a Greek word signifying an interpreter or guide. At Athens, the Eumolpidæ were designated *exegetæ*, as the expounders of the sacred laws, rites, and customs. The term was afterwards applied also to those who acted as guides (*ciceroni*) to strangers visiting the most remarkable places in Greece.

EXEGETICA, in *Algebra*, the art of finding, either in numbers or lines, the roots of the equation of a problem, according as it is either numerical or geometrical.

EXEGETICS, in *Theology*. See EXEGESIS.

EXERGUE (Fr. from ἐξ and ἔργον *work*), in *Numismatics*, the lower part of the face of a coin or medal, when separated from the principal subject by a horizontal line which serves as a base to the subject. It usually contains some cipher, device, date, &c., to which also the same term is applied.

EXETER, the capital of Devonshire, a city and county in itself, and a municipal and parliamentary borough on the Ex, 10 miles N.W. of its mouth in the English Channel, and 160 miles from London. It stands on the acclivity and summit of an eminence rising from the E. bank of the river, and is intersected by four principal streets, which meet in the centre. These are crossed in various directions by numerous smaller ones, which are generally narrow. The city, however, on the whole, is clean and well built. The best parts are beyond the line of the ancient walls, and the suburbs contain elegant streets and terraces and numerous detached villas. The surrounding country is very fertile, affording good corn, pasture, dairy, and fattening land, and abounding in fruit, especially apples, which yield plentifully the best cider. The beauty of the immediate neighbourhood, the contiguity of several favourite watering-places, and the cheapness of provisions, induce many families of easy but moderate circumstances to reside here. Exeter is supposed to have been a settlement of the Britons before the Roman conquest. By the Romans it was called *Isca Damnoniorum;* and many coins, small bronze statues, tesselated pavements, and other relics of that people, have been discovered. During the Saxon period it was for some time the capital of Wessex, and was noted for the number of its religious establishments. It has undergone several sieges. Exeter was formerly the emporium of the thinner kind of woollen goods, such as serges, druggets, and long ells, which were spun and woven in the neighbouring towns, and dyed and finished in the city. Hence they were shipped to Holland, Italy, and especially to Spain, and many were supplied to the East India Company; but the introduction of machinery, and the lower price of fuel in the north of England have now nearly destroyed those branches of trade, with the exception of that for the supply of India, which is still considerable. As Exeter is a kind of metropolis for Devon and Cornwall, it has a considerable internal trade, and is the channel by which these counties are supplied with many foreign commodities. By means of a ship canal vessels of 300 tons burden can come up to the town; those of greater burden remain at Topsham, three miles lower down; and those of the largest size lie at Exmouth, at the mouth of the river. On 31st December 1853 the vessels registered at the port were:—vessels under 50 tons 41, tonnage 1197; above 50 tons 146, tonnage 19,533. During 1853 the coasting vessels inwards were 598, tonnage 57,785; outwards 216, tonnage 9961: vessels in the colonial trade, inwards 98, tonnage 4392; outwards 25, tonnage 1415: in the foreign trade, inwards 128, tonnage 9645; outwards 40, tonnage 4372. Exeter contains two excellent market-houses. The market-days are Wednesday and Friday. There are few manufactures carried on in the city, the inhabitants being chiefly employed in the retail trade and in handicrafts. The city is governed by a mayor, 12 aldermen, and 36 councillors, and returns two members to parliament. Population (1851) of municipal borough 32,818; of parliamentary borough 40,688; registered electors 2501. The cathedral is a magnificent pile of building, and part of it of great antiquity, having probably been commenced soon after the see of Devon was transferred from Crediton to Exeter in 1049. It has, however, undergone numerous alterations and additions at different times. The W. front has a façade adorned with numerous statues in niches and a profusion of tracery, over which is a magnificent painted window. The interior is very striking, from its exquisite proportions and simple grandeur. A richly ornamented screen separates the nave from the choir, and is surmounted by a very large organ, the large pipes being nearly 23 feet in height and 4 feet in circumference. St Mary's chapel, the chapter-house, the bishop's throne of richly-carved black oak, and some of the ancient ornaments, deserve especial notice. The cathedral is surmounted by two massive Norman towers—the northern containing a clock curiously ornamented, and an immense bell weighing 12,500 lbs. (both gifts of Bishop Courtenay); and the southern having a

peal of eleven bells. The see includes nearly the whole of Devonshire and Cornwall. Exeter contains a great number of parish churches, besides several chapels of ease and Dissenting places of worship. Near the cathedral, on the south-east, is the bishop's palace, a venerable building. On an eminence N.E. of the city are the ruins of the Rougemont castle, formerly the residence of the West Saxon kings. The guild-hall in High Street contains several valuable portraits. Among the other public buildings may be mentioned the custom-house on the quay, theatre, cavalry and artillery barracks, bridewell, county jail, and city prison. A handsome stone bridge has been thrown over the river at an expense of L.20,000. Exeter contains also a subscription ball-room, a subscription library, a literary and scientific institution, with a valuable museum and library, a free grammar-school, with 18 exhibitions to either of the great universities, several national and charity schools, the Devon and Exeter hospital, deaf-mute institution, lunatic asylum, blind asylum, dispensary, eye infirmary, mechanics' institution, savings-bank, and several almshouses. It is connected with Bristol by railway.

EXFOLIATION, in *Surgery*, the separation of a piece of dead bone from the living part.

EXHALATION. See EVAPORATION.

EXHAUSTIONS, in *Mathematics*. The method of exhaustions is a way of comparing or estimating fixed magnitudes by means of variable magnitudes, which may be brought to approach or *exhaust* them more nearly than any assigned interval or remainder.

Thus, a regular polygon may be inscribed in a circle, and by repeatedly doubling the multitude of sides, or increasing it by other given laws, this variable figure may be made so to *exhaust* the circle as to leave a remainder less than any given area. And because similar polygons inscribed in different circles have always the duplicate ratio of the diameters, it has been perceived that the circles themselves must be as these exhaurient polygons, which Euclid proves strictly by the method of exhaustions.

A rectilineal figure may be inscribed in a segment of a parabola, so as to leave less of the parabola than any area assigned, and also to be nearer four-thirds of the greatest inscribed triangle than any given difference. Hence Archimedes proves, by the method of exhaustions, that the segment of the parabola exceeds the triangle by one-third of the same triangle.

The first lemma of Newton's *Principia* brings the method of exhaustions to general application. It is in these words:—

"Quantitates, ut et quantitatum rationes, quæ ad æqualitatem tempore quovis finito constanter tendunt, et ante finem temporis illius propius ad invicem accedunt quam pro data quavis differentia, fiunt ultimo æquales.

"Si negas; fiant ultimo inæquales, et sit earum ultima differentia D. Ergo nequeunt propius ad æqualitatem accedere quam pro data differentia D: contra hypothesin."

Many authors have not rightly understood this lemma: as Horsley in his note upon it; Hutton on Prime and Ultimate Ratios, in his *Dictionary;* and Woodhouse, *Principles of Analytical Calculation*, paragraph 105, where it is said to be "merely a definition," and, again, that "it gave a new signification to the term equality."

If our opinion be just, it gives no signification to the term equality which was not given by Euclid and Archimedes. The novelty is in giving to the word *ultimate*, or the adverb *ultimately*, an extension beyond what it ordinarily includes; as, in the technical language of the *Principia*, things are often said to be *ultimately* what, by their definition, they are incapable of becoming.

In this language, as explained by its author, an ultimate quantity, or that which a quantity ultimately becomes (*fit ultimo*), is what is otherwise called the *limit* of the quantity; that to which, repeating the words of this lemma, *tempore quovis finito constanter tendit, et ante finem temporis illius propius accedit quam pro data quavis differentia.* Thus, in the *scholium* after the eleventh lemma, our author says, *ad ultimas quantitatum evanescentium summas, id est, ad limites summarum.*

Few as are the words of the demonstration of this celebrated lemma, it must be concluded from them that it only concerns quantities of which it could be questioned whether they have a *fixed* difference. Applied to variables, it can therefore only compare them in some simultaneous magnitudes. Among simultaneous magnitudes, Newton, for the sake of brevity, includes limits; and, in fact, only these limits are here compared. Perhaps a slight change in the language may show more clearly the intention.

"Quantities, as also the ratios of quantities, which in any finite time soever constantly tend to equality, and before the end of that time approach nearer than any difference, have equal limits."

"If not, let their limits be unequal, and differ by D. Then the variables, in their approach, cannot come nearer than D, *contra hypothesin.*"

This may be too concise, but is fully made out in the following manner:—

Let X and Y be two quantities, continually approaching, and capable of being brought nearer than any difference within a finite time. Let A be the limit of X, and B the limit of Y; that is, let A and B be fixed quantities, to which X and Y, during their approach, may be brought nearer than any difference assignable. Then shall A and B be equal.

For, if not, let $A = B + D$. And at any time during the approach of X and Y, let m be the difference of X from its limit, and n the contemporary difference of Y from its limit. And,

I. Suppose the variables to approach by the decrease of the greater and the increase of the less towards their respective limits (like a circumscribed and inscribed polygon); or $X = A + m$, $Y = B - n$. Then $X - Y = A - B + m + n = D + m + n$, so that X and Y necessarily differ by more than D, *contra hypothesin.*

II. Suppose both variables to decrease towards their limits; or $X = A + m$ and $Y = B + n$. Then $X - Y = A - B + m - n = D + m - n$.

Now if n were greater than m, we might decrease Y by a part of n, which we will call y, greater than m itself, and still greater than its part (x), the contemporary decrement of X; and putting X′ and Y′ for the variables thus decreased, we should have $X' = X - x$, $Y = Y - y$, and thence $X - Y' = X - Y + (y - x)$; so that the difference of the variables would be augmented by bringing them nearer to their limits. Therefore n cannot be greater than m; consequently $D + m - n$ cannot be less than D, or the difference of X and Y cannot become less than D, *contra hypothesin.*

III. It only remains to examine the case where both increase towards their limits, or $X = A - m$, $Y = B - n$, and $X - Y = A - B + n - m = D + n - m$.

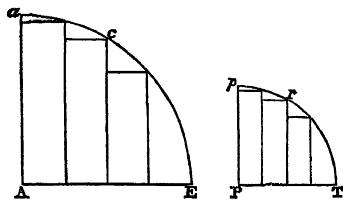
Here if m exceeded n, we might increase X by a quantity x greater than n, and still more exceeding y, the contemporary increment of Y, and putting X′ and Y′ to signify the variables thus increased, $X' - Y' = X + x = (Y + y)$, or $X' - Y' = X - Y + (x - y)$, so that the variables would again diverge. Therefore again $D + n - m$ cannot be less than D, or X and Y cannot differ by less than D, *contra hypothesin.*

If X, Y, A, B, D, m, n, x, y, represent *measures of ratios*, the proof includes the *quantitatum rationes.*

There results no absurdity from supposing the limits of two quantities which continually approach to have a difference D; but then the approaching quantities must always differ still more, contrary to one of the conditions.

Exhibition. By making n nothing in Case II. we make Y constant, and coincident in magnitude with B. The proposition obtained by the reasoning is, for this case, that whatever quantity A (suppose it a parabolic segment) may be an acknowledged limit of a variable X, if X can at the same time be proved to approach indefinitely to Y or B (suppose it a triangle equal to four-thirds of the greatest triangle in the parabolic segment), A is equal to B. This is to prove that limits of the same variable are equal, which is neither giving a new signification to equality, nor concluding an identical proposition, nor indeed one which an ancient geometer would have admitted without formal proof. We come to a similar conclusion by making m nothing in Case III.

It is true that, in the *Principia*, when a fixed quantity is proved to be a limit to a variable, and the variable then pronounced ultimately equal to the fixed quantity, the author or editors refer to the first lemma, when reference might as well be made to the definition of ultimate quantities there implied; only (what is the main thing) the demonstration of the lemma teaches how, by admitting the limit as a particular value of the variable, we cannot produce an error measured by any fixed quantity, while if an error were admitted at all it *must* be of fixed amount. Thus in Lemma IV. where the same multitude of rectangles is supposed to be inscribed in the two figures AacE, PprT, and when this multitude is indefinitely increased and consequently the breadth of the rectangles and the remainder of the areas indefinitely diminished, each rectangle in the one figure has, by hypothesis, the same ratio to a corresponding rectangle in the other; it is concluded that this is also the ratio of the whole figures. For the ratio of the area AacE to PprT may be viewed as compounded of AacE to the rectangles within itself, of these to the contemporary rectangles within PprT, and of these latter rectangles to PprT. But the first and last of the component ratios being *ultimately* of equality, the compound ratio is the constant ratio of the contemporary rectangles. For let L be the measure of the ratio of the inscribed rectangles, and let it be asserted that the compound ratio differs from L by a ratio whose measure is D. The first and last of the component ratios being ultimately of equality, their contemporary values may be made such that the measures (m and n) of the ratios by which the former exceeds equality and the latter falls below it, may be each less than D, and, *a fortiori*, their difference less than D. But L + $m - n$ is the true measure of the compound ratio; therefore L does not differ from the true measure by D.



Thus, by admitting ultimate values, no error is admitted. The method of exhaustions, which Newton's first lemma reduces to an enunciable proposition, only requires it to be allowed that fixed quantities either have a fixed difference or are equal. What is often called the principle of limits is to comprehend limits at once in the conclusion of a demonstration which does not apply to them. Newton's lemma serves to admit them through the method of exhaustions. According to the foregoing exposition, it is neither an identical proposition nor an arbitrary extension of the meaning of a term, though these inconsistent charges have both been brought against it. A and B are proved to be equal in the old signification of equality; and whilst it is said that X and Y are *ultimately* equal, X and Y are also ultimately A and B. (G. B. W.)

EXHIBITION (*exhibere* to exhibit, furnish, maintain, &c.), a showing or presenting to view; a display. In law, delivery of writings in proof of facts; a bill of discovery. In our old writers it is also used for an allowance of meat and drink, a pension or salary; and it is now applied to a benefaction settled for the maintenance of scholars in English universities, not depending on the foundation. In this sense the term is analogous to the Scottish *bursary*. Among physicians, exhibition is a standard and convenient term to express the administering of a medicine.

EXHIBITIONS *of Works of Fine Art.*—A collection of works of fine art arranged in some suitable place for public inspection is styled an exhibition. It is organized on a different principle from that of a national gallery or museum, for the works are not permanently conserved, but contributed for a limited period annually, new examples being provided for every successive exhibition.

Exhibitions are comparatively of modern institution. In former times artists were chiefly patronized by the church or the government, and the edifices in which their productions were placed were patent to the public; but now artists rely mainly on private patronage, and generally obtain the sanction of those for whom they execute works to exhibit them publicly for a limited period as specimens of their skill, or if executed for sale these exhibitions afford an opportunity of disposing of their works, while they themselves are improved in their art by the opportunity of comparing their own efforts with those of other artists.

The members of the Academy of the Fine Arts, founded at Rome in 1593, probably on particular occasions exhibited their works collectively to the public; but it was in France in 1737 that the members of the Royal Academy of Painting and Sculpture (founded 1648) first regularly instituted annual exhibitions. These were made biennial in 1745, and were from their commencement confined to works executed by members of the academy; but during the Revolution (by a decree in 1791) all artists, French or foreign, were allowed to participate in the exhibition, which in 1796 was again made annual.

The earliest attempt at an exhibition in England was in 1760; and the efforts of the artists were at length united in the Royal Academy's exhibitions, the first of which was opened in 1769. Since then they have been continued with increasing energy. In 1760 the number of works exhibited was 130, contributed by 69 artists; in 1855 there were 1558 works, contributed by 918 exhibitors. The annual revenue of the academy arises from a fee of one shilling from each visitor, and now exceeds L.8000.

The Royal Scottish Academy's exhibition is the second in importance in the United Kingdom. Though according to its present constitution it only dates from 1826, those who instituted it had previously organized exhibitions in Edinburgh, which had been annually continued, with some few interruptions, since 1808. At the first exhibition, 178 works were sent in by 27 contributors; at the exhibition in 1855 789 works were contributed by 287 exhibitors. The annual revenue exceeds L.2000. Exhibitions are annually opened in Dublin by the Royal Hibernian Academy. These are the only fine-art corporations in this country aided by government, the two first-mentioned being accommodated in public galleries, and the last receiving an annual money grant. Besides the above mentioned the following societies in London have also exhibitions, namely, the British Institution, founded in 1806; the Society of British Artists, in 1824; the National Institution, in 1850; the Society of Painters in Water Colours, in 1805; and the New Society of Painters in Water Colours, in 1835. There are also annual exhibitions in Manchester, Liverpool, Glasgow, Birmingham, Cork, Newcastle, &c. But with the exception of those in London and the Royal Scottish and Hibernian Academies, they are mainly composed of works collected all over the kingdom, but principally in London.

EXHIBITION OF 1851.—The Great Exhibition of Works of Industry of all Nations, held in the British metropolis,

was publicly announced in October 1849. Prince Albert, as president of the Society of Arts, offered himself to the public as their leader in the undertaking; and her Majesty's proclamation appointing a commission to promote the project was issued January 3, 1850. The amount of public subscriptions to the Crystal Palace was L.67,399, 3s. 10d. After much discussion relative to the site proposed, a vast structure was erected on the south side of Hyde Park, from a design of Mr (afterwards Sir Joseph) Paxton. This building (usually called the Crystal Palace from the material of which it was chiefly composed) resembled, upon a great scale, the Victoria Regia plant-house erected at Chatsworth, after Mr Paxton's own design. The contract with Messrs Fox and Henderson was for L.79,800—a sum afterwards somewhat increased by additions to the plan; or for L.150,000 if the building were permanently retained. The exhibition was opened by her Majesty in state, May 1, 1851; and it remained open to the public till 11th October—shortly after which time the Crystal Palace was taken down.

This gigantic structure occupied an area of 21 acres, and was composed entirely of large sheets of glass set in a framework of iron, except near the ground, where it was boarded. Its length was 1851 feet (a number corresponding to the year of the exhibition); and its width in the broadest part 456 feet: the transept, intersecting the building at right angles in the middle, was 408 feet long, 108 high, and 72 wide. The entire structure consisted of three tiers of elevation, the central portion being 64 feet high, the adjacent side portions 44 feet, and the outer sides 24 feet high. The materials employed were as follows:—896,000 superficial feet of glass weighing 400 tons; wrought-iron 550 tons; cast-iron 3500 tons; wood, including flooring, 600,000 cubic feet; nearly 2300 cast-iron girders, and 358 wrought-iron trusses for supporting the roof and the galleries (which extended nearly a mile in length); 30 miles of gutters; 202 miles of sash-bars, and 3330 cast-iron columns. The number of exhibitors was about 17,000; of prize-medals awarded, 2918; of council medals, 170. The greatest number of visitors in one week was in that ending 11th October, when the number of persons paying at the doors was 478,773. The total amount of entrance fees during the season was L.424,418, 15s.

The Great Exhibition of 1851 was altogether novel in principle, and unparalleled in magnitude and magnificence; comprehending under one roof, in almost endless variety, specimens of the industrial productions, not only of Great Britain, but of the European states generally, together with those of nearly every part of the habitable globe. An account of these, as well as of the peculiar mode of construction of the Crystal Palace, may be found in the official descriptive and illustrated catalogues and reports of the juries.

Our limits preclude our entering into the history of national industrial exhibitions, or to make more than a passing reference to the various local exhibitions of works of industry which have taken place from time to time in the United Kingdom, such as those at Cork, Sheffield, Plymouth, and Salisbury in 1852, Dublin in 1853, and in Birmingham in 1849. Similar exhibitions were organized in Belgium in 1830, in the United States in 1853, at Munich in 1854, and especially in France in 1798, 1801, 1802, 1806, 1819, 1844, and on a large scale in 1855. This last is constituted on an entirely different basis from the English Exhibition of 1851; being set on foot by the capital of a commercial company formed for the purpose, and on the prospect of remunerative profits; but the state also takes a distinct and positive share in the risks of the enterprise, as it does with railways and other works of public utility. A certain percentage to the holders of stock is guaranteed by the government; and in right thereof an imperial commission is appointed which exercises supreme control. By this arrangement the proprietors are to receive whatever surplus may remain after all expenses are paid; whereas the L.170,000 derived from the prices of admission to the London Exhibition stands over as a public trust fund, under royal charter, to be applied to objects in harmony with those for which the exhibition was held.

The French Exhibition is not contained under one roof, nor of the several buildings are all intended to be of a temporary character. The buildings, in the aggregate, will probably include greater area than the Crystal Palace in Hyde Park. The main building is the Palais de l'Industrie, a permanent edifice of rectangular form and with considerable pretensions to architectural effect. In this will be exhibited all the higher productions of manufacturing industry. There is also the "Annexe," a shed 4000 feet long, parallel to the Seine, for the exhibition of machinery and raw produce. According to the plan, these two structures are connected by a gallery running across the Champs Elysées, and having in its centre a fine circular space, which is appropriated to the productions of Sèvres and the other national establishments; and in addition there is an extra shed for the exhibition of carriages and other articles of great bulk.

For an account of the Crystal Palace at Sydenham, see SYDENHAM. Other exhibitions of works of art generally will be found under the heads of the places where they are held; as London, Edinburgh, Paris, &c.

EXIGENT, or EXIGI FACIAS, in law, a writ that issues where the defendant in an action is not to be found, or after a return of *non est inventus* on former writs. It requires the sheriff to cause the defendant to be called or *exacted* in five successive county courts to render himself; and if he does not appear, a judgment of outlawry is pronounced against him.

EXILE, in *Roman Antiquity*, a form of punishment, of which there were various degrees. Offences which came under the category of "capitalia" were punished either with death or with banishment; and this banishment consisted in the *aquæ et ignis interdictio*, which involved the loss of citizenship to the criminal. Other kinds of banishment were properly called *relegatio*, which word could not be used as a term of personal reproach in the same manner with exsul. Thus Ovid declares himself to have been merely a relegatus, alleging that Augustus

Nil nisi me patriis jussit abire focis.

This distinction between relegatio and exsilium subsisted also in the times of the republic. During that era no Roman citizen could be deprived of his citizenship by a special statute unless he were previously condemned in a judicium. Even such as were convicted of capital offences did not lose their citizenship at Rome until they were admitted citizens of some other state; and this was effected not by the ademptio civitatis, but by the interdictio aquæ et ignis. Any citizen, however, who voluntarily exchanged his Roman citizenship for that of some other state, ceased by that very act to be a Roman citizen, as it was one of the fundamental principles of the Roman law that a man could not simultaneously be a citizen of two states. (See CITIZEN; OSTRACISM, &c.)

EXMOUTH, a market-town and watering place of England, county of Devon, at the mouth of the Ex, ten miles S.S.E. of Exeter. Pop. (1851) 5123. Exmouth was early a place of importance, and in 1347 contributed ten vessels to the fleet sent to attack Calais. It was the first watering-place on the coast of Devon, and is frequented not only for bathing, but also as a winter residence by those suffering under pulmonary diseases, as it is celebrated for the mildness of its climate, and is well sheltered from the N.E. and S.E. winds by some high hills which rise almost close behind it. The rides and walks in the neighbourhood are remarkably beautiful, and the Beacon hill commands one of the finest views in the south of England. It possesses assembly rooms, baths, libraries, and other essentials of a fashion able watering-place.

EXODIUM, in the ancient Greek drama, the conclusion of a tragedy; or, more strictly, that portion of the play in which the catastrophe is indicated and the plot begins to be unravelled.

Among the Romans the name of *exodia* was given to pieces of a burlesque or comic description acted after other plays, or as interludes; or perhaps the *exodia* were sometimes travesties on the subject of the play itself. These pieces were in verse, and were inserted in other plays, but chiefly in the *Atellanæ*. Their real character has not been very precisely ascertained; but it would appear that although distinct from the *Atellanæ* they were for the most part intimately connected with them. Under the emperors, *exodia*, or ludicrous pieces interlarded with much ribaldry and buffoonery, were performed by young and well-born Romans, who came forward at the conclusion of the tragedy or other play, after the professional actors and musicians had left the stage.

EXODUS (ἐξ and ὁδός a path or way), departure from a place. The second book in the Old Testament is thus designated, as containing a narrative of the departure of the Israelites out of Egypt under the conduct of Moses. See PENTATEUCH.

EXOGENOUS, a term applied in botany to plants in which growth takes place by increase from without; as distinguished from *endogenous* plants, or those of which the wood is formed by successive augmentations from the inside. See BOTANY.

EXORCISM, the act of expelling evil spirits from persons or places by means of certain adjurations and ceremonies. The belief in demoniacal possessions, which may be traced in almost every nation, has always been attended by the professed ability, on the part of some individuals, to release the unhappy victims from their calamity. In Greece, men of no less distinction than Epicurus and Æschines were sons of women who lived by this art; and both were bitterly reproached, the one by the Stoics, and the other by Demosthenes (*De Cor.*), for having assisted their parents in these practices. This power was in some instances considered as a divine gift; in others it was thought to be acquired by investigations into the nature of demons and the qualities of natural productions, as herbs, stones, &c., and by the use of certain forms of adjurations and ceremonies. Indeed the various forms of exorcism, alluded to in authors of all nations, are innumerable. The power of expelling demons Josephus places among the endowments of Solomon, and relates that he *left behind him* the manner of using exorcisms by which they drive away demons. (For the pretended fragments of these books see Fabric. *Cod. Pseud. Vet. Test.*, p. 1054.) He relates that he had seen a man named Eleazar releasing people that were demoniacal, in the presence of Vespasian, his sons, captains, and soldiers, by means of a certain root set in a ring; on the application of which to the nose of the patient, the devil was expelled through his nostrils. (See *Antiq.* viii. 2, § 5; and *De Bell. Jud.* vii. 6, § 3.) The profession of exorcist was not uncommon among the Jews; and the epithet applied to such persons (περιερχομένων, Vulg. *de circumeuntibus Judæis*) would indicate that they were travelling mountebanks, who, having perhaps some knowledge of medicine, pretended also to magical skill. The subject of demoniacal possession is treated at length under the head DÆMONIAC.

The practice of exorcism still makes a part of the superstitions of some churches. In the religious system of the Church of Rome, (the rituals of which forbid the exorcising of any person without the bishop's leave,) the ceremony is performed at the lower end of the church, towards the door. The exorcist first signs the possessed person with the figure of the cross, desires him to kneel, and sprinkles him with holy water; then follow the litanies, psalms, and prayer; after which the exorcist asks the devil his name, and abjures him by the holy mysteries of the Christian religion not to afflict the person possessed any more. Then, laying his right hand on the dæmoniac's head, he repeats the form of exorcism as follows: "I exorcise thee, unclean spirit, in the name of Jesus Christ; tremble, O Satan, thou enemy of the faith, thou foe of mankind, who hast brought death into the world, who hast deprived men of life, and hast rebelled against justice; thou seducer of mankind, thou root of evil, thou source of avarice, discord, and envy." Houses and other places supposed to be haunted by unclean spirits are likewise to be exorcised with ceremonies very similar.

EXORCISTS, in *Ecclesiastical History*, an order of men in the ancient church, whose employment it was to exorcise or cast out devils. They owed their origin to the doctrine of the neo-Platonists, adopted by the Christians, that vicious men are impelled to sin less by their natural depravity than by the suggestions of some evil spirit lodged within them.

EXORDIUM, in *Rhetoric*, the preamble or introduction to a discourse, which serves to prepare the audience for the main subject. It is either formal and deliberate, or vehement and abrupt, according to the nature of the subject.

EXOSMOSE, and ENDOSMOSE, are relative terms derived from the Greek ὠσμός signifying *impulsion*, and applied to the attraction of one gas, vapour, or liquid for another of less density, operating through a vegetable or animal membrane, or other porous medium. When two fluids of different densities are separated from each other by such medium, the denser will attract the lighter fluid. When the transmission thus effected is from within outwards, it is termed *exosmose;* and when the action is in the contrary direction, it is termed *endosmose.* This subject is treated in more detail under BOTANY, vol. v., p. 68.

EXOTERIC, and ESOTERIC, are terms denoting *external* and *internal*, and applied to the double doctrine of the ancient philosophers, particularly those of the Peripatetic school. The one was public or *exoteric;* the other secret or *esoteric.* The first was that which they openly professed and taught to the world; the latter was confined to a small number of chosen disciples. This method was derived originally from the Egyptians, who, according to the united testimony of Herodotus, Diodorus Siculus, Strabo, Plutarch, and others, had a twofold philosophy; the one secret and sacred, the other public and common. The same practice also obtained amongst the Persian Magi, the Druids of the Gauls, and the Brahmins of India. The Egyptian priests, with whom it originated, sustained the character of judges and magistrates, and probably introduced this distinction with a view to the public welfare, and to serve the purposes of legislation and government. As Clemens Alexandrinus informs us, they communicated their mysteries principally to those who were concerned in the administration of the state; and Plutarch confirms this declaration. Others, however, have supposed that they invented the fables of their gods and heroes, and the external ceremonies of their religion, to disguise and conceal natural and moral truths; but whatever may have been the motive of their practice, it was certainly applied to political purposes. See ESOTERIC.

EXOTIC (ἔξωθεν *from without* or *abroad*), foreign; pertaining to or produced in a foreign country; extraneous. The term is used chiefly of plants, particularly those brought from tropical countries. It is also applied to words of foreign origin.

EXPANSION, in *Physics*, denotes the enlargement or increase of bulk in bodies, chiefly by means of heat. This is one of the most general effects of that subtile principle, and common to all bodies whatever, whether solid or fluid. In some few cases, indeed, bodies seem to expand as they grow cold, as water in the act of freezing; but this is found to be owing to a new arrangement of the particles, or to crystallization, and is not at all a regular and gradual ex-

pansion like that of metals or any other solid or fluid substance by means of heat. In certain metals also, an expansion takes place when they pass from a fluid to a solid state; but this too is not to be accounted any proper effect of cold, but of the arrangement of the parts of the metal in a peculiar manner; and it is therefore to be ascribed to a kind of crystallization.

EXPECTATION, in the doctrine of chances, is applied to any contingent event, and is capable of being reduced to the rules of computation. Thus a sum of money in expectation when a particular event happens, has a determinate value before that event arrives; so that if a person is to receive any sum, say L.10, when an event takes place which has an equal probability of happening and failing, the value of the expectation is half that sum, or L.5; and in all cases the expectation of obtaining any sum is estimated by multiplying the value of the sum expected by the fraction which represents the probability of obtaining it. The expectation of a person who has three chances in five of obtaining L.100, is equal to $\frac{3}{5} \times 100$, or L.60, and the probability of obtaining L.100 in this case is equal to $\frac{60}{100} = \frac{3}{5}$. See PROBABILITIES.

EXPECTATION of Life signifies that share or number of the years of human life which a person of any given age may expect to enjoy upon an equality of chances. See ANNUITIES.

EXPERIMENTAL PHILOSOPHY. See PHILOSOPHY, PHYSICS, MECHANICS, &c.

EXPERIMENTUM CRUCIS, a *crucial* experiment, or one which is decisive, confirming or disproving at once the question at issue. An experiment is thus termed either because it resembles a cross or direction-post to point out the true course of discovery, or rather as being a kind of torture by means of which the nature of the thing experimented on is as it were extorted by force.

EXPIATION, FEAST OF (called by our translators the Day of Atonement), a Jewish festival held on the tenth day of Tishri, or the seventh month of the Jewish year; on which day the high priest entered into the holy place, and having confessed his sins, made an atonement for all the people.

EXPLOSION, a sudden and violent expansion of an aerial or other elastic fluid, by which it instantly throws off any obstacle that happens to be in the way, sometimes with great force, and in such a manner as to produce destructive effects upon adjacent objects.

With regard to solids, explosion differs from expansion, which is a continuous power, acting uniformly for some time; whereas the former is sudden, and only of momentary duration. The expansions of solid substances do not terminate in violent explosions, on account of their slowness, and the small space through which the metal, or other expanding substance, moves; though their strength may be equally great with that of the most active aerial fluids. Thus we find that though wedges of wood when moistened will cleave solid blocks of stone, they never throw them to any distance, as is the case with gunpowder. On the other hand, it is seldom that the expansion of any elastic fluid bursts a solid substance without projecting the fragments of it to a considerable distance. The reasons of this are, first, the immense velocity with which the aerial fluids expand, when affected by a considerable degree of heat; and, secondly, their celerity in acquiring heat and being affected by it, which is much superior to that of solid substances. Thus air, heated as much as iron when brought to a white heat, is expanded to four times its bulk; but the metal itself will not be expanded the five-hundredth part of its bulk.

In the case of gunpowder, the velocity with which the flame moves is calculated by Robins (*Treatise upon Gunnery*) to be no less than 7000 feet in a second, or little less than 79 miles in a minute. Hence the impulse of the fluid is inconceivably great, and the obstacles on which it strikes are hurried off with vast velocity, though much less than that just mentioned; for a cannon ball, with the greatest charge of powder that can be conveniently given, does not move at a greater rate than 2400 feet in a second, or little more than 27 miles in a minute. The velocity of the ball, again, is promoted by the sudden propagation of the heat through the whole body of air, as soon as it is extricated from the materials of which the gunpowder is made; so that it is enabled to strike all at once, and thus greatly to augment the momentum of the ball. That this contributes much to the force of the explosion is evident from what happens when powder is wetted or mixed with any substance, which prevents its taking fire all at once. In this case the force of the explosion, even when the same quantity of powder is made use of, cannot be compared to that of dry powder.

Upon these principles we may conclude that the force of an explosion depends, first, on the quantity of elastic fluid to be expanded; secondly, on the velocity it acquires by a certain degree of heat; and, thirdly, on the celerity with which the degree of heat affects the whole of the expansive fluid. These three take place in the greatest perfection where the electric fluid is concerned, as in cases of lightning. In violent lightning, where the electric fluid collects itself into balls, the strength of the explosion is proportional to the quantity. The violent effects of lightning when it strikes buildings, trees, or even the most solid rocks, is well known; and in some cases, where the quantity of electricity is still greater than in any flash of lightning, still more tremendous consequences ensue. Dr Priestley gives an instance of a large fire-ball, or quantity of electric matter, rolling on the surface of the sea, which, after rising up to the topmast of a ship of war, burst with such violence, that the explosion resembled the discharge of hundreds of cannon fired at once. Great damage was done by it; but there is not the least doubt that most of its force was spent on the air, or carried down to the sea by the mast and iron-work of the ship. Considering, indeed, that in all cases a great part of the force of electrical explosions is dissipated in this manner, it is impossible to measure it by any method applicable to the mensuration of other forces.

Next in strength to the aerial vapours are those of aqueous and other liquids. The most remarkable effects of these are observed in steam-engines; but there is one particular case from which it has been inferred that aqueous steam is incomparably stronger than the flame of gunpowder. This is when water is thrown upon molten copper; for here the explosion is so strong as almost to exceed imagination; and terrible accidents have been known to happen from such a slight cause as one of the workmen spitting in the furnace where copper was being melted.

It may now be asked, why such explosions do not take place when water is thrown upon the surface of any other metal, for instance iron, when in a state of fusion? In answer to this it may be observed, that water is decomposed by being applied to red-hot iron in the form of steam, and one of its elements enters into combination with the iron. It may be observed, that in all cases where a very hot body is thrown upon a small quantity of water in the liquid state, an explosion will follow. Here the water is confined, and suddenly rarefied into steam, which cannot escape without throwing off the body which confines it. Examples of this kind frequently occur where masons or other mechanics are employed in fastening cramps of iron into stones; if there happen to be a little water in the hole into which the liquid lead is poured, the latter will fly out in such a manner as sometimes to occasion serious accidents. Occurrences of this kind have sometimes happened in founderies, when molten metal has been poured into wet moulds. In these cases, the sudden expansion of the aqueous steam throws

out the metal with great violence; and if any decomposition take place at the same time, so as to convert the aqueous into an aerial vapour, the explosion will be still greater.

A similar explosion takes place on pouring cold water into boiling or burning oil or tallow. The same effect follows whether we pour the oil on the water or the water on the oil. In the former case the water, which lies at the bottom, is rarefied into steam, and explodes; in the latter, it sinks down through the oil by its superior specific gravity, and explodes as it passes along. In either case, however, the quantity of aqueous fluid must be but small in proportion to that of the oil; a very great quantity would put out the flame, or destroy the heat, in whatever way it might be applied.

The effects of explosions, when violent, are felt at a considerable distance, by reason of the concussions they give to the atmosphere; for all of them act upon the atmospherical fluid with the same force which they exert upon terrestrial substances subjected to their action. Sir William Hamilton relates, that in consequence of the explosions of Vesuvius in 1767, the doors and windows of the houses at Naples flew open if unbolted, and one door was burst open though it had been locked. The same effect has been observed on the explosion of powder-magazines.

EXPONENT, or INDEX, in *Algebra*. See ALGEBRA, vol. ii., p. 491.

EXPONENT of the ratio, in arithmetic, is the quotient arising when the antecedent is divided by the consequent of the ratio. Thus 4 is the exponent of the ratio of 20 to 5; for $\frac{20}{5} = 4$.

EXPONENTIAL Calculus, the method of differencing, or finding the fluxions of exponential quantities, and of summing up those differences, or finding their fluents.

EXPONENTIAL Curve is that the nature of which is defined or expressed by an exponential equation; as the curve denoted by $a^x = y$, or by $x^x = y$.

EXPONENTIAL Equation is one in which is contained an exponential quantity; as the equation $a^x = b$, or $x^x = ab$, &c.

EXPONENTIAL Quantity is that the power of which is a variable quantity; as the expression a^x, or x^y. Exponential quantities are of several degrees and orders, according to the number of exponents or powers.

EXPOSING OF CHILDREN. This was a common practice among the Greeks, Romans, and other ancient nations. But from this charge must be excepted the Thebans, who had an express law by which it was made capital to expose children, and at the same time ordained that such as were not in a condition to educate their offspring should take them to the magistrates, that they might be brought up at the public expense. Among the other Greeks, when a child was born, it was laid on the ground; and if the father designed to educate it, he immediately took it up; but if he forbore to do so, the child was carried away and exposed. The Lacedæmonians indeed had a different custom: with them all new-born children were brought before certain persons, considered as among the wisest in their own tribes, by whom the infants were carefully examined; and if the latter were found strong and well formed, orders were given for their education, with a certain proportion of land for their maintenance; but if weakly or deformed, they were cast into a deep cavern in the earth, near Mount Taygetus, as it was thought neither for the good of the infants themselves nor for the public interest that defective children should be reared. Many children were exposed only because their parents were not in a condition to educate them; and it was the unhappy fate of daughters especially to be thus treated, as their education and settlement in life involved a greater expense than those of sons. The parents frequently tied jewels and rings to the children they exposed or any other thing by which they might afterwards discover them, if they should survive; or to encourage those that might find them to nourish and educate them; or, if found dead, to give them human burial. It was usual to expose children in such places as were most frequented, in order that they might be found and compassionated by persons who were in circumstances to defray the expense of their education. As foundlings became the property of those who brought them up, instances were not wanting of great cruelties exercised towards these unfortunate individuals; such as, for instance, mutilating their persons and exhibiting them in the streets, in order to derive an infamous livelihood from the alms bestowed on them by compassionate passengers. By a law passed at Rome A.D. 374, the exposure of children was made a punishable offence; but it was not till the year 530 that their slavery was abolished, when Justinian published an edict to that effect.

EX POST FACTO, a law phrase used to denote something made to apply to a thing already done. Thus, for example, a law is said to be made *ex post facto* when it renders an offence punishable in a manner in which it was not punishable at the time it was committed.

EXPRESSED OILS, are such as are obtained from bodies by pressure only. See OILS.

EXTENT, in *Law*, is used in a double sense, denoting either a writ of execution (called also an *extendi facias*) directed to the sheriff against the person, lands, and goods, or the lands only, of a debtor; or the act of the sheriff or officer upon this writ. These writs are of two kinds, to both of which the sovereign is by ancient prerogative entitled, for the purpose of obtaining satisfaction of debts due or assigned to the crown. The writ of *extent in chief* is a proceeding by the sovereign for the recovery of his own debt, and in which he is the real plaintiff. The writ of *extent in aid* is also sued out at the instance and for the benefit of the crown against the debtor of a crown debtor. In this last proceeding the sovereign is only the nominal plaintiff.

EXTRACT, in *Pharmacy*, a preparation of vegetable principles obtained by digesting vegetable substances in water or in alcohol, and evaporating them to a pasty or solid consistence; or by boiling down the expressed juices of fresh plants. According to the mode of preparation, they are termed either aqueous or spirituous extracts.

The name *extractive principle*, or *extractive*, is given by chemists to a peculiar principle which is supposed to form the basis of all vegetable extracts.

EXTRACT OF LEAD, the name given to the impure acetate of lead obtained by boiling litharge in vinegar. It is commonly known as *Goulard's extract*.

EXTRACTION OF ROOTS, in *Algebra* and *Arithmetic*, the method of finding the roots of given numbers or quantities. See ALGEBRA and ARITHMETIC.

EXTRAORDINARII, in the ancient Roman army, a select body of men consisting of the third part of the foreign cavalry and a fifth of the infantry. These were carefully separated from the other forces borrowed from the confederate states, in order to prevent any treacherous coalition between them. From among the *extraordinarii* a more choice body of men were drawn, under the name of *ablecti*.

EXTRAVAGANTES, a name given to certain decretal epistles, or constitutions of the popes, which were published from the Clementines, but were not at first digested or arranged with the other papal constitutions. Hence the name which they continued to retain, even after their insertion in the body of the canon law. See CANON LAW, vol. vi., p. 190.

EXTRAVASATION (*extra* beyond, and *vas* a vessel), in *Medicine*, the escape of blood, or other fluid, from its natural receptacle into a neighbouring part of the body. The fluid thus thrown out is said to be *extravasated*.

EXTREME, in *Logic*. The *extremes*, or extreme terms of a syllogism, are the predicate and subject. They are called *extremes* from their relation to another term, which is a medium or mean between them. Thus, in the syllogism, "Man is an animal; Peter is a man; therefore Peter is an animal; the word *animal* is the greater extreme, *Peter* the less extreme, and *man* the medium.

Extreme and mean proportion, in *Geometry*, is when a line is so divided, that the whole line is to the greater segment as that segment is to the other; or, as it is expressed by Euclid, when the line is so divided that the rectangle under the whole line and the lesser segment, is equal to the square of the greater segment.

EXTREME UNCTION has been since the twelfth century one of the seven sacraments of the Roman Catholic Church. The ceremony is performed as follows:—When a person is supposed to be at the point of death, his eyes, ears, nostrils, mouth, and hands are successively anointed with the sacred oil by the priest. At each anointing the priest says: "By this holy unction, and through His great mercy, Almighty God forgive thee whatever sins thou hast committed by 'sight,' 'smell,' 'hearing,' 'touch,'" &c. At the same time the priest has the power of absolving the dying person from all sins, even from those which in the seventh chapter of the decree on penance are reserved to the decision of the Supreme Pontiff. The oil used in extreme unction is supposed to represent the grace of God poured down into the soul, and the prayer offered up at the time of anointing to express the remission of sins thereby granted to the sick person. The Council of Trent has decreed extreme unction to be a sacrament, and declares that, "Whoever shall affirm that extreme unction is not truly and properly a sacrament, instituted by Christ our Lord, and published by the blessed apostle James, but only a ceremony received from the fathers, or a human invention, let him be accursed." And it denounces a similar anathema against all who "shall affirm that the sacred unction of the sick does not confer grace, nor forgive sin, nor relieve the sick, but that its power has ceased, as if the gift of healing existed only in past ages" (Sess. xiv. Can. I. *et seq.*) As this unction has, according to the tenets of the Romish Church, sacramental efficacy, purifying the dying person from his sins, and communicating to him divine forgiveness, it can only be administered by a bishop or priest, and is not to be given to infants or to excommunicated persons, or to those who die impenitent, or in the actual commission of mortal sin. Roman Catholics found their opinion of the efficacy of extreme unction on the custom of the apostles, who "anointed with oil many that were sick, and healed them," and on the exhortation of the apostle James (v. 14): "Is any sick among you? let him call for the elders of the church, and let them pray over him, anointing him with oil in the name of the Lord." On the other hand, Protestants deny the sacramental significance and efficacy of this ceremony, because nothing is known of a formal establishment of it by Christ himself. They allege that "extreme unction," from its very nature, is to be administered only in the immediate prospect of death, and when the patient is past all hope of recovery; whereas the anointing practised by the apostles and other early ministers of religion was with a view not to the death but the recovery of the sick person —not that he might be prepared to die, but that he might be restored to health: "and the prayer of faith shall save the sick, and the Lord shall raise him up" (Jas. v. 15). The Orientals are strongly persuaded of the sanative properties of oil; and it was under this impression that the Jews anointed the sick and applied oil to wounds (Isa. i. 6, Mark vi. 13; Luke x. 34). Anointing was therefore employed as a cure for various disorders, as well as for the purpose of promoting the general health of the body. This custom still prevails in the East. The Jews in Mocha assured Mr Forskal that the Mohammedans as well as the Jews in Sana, when they were sick, were accustomed to anoint the body with oil; and Niebuhr states that, "in Yemen the anointing of the body is believed to strengthen and protect it from the heat of the sun, by which the inhabitants of this province, as they wear but little clothing, are very liable to suffer. Oil, by closing up the pores of the skin, is supposed to prevent that too copious transpiration which enfeebles the frame; when therefore the intense heat comes on, the Arabs always anoint their bodies with oil." In the Greek Church unction is administered not only to dying persons, but generally in diseases of all kinds, as tending to promote the restoration of health, as well as the forgiveness of sins. (J. T—R.)

EXUVIÆ (Latin), a term applied in natural history to the cast skins, shells, or coverings of animals; as the skins of serpents and caterpillars, the shells of lobsters, &c. It is also applied to fossil spoils, or remains of animals.

EY, the pure Islandic or Scandinavian for *island;* from which comes *eyet*, or *eyght*, an *islet*.

EYE. See Anatomy, iii. 43; and Optics.

EYE, a municipal and parliamentary borough and market-town of England, county of Suffolk, 20 miles N. of Ipswich. It is governed by four aldermen and twelve councillors, and returns one member to parliament. Pop. (1851) of municipal borough, 2587; of parliamentary borough, 7531. Registered electors, 356. Eye is situated in a low fertile tract of country, and is nearly surrounded by a small stream, an affluent of the Waveney. The streets are narrow, irregular, and unpaved, while the white-washed houses and thatched roofs give Eye the appearance of a large agricultural village. The church is a spacious cruciform edifice, with a fine embattled tower. The free grammar-school has two exhibitions to Cambridge University. The guild-hall is a handsome modern building. There were formerly a castle and a small Benedictine priory at Eye;—the former has disappeared, but of the latter some ruins are still to be seen to the east of the town. Market-days, Tuesday and Saturday. Eye received its first charter from King John; and previous to the passing of the Reform Act returned two members to parliament. The inhabitants are chiefly employed in agriculture.

EYEMOUTH, a small seaport and market town of Scotland, county of Berwick, situated at the mouth of the Eye, 7 miles north of Berwick. It is a place of considerable antiquity, and had a fort of great strength, which, however, has been destroyed. Being the Scottish harbour nearest to England, it was a place of importance in the wars between the two countries. In later times it was for many years famous for smuggling, but that illicit traffic has been long suppressed. The harbour has been much improved by the erection of a breakwater, and vessels may now enter and depart at all times of the tide. Eyemouth has a weekly grain market, and extensive granaries have been erected near the pier. Pop. of parish (1851) 1488, many of whom are engaged in the fisheries.

EYRE (? *iter* a journey), in *Law*, signifies the court of justices itinerant. Hence the expression, justices in eyre.

EZEKIEL, *i.e.*, [*whom*] *God will strengthen*, or *God will prevail*, one of the greater prophets, whose writings, both in the Hebrew and Alexandrian canons, are placed next to those of Jeremiah. He was the son of Busi the priest, and, according to tradition, was a native of Sarera. Of his early history we have no authentic information. We first find him in the country of Mesopotamia, "by the river Chebar," now *Khabûr*, a stream of considerable length flowing into the Euphrates near Circesium, *Kirkesia*. On this river Nebuchadnezzar founded a Jewish colony from the captives whom he brought from Jerusalem when he besieged it in the eighth year of king Jehoiachim. This colony (or at least a part of it) was settled at a place called Tel-Abib;

Eziongeber || Ezra.

and it seems to have been here that the prophet fixed his residence. He received his commission as a prophet in the fifth year of his captivity (B.C. 594). Ezekiel is remarkably silent respecting his personal history; the only event which he records (and that merely in its connection with his prophetic office) is the death of his wife in the ninth year of the captivity. He continued to exercise the prophetic office during a period of at least twenty-two years, that is, to the 27th year of the captivity; and it appears probable that he remained with the captives by the river Chebar during the whole of his life. That he exercised a very commanding influence over the people is manifest from the numerous intimations we have of the elders coming to inquire of him what message God had sent through him (ch. viii. 1; xiv. 1; xx. 1; xxxiii. 31, 32, &c.) Carpzov (pp. 203–4) relates several traditions respecting his death and sepulchre, principally from the treatise *De Vitis Prophet.*, falsely attributed to Epiphanius. It is there said that he was killed at Babylon by the chief of the people, on account of his having reproved him for idolatry; that he was buried in the field of Maur in the tomb of Shem and Arphaxad, and that his sepulchre was still in existence. Such traditions are obviously of very little value.

Most critics have remarked the vigour and surpassing energy which are manifest in the character of Ezekiel. The whole of his writings show how admirably he was fitted, as well by natural disposition as by spiritual endowment, to oppose the "rebellious house," the "people of stubborn front and hard heart," to whom he was sent. The figurative representations which abound throughout his writings, whether drawn out into lengthened allegory, or expressing matters of fact by means of symbols, or clothing truths in the garb of enigma, all testify by their definiteness the vigour of his conceptions. Things seen in a vision are described with all the minuteness of detail and sharpness of outline which belong to real existences. But this characteristic is shown most remarkably in the entire subordination of his whole life to the great work to which he was called. We never meet with him as an ordinary man; he always acts and thinks and feels as a prophet.

The genuineness of the writings of Ezekiel has been the subject of very little dispute. According to Jewish tradition, doubts were entertained as to the canonicity of the book on the ground of its containing some apparent contradictions to the law, as well as because of the obscurity of many of its visions. These, however, were removed, it is said, by Rabbi Hananias, who wrote a commentary on the book, in which all these difficulties were satisfactorily solved.

EZIONGEBER. See AKABAH.

EZRA, the celebrated Jewish scribe and priest, who, about the year B.C. 458, led the second expedition of Jews back from the Babylonian exile into Palestine. This Ezra was a lineal descendant of Phinehas, the son of Aaron, and ought to be distinguished from the Ezra who went up as one of the chiefs of the priests and Levites under Zerubbabel (Neh. xii. 1–33). In addition to the information given in the books of Ezra and Nehemiah, that Ezra was a "scribe," a "ready scribe of the law of Moses," &c., we are told by Josephus that he was high priest of the Jews who were left in Babylon; that he was particularly conversant with the laws of Moses, and was held in universal esteem on account of his righteousness and virtue.

In the the year B.C. 457 Ezra was sent by "Artaxerxes Longimanus to inquire concerning Judah and Jerusalem; and to carry the silver and gold which the king and his counsellors freely offered unto the God of Israel," with the free-will offerings which the people and priests offered for the house of God at Jerusalem. At the same time Artaxerxes issued a decree to the keepers of the king's treasure beyond the river, to assist Ezra in everything in which he needed help, and to supply him liberally with money, corn, wine, oil, and salt.

Ezra assembled the Jews who accompanied him on the banks of the river Ahava, where they halted three days in tents. On the twelfth day from their first setting out Ezra and his companions left the river Ahava, and arrived safely at Jerusalem in the fifth month, where he shortly after had the painful duty of enforcing the law which forbade the Jews to intermarry with heathens, many of whom had formed such illegal connections in the land of their captivity, and which they were now called on to dissolve.

In Neh. viii. we read that, on the occasion of the celebration of the feast of the seventh month, subsequently to Nehemiah's numbering the people, Ezra was requested to bring the book of the law of Moses; and that he read therein standing upon a pulpit of wood, which raised him above all the people.

Josephus tells us that he died soon after this celebration of the feast of tabernacles, and was buried at Jerusalem with great magnificence. According to other traditions Ezra returned to Babylon, and died there at the age of 120 years. The Talmudic statement is that he died at Zamzumu, a town on the Tigris, while on his road from Jerusalem to Susa, whither he was going to converse with Artaxerxes about the affairs of the Jews. A tomb said to be his is shown on the Tigris, about 20 miles above its junction with the Euphrates.

Ezra is considered to be the author of the canon, and worthy to have been the lawgiver, if Moses had not preceded him.

The *canonical writings* of Ezra are, besides the book which bears his name, most likely the two books of the Chronicles. "Esram libros Paralipomenon lucubrasse Ebræorum omnium est fama consentiens" (Huetius, *Dem. Evang.*, iv. 14, p. 341). Some authors have ascribed the books of Nehemiah and Esther likewise to Ezra, although they differ in style.

F.

F, the fourth consonant and sixth letter of the English alphabet. The letter F is borrowed from the digamma or double gamma, Ϝ, of the Æolians, as is evident from the inscription on the pedestal of the Colossus at Delos; and though this letter is not found in the modern Greek alphabet, yet it was in the ancient one, whence the Latins received and transmitted it to us. It is formed by a forcible emission of the breath and placing at the same time the upper teeth on the under lip. It has but one sort of sound, which has a great affinity with *v* and *ph*, the latter being used by us for the letter φ in all words derived directly from the Greek. The Romans for some time used an inverted F, instead of V consonant, which had no peculiar figure in their alphabet. Thus, in inscriptions we meet with TERMINAꟻIT, DIꟻI, and so on. Lipsius and others say that it was the Emperor Claudius who introduced the use of the inverted digamma or Ⅎ; but it did not long subsist after his death; for Quintilian states that it was not used in his time. F or FA, in *Music*, is the fourth note in rising in this order of the gamut, *ut, re, mi, fa*. It likewise denotes one of the Greek keys in music, destined for the bass. F, in medical prescriptions, stands for *Fiat*, or Let it be done; thus, *f. s. a.* signifies *fiat secundum artem*. F was also a numeral letter signifying forty; according to the verse,

Sexta quaterdenos gerit quæ distat ab alpha.

And when a dash was added at top, thus, $\overline{\text{F}}$, it signified forty thousand. In the civil law, two of these letters together, *ff*, signify the Pandects. In English criminal law (by stat. 4th Henry VII., cap. 13), this letter was branded on felons, on their being admitted to benefit of clergy.

FABII, an illustrious family of ancient Rome, who from the time when they first began to make a figure in history, B.C. 486, till the reign of Tiberius, counted among their honours seven dictatorships, forty-eight consulships, eight censorships, and seven augurships, besides many inferior dignities. In the early times of the republic, it was an honourable distinction in the history of this family, that from 486 to 479 B.C. one of the two consuls was a member of the Fabian house. In that latter year the whole family to the number of 306 left the city, with the intention of taking the war with the Vejentes into their own hands, and settled with their households on the banks of the river Cremera, where they maintained themselves successfully against the enemy for two years. At the end of that period, however, they fell into an ambuscade and were cut off to a man. The only representative of the family at this time surviving was a youth, who, from his tender years, had been left at Rome. He became the ancestor of all the Fabii whose names are afterwards met with in Roman history, of whom the most distinguished were M. Fabius Ambustus, consul in the year of Rome 393, and afterwards re-elected for several successive years; his son Q. Fabius Maximus Rullianus, master of the horse under the Dictator Papirius, in whose absence, and contrary to whose orders, he fought a great battle with the Samnites whom he utterly defeated, but though victorious he made a very narrow escape with his life in consequence of having disobeyed the orders of the commander-in-chief, whom he had deprived of the opportunity of distinguishing himself. But the greatest of the Fabian family, and indeed one of the greatest of all the Romans of the Commonwealth, was Q. Fabius Maximus Verrucosus, the successful opponent of Hannibal in the second Punic war.

FABIUS PICTOR, the father of Roman history, was descended from M. Fabius Ambustus the consul. In the interval between the first and second Punic wars we find him taking an active part in the subjugation of the Gauls in the north of Italy (225 B.C.); and after the battle of Cannæ (216 B.C.), he was employed by the Romans to proceed to Delphi, in order to consult the oracle of Apollo. In his capacity of historian he is worthy of note as the first of the Roman annalists who set the example of writing the history of his country in prose. The rude muse of Nævius had already celebrated in verse the glory acquired by the Roman arms in the first Punic war, and Ennius had clothed the annals of his adopted country in the language of poetry. But till the time of Fabius Pictor, no one had appeared to chronicle in simple prose the *res gestæ* of Rome and the Romans. The sources from which he derived the materials for his history were the oral traditions current among the people, and the annals of the priests; and though his style seems to have partaken much of the dry and jejune character of these chronicles, it is highly praised by Livy (who borrowed very largely from Fabius), as well as by Cicero, Pliny, and many other writers. Polybius has expressed a doubt respecting their credibility, but apparently without sufficient reason. That he should have copied from a Greek writer, Diocles of Alexandria, as Dionysius hints, carries with it its own refutation; but it is a curious fact that he wrote his annals in the Greek as well as Latin language. To what period he brought down his history we are unable to determine. Livy speaks of his death 169 B.C. (Molleri *Diss. de Q. Fabio Pictore*, Altorf. 1689; Lachman, *De Fontib. Livii;* Fabric. *Bibl. Lat.*)

Q. FABIUS MAXIMUS *Verrucosus*. one of the most distinguished Romans of the republic. He first makes his appearance in history as the conqueror of the Ligurians, who had long braved the power of Rome; and though we have no account of his proceedings from this period down to the beginning of the second Punic war, he must have no doubt taken a prominent part in public affairs, as he was then appointed to head the embassy (219 B.C.) sent to Carthage to inquire whether that state approved of Hannibal's conduct in attacking Saguntum. The answer proved unsatisfactory; when Fabius, assuming the haughty dignity of a Roman senator, and folding up his cloak so as to form a cavity, thus addressed the nobles of Carthage: "Hic vobis bellum et pacem portamus; utrum placet sumite." Being answered that he might give which he pleased, he indignantly exclaimed, "Then I give you war;" and the deputies returned to Rome to state the result of their mission. The disastrous campaign on the Trebia, and the defeat on the banks of the Thrasymene Lake, warned the Romans that their successful resistance to Hannibal, and even their existence, depended on the wisdom of the general to whom they entrusted their troops. Everything pointed out Fabius as the person on whom the fate of Rome ought to be allowed to depend. The senate appointed him dictator; and the fearless character of Minucius probably induced Fabius to make him master of the horse, or second in command; and his conduct in that office did not eventually disappoint the expectations of his countrymen. The grand object of his policy was to weary out and exhaust the army of Hannibal, without the risk of a general engagement; and so closely did he adhere to the plan which he had laid down for himself, that he received from this circumstance the name of Cunctator. His slow and cautious policy by no means suited the ardent spirit of the Romans, and more particularly that of Minucius, his master of the horse, who began to ridicule the proceedings of Fabius, and, when he was absent at Rome, took the

opportunity of attacking the enemy, and came off victorious in a small skirmish. This tended only more strongly to confirm the opponents of Fabius in their opinion; and Varro was bold enough to propose that Minucius should be made equal in command with Fabius. The result was exactly such as might have been anticipated. Minucius engaged in battle with Hannibal, and his army was on the verge of ruin when the opportune arrival of Fabius changed the aspect of affairs. Minucius seems to have had the moral courage to confess his folly, and cheerfully to submit to the orders of Fabius. At the end of six months he resigned his dictatorship.

But it was not long before Rome was again obliged to have recourse to the experience of Fabius. After the defeat at Cannæ (216 B.C.), he was appointed, along with Marcellus, to the command of the armies; Fabius being called *the shield*, and Marcellus *the sword*, of the republic. He laid siege to the important city of Capua; and when Hannibal marched towards Rome, threatening the city itself, Fabius remained firmly at his post, trusting in the known bravery of his fellow-citizens. Again, in his fifth consulship, we find him taking the city of Tarentum; and when it was proposed, towards the conclusion of the war, that Scipio should pass into Africa, Fabius was decidedly opposed to the scheme. But he did not live to witness the final success of Scipio, having died at an advanced age, 203 B.C. For the details of his public life see art. ROMAN HISTORY.

FABLE is a word used in several senses, all arising out of that primitive meaning in which it denotes an invented or fictitious story. Its applications to literature are, especially in modern speech, much narrower than those of its root, the Latin Fabula; and the only one of these requiring notice is that in which it is the name of a particular kind of literary composition. A fable is a fictitious story, designed, characteristically and mainly, for illustrating a general or universal truth; and it may thus be said to be an allegory and something more, or an adaptation of the allegory to a special purpose. This description, however, would fairly include the Parable also, between which indeed, and the Fable or Apologue, the line of distinction is not very clear. It is, as commonly taken, no broader than this; that the invention of the latter is carried, while that of the former is not carried, beyond the bounds, not of the probable only, but even of the possible. Jotham's story to the men of Shechem is strictly an apologue, while Nathan's allegorical reproof to David is as strictly a parable; but many other tales would be referred to the one class or to the other, according to the diverse experience of different readers.

The apologue, however, has been worked out in one direction, as to the character of which there can be no dispute. This development constitutes what has been called the Æsopean Fable, in which the imagined actors, or the chief of them, instead of being men, are the lower animals, and sometimes plants or other things really inanimate. This shape of the fable arose in very early times, probably among the Eastern nations; and, passing thence to Greece and Rome, it flourished also profusely in the middle ages. We read of its having become, more than once, an instrument of persuasion in the hands of public men, who aimed at fitting their oratory to the grasp of a semi-civilized people: one instance, probably the oldest of which any record exists, is that which was above referred to, from the Book of Judges; another occurred when the Roman Menenius Agrippa told his tale of the members of the body to the plebeians on the Sacred Mount. In regions widely distant from each other, and in very remote ages, the fable took also a literary shape. It was used for many centuries as a favourite vehicle for the inculcation of rules of practical action, as well as for the venting of satire political and social; and even in modern times it has not altogether lost its ground, having been employed, not unfrequently, and oftenest in the form of verse, for insinuating the minor morals, or for giving point to epigrammatic and stinging jests. It should be noted, indeed, that the nature of the apologue proper unfits it for effectively symbolizing high ethical doctrines: to positions giving occasion for such teaching, its animal or inanimate actors cannot well be made to rise, unless by a looseness of invention that would degenerate into extravagance and absurdity. Accordingly, the framers of apologues have at all times been tempted to wander beyond their own field. In many of the most striking and celebrated fables, the introduction of the animal personages is merely ornamental, the action and its lesson turning really on the thoughts and conduct of human beings who appear along with them; nor is there, perhaps, any extensive collection of fables, whether ancient or modern, invented or compiled, in which an attempt is not made to relieve the monotony by the interspersion of stories having men only as their actors.

It is not probable that we possess any Oriental Apologues, in the state in which they were received by the Greeks. But there are many extant specimens which are very ancient, and which likewise have reached us without any loss of the native Eastern colouring. The most famous of these are contained in the various shapes and versions of a collection, which was long known as the Fables of Pilpay. Hindustan was the birth-place, if not of the originals of these tales, yet certainly, at least, of the oldest shape in which they still exist. The source of all of them is the Sanscrit book called the Pancha Tantra, or Five Sections. It has been analysed by Professor H. H. Wilson in the Transactions of the Asiatic Society; and the Hitopadesa, an alteration of it in the same language, was translated into English by Wilkins. The stories of both works are told in prose, but reflections in verse, chiefly quotations, are interspersed freely. The fables which they contain reached Europe in the middle ages, through translations from an Arabic version (long lost), usually called the "Kalila Damana," from the names of two jackals who figure prominently in it; and the name Bidpai, there given to the wise man who is the story teller, has been changed into Pilpay. There exists in Arabic, also, a much more meagre collection of fables, attributed traditionally to Lokman, who is said to have lived in the time of King David.

The Sanscrit Fables bear the Hindu impress very strongly. The animals, the scenery, and the aspect of society, are all genuinely Indian; and not a few features image vividly the ancient state of Indian greatness and independence. One of the names of the older form of the collection signifies "The Book of Polity;" and the tales are feigned to have been told by a learned Brahmin to the sons of a great king or raja, the education of whom had been committed to him, and was to be effected chiefly through the weighty lessons of wisdom and morality thus communicated. Many stories which afterwards in European hands assumed a domestic and familiar cast, are here invested with royal and aristocratic pomp; the several kinds of animals have their several kingdoms, mixed up together by whimsical borrowings and dependences; and the picture is often embellished also with wild mythological groups. Among other tales found in the collection, which are not properly fables, are the originals of the Arabian Alnaschar, of the story versified in Bethgelert, and of several of the French fabliaux.

The Æsop of the Greeks, the hunchbacked slave and jester, is very like the Lokman of the Arabs; and of the fables which were current in Greece under his name not a few are identical with those of the East. As to all of them, it is quite uncertain who may have been the author or compiler; but Fables attributed to Æsop are quoted, in prose, by Xenophon, Aristotle, Plutarch, and other Greek writers; and Plato represents Socrates as having versified some such in the time of his imprisonment. Babrius or Babrias, who appears to have lived not long before the Augustan age

turned a large number of Æsopean Fables into Greek choliambic verse; and, after these had long been known in fragments only, most, if not all of them, were recovered in a manuscript found in a monastery of Mount Athos in 1844. The London edition of these, that of Sir G. C. Lewis, contains a hundred and twenty-nine fables. They are equal to those of Phædrus for brief expressiveness of phrase, and superior in the apposite pointedness with which, in most of them, the incidents are brought to bear on the moral. It may be worth noting that Babrias introduces the tiger, who, though very prominent in the Oriental apologues, had for a while lost his place among the Greeks. But he leaves the lion in possession of his sovereignty over the brutes; a feature, by the way, whose appearance in the more recent fables is one decisive symptom of their Oriental origin.

To this little corner of literature the Romans certainly supplied nothing better than the one fable, that of the Town Mouse and Country Mouse, told so tersely by Horace in one of his satires. But to the same age belong, not unworthily, the Fables of Phædrus, about ninety in number. They tell, in the easy iambic verse of comedy, and with a grace of style not surpassed by any other Augustan writer, stories, for the invention of which the fabulist professes himself to be indebted to Æsop, and most of which are generally of the Æsopean kind. There is, however, much originality in details. Even when his outline seems to be clearly traceable to some of the Greek stories still accessible, Phædrus often alters very skilfully, for the purpose either of giving a more natural or lively air to the picture, or of fitting the incidents more closely to the moral; and almost everything seems to be his own that strikes us most, in the light touches of characterization, and the occasional strokes of quiet humour. If the extreme brevity which he maintains throughout does sometimes give bareness and dryness to his scenes, it has opened to him the occasions which most of all bring out his mastery of language, while sometimes also it enables him to exhibit much force in concentrating both thought and imagery. A critic who deals very severely with Phædrus has been compelled to allow the excellence of the following fables, which indeed may be taken as fair specimens of his characteristic merits: the Ass and the Old Shepherd (i. 15); the Weasel and the Man (i. 22); the Mule and the Robbers (ii. 7); the Bees and the Drones (iii. 13); the Cicada and the Owl (iii. 16); the Huntsman and his Dog (v. 10).

The Fables of the rhetorician Aphthonius in Greek prose, and those in Latin elegiac verse, attributed to Avianus or Avienus, make, in the history of the apologue, a sort of link between the classical and the dark ages. In that overflowing chaos, which constitutes the literature of the middle ages, the fable reappears in several aspects. In a Latin dress, sometimes in prose, sometimes in regular verse, and sometimes in rhymed stanzas, it contributed, with other kinds of narratives, to make up the huge mass of stories which has been bequeathed to us by the monastic libraries. These served more uses than one. They were always easier reading, and were often held to be safer and more instructive reading also, than the difficult and slippery classics, for those monks who cared for reading at all, and were not learned enough for any pursuit deserving the name of study. For those who were a little more active-minded, they aided the *Gesta Romanorum* and other collections of fabliaux or short novels, in suggesting illustrations available for popular preaching. Among those mediæval fables in Latin, very little of originality is to be detected. The writers contented themselves with working up the old fables into new shapes, with rendering from prose into verse, or from verse into prose; a kind of attempts which had its merit in such hands as those of Babrias or Phædrus, but from which no fruit could be expected to be gathered in the convents. The few monks who could have performed such a task well, aimed wisely at something higher. It might be enough to name, among the monkish fabulists, Vincent of Beauvais, a Dominican of the twelfth century, in whose *Speculum Doctrinale* are a good many prose fables, more than half of them from Phædrus. About the end of the same century, too, a considerable number of fables, some of which have been printed, were compiled by an English Cistercian monk, Odo de Cerinton. Nor was this the only collection that arose in England.

As the modern languages became by degrees applicable to literary use, fables began to appear in them. There still exist, in Norman-French, a good many: of which may be noted the fables called those of Ysopet, and those composed by Marie de France, the authoress of the well-known fabliaux. Later, also, they were not wanting, though not numerous, in our own tongue. Chaucer has given us one, in his story of Chaunteclere and Dame Partelet; another is Lidgate's tale of The Churl and the Bird. But the course of the short and isolated fables through the middle ages is not here worth prosecuting.

Several of Odo's tales, like Chaucer's Æsopean story, must have been derived from some shape or other of a work, or series of works, for the sake of which chiefly the mediæval history of the apologue is interesting. This was the History of Reynard the Fox. Grimm has traced, to as early a date as the middle of the tenth century, the earliest of some extant stories in Latin verse, out of which arose the later poems on the theme, composed in the spoken tongues. The oldest of these was written in High German, probably in the twelfth century: not much later appeared a good many shorter poems in Norman-French; and a Low-German edition of the story "Reineke de Vos" (which has lately been shown to have been founded on an older Flemish original), exhibited the adventures in their fullest elaboration, and became, in its own shape and in translation, popular throughout all Europe. One of our venerable Caxton's labours was a version of a Dutch prose version of it, which he finished in 1481. By the German antiquaries and critics the "Reineke" has been treated with that somewhat overstrained enthusiasm which, since the beginning of the present century at least, they have bestowed so freely on the mediæval monuments of the father-land: a rendering of it into modern hexameters appears among the works of Goethe. It is really a very remarkable piece. In it the Æsopean fable received a development which was in several respects quite original. We have here no short and unconnected stories. Materials, partly borrowed from older apologues, but in a much greater proportion new, are worked up into one long and systematic tale, so as to form what has been quaintly called an animal-romance. The moral, so prominent in the fable proper, shrinks so far into the background, that the work might be considered as a mere allegory. Indeed, while the suspicion of its having contained personal satires has been convincingly set aside, some writers deny even the design to represent human conduct at all; and we can scarcely get nearer to its signification than by regarding it as being, in a general way, what Carlyle has called "a parody of human life." It represents a contest maintained successfully, by selfish craft and audacity, against enemies of all sorts, in a half-barbarous and ill-organized society. With his weakest foes, like Chaunteclere the Cock, Reynard uses brute force; over the weak who are protected, like Kiward the Hare and Belin the Ram, he is victorious by uniting violence with cunning: Bruin, the dull, strong, formidable Bear, is humbled by having greater power than his own enlisted against him; and the most dangerous of all the fox's enemies, Isengrim, the obstinate, greedy, and implacable Wolf, after being baffled by repeated strokes of malicious ingenuity, forces Reynard to a single combat, but even thus is not a match for his dexterous adversary. The knavish fox has allies worthy of him, in Grimbart the watchful badger, and in his own aunt Dame Rukenawe, the learned

She-ape; and he plays at his pleasure on the simple credulity of the Lion-King, the image of an impotent feudal sovereign. The characters of these and other brutes are kept up with a rude kind of consistency, which gives them great liveliness; many of the incidents are devised with much force of humour; and the sly hits at the weak points of mediæval polity and manners and religion, are incessant and palpable.

It is needless, as has already been said, to attempt tracing the appearance which fables, or incidents borrowed from them, make so frequently as incidental ornaments in the older literature of our own country and others. Nor is there here fit occasion for dwelling minutely on the cultivation of the apologue in modern times, as a special form of poetical composition. It has appeared in every modern nation of Europe, but has nowhere become very important, and hardly ever exhibited much originality either of spirit or of manner. In our own language, Prior indicated the possession of much aptitude for it; but neither the fables of Moore, nor even the much more lively ones of Gay, possess any distinguished merit. To Dryden's spirited remodellings of old poems, romances, and fabliaux, the name of fables, which he was pleased to give them, is quite inapplicable. In German, Hagedorn and Gellert are quite forgotten; and Lessing's fables, both in prose and in verse, are chiefly notable for hard thinking and cool satire. The Italian fables of Pignotti are much superior to all of those which have just been referred to.

It is only in France that the Fable has attained, in modern times, a literary position of real eminence; and it has owed this distinction to one writer, whose singular success has been sufficient alike to eclipse predecessors and to discourage all endeavours at imitation. La Fontaine, a man who, both in character and in intellect, was not unlike Goldsmith, was enabled by fortunate circumstances to concentrate his powers more vigorously; while the state of French society, and the turn of French opinions and feelings, brought out clearly some tendencies which in our man of genius were but imperfectly developed. La Fontaine's fables are, beyond all doubt, incomparably superior to everything else of their class. Of his extraordinary mastery in style and versification we foreigners can be only so far sensible, as to share, partly on trust, in the admiration felt for those excellencies by his countrymen. We can appreciate fully, in many instances, the rare pointedness and aptness of brief expression, clothing shrewd and striking apophthegms, which have given to so many of his lines and phrases a place in the common speech of educated men, like that which has been gained in our tongue by many fragments of Pope and by some of Shakspeare. The "Aide-toi et Dieu t'aidera," is but one example of a thousand. We can understand thoroughly, too, his unique mixture of sly sagacity, fine humour, and quiet reflectiveness, with a simplicity, and good-heartedness, and tenderness, which are best describable by the words of his own language—"naiveté" and "bonhommie." The outlines of his stories are chiefly borrowed from Phædrus, Avienus, and the older French fabulists. But among his two hundred and fifty fables there are certainly some whose idea was his own: there has been cited, as one undoubted instance, the ingenious device which he uses in "L'Homme et son Image," for paying a delicate compliment to Rochefoucault. He has, likewise, inexhaustible variety of invention in the filling up of details by original touches, both of incident and of description. Sometimes these are applied merely for giving liveliness and reality to the picture; at other times they suggest humorous images of contrast, as when the lion is described as holding court in his "Louvre," and as issuing his proclamations, "De par le Roi." Often, again, the originality lies in the increase of pointedness and wit with which he throws out the epigrammatic lesson of the old story; a feature which may be exemplified in "L'Ours et les Deux Compagnons," "Le Renard, Le Singe, et Les Animaux," and the tale from Phædrus of "Le Vieillard et L'Ane." He occasionally remodels fabliaux and similar anecdotes; being prompted by a desire both for diversity of incident and for opportunities of insinuating maxims not easily wrapt up in the apologue proper, either because they rise somewhat high in morals, or because they bear on complicated relations of modern society. Some such deviations from the path of the fable are apologized for in light and sparkling passages; as in the introductions to "Tyrcis et Amarante" and "Le Dépositaire." His personal feelings are often brought gracefully into play, and nowhere perhaps so beautifully as in the sentimental reflections which close "Les Deux Pigeons." His favourite manner of narration is broad, garrulous, and studded with particulars; and it thus escapes from the bareness which often chills us in Phædrus. But this fulness is not always unattended by superfluity: "in many of his fables he beats round the subject, and misses often before he hits." This is a remark of Mr Hallam's; who observes, also, that the moral of the tale is kept more directly in view by La Fontaine than by Phædrus. It must be said, however, that the abundance of features sometimes obscures the moral, or suggests, besides the moral which the poet chooses to draw, other inferences both more important and more obvious. The latter case is instanced in "Le Cochon, La Chèvre, et Le Mouton," and "L'Homme et La Couleuvre." Yet, even in such stories, there occurs often a slily good-humoured hint, which shows that the writer had his eyes open. Indeed there is hardly any piece of the collection, that fails to evince the loving zeal which the simple-hearted fabulist lavished on these his favourite works: the general equality of merit among them is very striking; and further, of those which are deformed by faults lying on the very surface, there is not perhaps one which, on narrower scrutiny, does not disclose some counterbalancing beauty of thought or of expression. Thus we have the rich Hermit-Rat ("Le Rat qui s'est retiré du Monde"), who, on an appeal from the starving community of his race, offers his prayers but refuses charity; an incident in the conception of which the idea of animal nature is quite lost sight of. But this very poem has been warmly admired; and the admiration is richly merited by the fine irony, for which the poet has carefully prepared himself in the opening of the story, and which he utters in its close with his most felicitous smile of gay and well-bred satire. (W. S.)

FABRETTI, Raffaele, a celebrated Italian antiquary, was born in 1619, at Urbino, in the States of the Church. At an early age he was sent on important political affairs into Spain; and, on his return, was appointed in rapid succession secretary of the memorials, canon of the Vatican, and keeper of the archives in the Castle of St Angelo, by the Popes Alexander VIII. and Innocent XII. Much of his spare time he devoted to the study of antiquities, and in this pursuit he examined with minute care the numerous monuments and inscriptions of the Campagna. He always undertook his antiquarian expeditions alone, on a horse which his friends nicknamed Marco Polo, and which became so habituated to its master's ways, that it used to stop of its own accord before the objects of which he was in quest, and indeed often rendered him good service by halting in this way before interesting remains which escaped his own eye. In 1680 he published his treatise *De Aquis et Aquæductibus Veteris Romæ;* in which his interpretations of certain passages in Livy and other classics involved him in a dispute with Gronovius, which in its general conduct bore a strong resemblance to that waged between Milton and Salmasius. His other works—*De Columna Trajani*, 1683; and *Inscriptiorum Antiquarum Explicatio*, 1699—throw much light on Roman antiquity, especially with the aid of the principle which he himself employed, of making one monument interpret another. Fabretti died at Rome early in the year 1700.

FABRIANO, Gentile da, an historical painter, was born at Verona in 1332, and became a disciple of Giovanni da Fiesole. He soon acquired a considerable reputation, and was employed to adorn a great number of churches and palaces at Florence, Urbino, Siena, Perugia, and Rome. His picture of the Virgin and Child attended by Joseph, which is preserved in the church of Santa Maria Maggiore, was highly commended by Michael Angelo. At the request of the doge and senate of Venice he painted a picture in the great council-chamber, which was considered so excellent that his employers granted him a pension for life, and conferred upon him the highest honour of their state, namely, the privilege of wearing the habit of a Venetian noble. He died in 1412.

FABRIANO, a city in the delegation of Macerata, Papal States, is situated on the right bank of the Giano, 29 miles W. of Macerata. It has a cathedral and numerous convents, and considerable manufactures of paper and parchment. Pop. about 6000.

FABRICIUS, George, a Latin poet and historian, was born at Chemnitz in Germany, on the 24th April 1516. He began his studies in his native place, and completed them at Freyberg and at Leipzig, where he was preceptor to Wolfgang, and also to Philip and Antony, Werter. He travelled into Italy with the elder of his pupils; and on his return to Germany, in 1553, was appointed director of the college of Meissen, where he died on the 13th July 1571. In his sacred poems, which obtained for their author considerable distinction, he affected not to employ any word which had the slightest savour of paganism; and he blamed those poets who had in their works introduced the pagan divinities. The following list includes the principal works which he published, either as author or as editor: 1. *Terentii Afri Comœdiæ sex cum castigatione duplici Joannis Rivii et G. Fabricii*, Strasburg, 1548, in 8vo; 2. *Roma, sive Liber utilissimus de veteris Romæ situ, regionibus, viis, templis, aliisque ædificiis*, Bâle, 1550, in 8vo; 3. *Virgilii Opera cum commentariis Servii et T. C. Donati*, Bâle, 1551, in fol.; 4. *Virgilii Opera a Fabricio castigata*, Leipzig, 1551, 1591, in 8vo; 5. *Poëmatum Sacrorum libri quindecim*, Bâle, 1560, in 16mo; 6. *Poëmatum veterum ecclesiasticorum opera Christiana et operum reliquiæ ac fragmenta*, 1562, in 4to; 7. *De Re Poëtica libri septem*, 1566, in 8vo; 8. *Rerum Misnicarum libri septem*, 1569, in 4to; 9. *Originum illustrissimæ stirpis Saxonicæ libri septem*, 1597, in fol.; 10. *Rerum Germaniæ magnæ et Saxoniæ universæ memorabilium volumina duo*, Leipzig, 1609, in fol.

Fabricius, or *Fabrizio, Jerome*, surnamed *Acquapendente*, from his having been a native of the episcopal city of that name in Italy, where he was born in 1537. His parents, though poor, were desirous to give their son an excellent education, and with this view sent him to Padua, where the young Fabricius soon found powerful protectors to assist in the cultivation of his talents. After completing his course of philosophy, he applied himself to medicine, which he studied under the celebrated Fallopius, and soon became the most distinguished pupil of that learned professor, whom he afterwards succeeded. Fallopius having died in 1562, Fabricius, then only twenty-five years of age, was at first employed merely to give anatomical demonstrations; but he discharged this duty with so much zeal and ability that, in 1565, he was formally promoted to the chair of surgery, whilst that of anatomy, which had hitherto been considered as merely a dependence or accessory of the other, was declared primary in favour of Fabricius, to whom were also assigned very considerable appointments. And to these preferments the senators of Venice added the highest distinctions which it was in their power to bestow. They granted him privileges not less extraordinary than flattering, gave him precedence of the professors of philosophy, named him citizen of Venice, honoured him with a statue and a gold chain, decorated him with the order of knight of St Mark, constructed a superb anatomical theatre for his accommodation, and assigned him a liberal retiring allowance, with the right of naming his successor. Fabricius practised his profession with much dignity and with rare disinterestedness. Persons of high rank, who were indebted to him for the re-establishment of their health, made up by rich presents for the fees which the generous physician refused; and these Fabricius collected in a cabinet, on the door of which he caused to be inscribed the words *Lucri neglecti lucrum*. He possessed a beautiful country-house, situated on the delightful banks of the Brenta, and still known by the name of *Montagnuola d'Acquapendente*, where, sound in body and mind, loaded with riches, generally esteemed, and enjoying a brilliant reputation, he calculated on spending a happy old age; but his expectations were cruelly disappointed, and his repose was disturbed by envy and ingratitude. It is even said that on more than one occasion he had to defend himself against violent attempts on his life, which even in his own house was not secure. Relations, on whom he had never ceased to lavish favours, unworthily betrayed his confidence, and are suspected, not without reason, of having abridged his days by means of poison. Having attained the age of eighty-two, he died suddenly, in an agony of vomiting, on the 21st May 1619, leaving to his niece a fortune of two hundred thousand ducats, and to the republic of letters the following works, which are much esteemed: *De Visione, Voce, Auditu*, Venice, 1600, in fol.; *De formato Fœtu liber*, Venice, 1600, in fol.; *De Venarum ostiolis*, Padua, 1603, in fol.; *De Locutione et ejus instrumentis*, Venice, 1603, in 4to; *De Brutorum loquela*, Padua, 1603, in fol.; *De Musculi artificio ac Ossium dearticulationibus*, Vicenza, 1614, in 4to; *De Motu locali Animalium secundum totum*, Padua, 1618, in 4to; *De Respiratione et ejus Instrumentis libri duo*, Padua, 1615, in 4to; *De Gula, Ventriculo, Intestinis*, Padua, 1618, in 4to; and also, *De totius Animalis integumentis*, Padua, 1618, in 4to. These different fragments were collected and printed by Bohn, with a preface, under the title of *Opera omni Anatomica et Physiologica hactenus variis locis ac formis edita, nunc vero certo ordine digesta, et in unum volumen redacta*, Leipzig, 1687, in fol. But the Leyden edition, published in 1738, by Bernard-Siegfred Albinus, is preferred to that of Bohn, as containing a life of the author, and the prefaces of the different treatises, which Bohn had unaccountably suppressed. All the writings of Fabricius are truly classical, and fully justify the high reputation of their author. His style is pure, and even elegant; the language of Hippocrates was as familiar to him as that of Celsus; and lucid order pervades all his writings. In regularity of plan and clear luminous method he is unsurpassed. "On a reproché à ce grand chirurgien trop de timidité dans l'exercice de son art, et pourtant nous le voyons," says his French biographer, "pratiquer et perfectionner le trépan, employer avec autant de hardiesse que de talent le bistouri, l'aiguille, le trois-quarts, la rugine et même le fer rouge, quoiqu' en dise Severino. Haller, qui, certes, ne le juge pas avec bienveillance, est forcé de lui rendre justice sur ces divers points." In a word, Fabricius was one of the greatest ornaments of the university of Padua, and one of the most celebrated anatomists and surgeons of the sixteenth century. (J. B—E.)

Fabricius, *Joannes Albertus*, one of the most learned, laborious, and useful of bibliographers, was born at Leipzig, November 11th, 1668. He lost his mother in 1674, and five years afterwards his father, Werner Fabricius, director of music in the church of St Paul at Leipzig, and author of several works, particularly *Deliciæ Harmonicæ*, published in 1657. Joannes Albertus himself commenced his studies under his father, who on his deathbed recommended him to the care of Valentine Alberti. He studied during five years

Fabricius. under Wenceslaz Buhl, and afterwards for some time under J. S. Herrichen; and in 1684 he was sent to Quedlinburg, there to continue his studies under Samuel Schmidt. Having returned to Leipzig in 1686, he was the same year admitted bachelor in philosophy; and in the beginning of 1688 he took the degree of master in the same faculty. He then applied himself to the study of medicine, which, however, he relinquished for that of theology; and having gone to Hamburg in 1693, he proposed to travel abroad, when the unexpected tidings that the expense of his education had absorbed his whole patrimony, and even left him in debt to his trustee, forced him to abandon his project. He therefore remained at Hamburg, where J. F. Mayer employed him in the capacity of librarian. In 1696 he accompanied his patron to Sweden; and, on his return to Hamburg, not long afterwards, he competed for the chair of logic and philosophy. The suffrages being equally divided between Fabricius and Sebastian Edzardi, one of his opponents, the appointment was decided by lot in favour of Edzardi; but in 1699 Fabricius succeeded Vincent Placcius in the chair of rhetoric and ethics, after which he took the degree of doctor in theology at Kiel. In 1701, J. F. Mayer, having established himself at Greifswald, caused the chair of theology in that city to be offered to Fabricius, who, however, refused it on account of his health. But in 1708 he accepted the professorship of theology, logic, and metaphysics, and was preparing to enter on his new office, when the senate of Hamburg induced him to remain, by adding to his charge as professor that of rector of the school of St John, then held by his father-in-law, Schultz. Schultz died in 1709, but Fabricius retained the rectorship two years longer. In 1719 the landgrave of Hesse-Cassel made him so advantageous an offer, that Fabricius was on the point of accepting it; but this time also the magistrates, by a seasonable increase of salary, prevailed on him to remain amongst them. An attempt was subsequently made to draw him to Wittenberg. But Fabricius refused to listen to the proposals which were made to him, and remained at Hamburg, where he died April 30th, 1736.

Besides the time which he had devoted to the duties of his office, Fabricius spent a considerable portion in maintaining an extensive correspondence, and in receiving the visits of foreigners; but he was so laborious that he was nevertheless the author of a great number of works, the list of which, according to Niceron and Reimar, includes as many as a hundred and twenty-eight. It will be sufficient here, however, to indicate the most remarkable of these, which are, 1. *Scriptorum recentium Decas*, Hamburg, 1688, in 4to; 2. *Decas Decadum, sive Plagiarorum et Pseudonymorum centuria*, 1689, in 4to; 3. *Bibliotheca Latina, sive notitia Auctorum veterum Latinorum quorumcunque scripta ad nos pervenerunt*, Hamburg, 1697, in 8vo, a work which was republished in an improved and amended form by J. A. Ernesti, Leipzig, 1773, in 3 vols. 8vo.; 4. *Bibliotheca Græca, sive notitia Scriptorum veterum Græcorum quorumcunque monumenta integra aut fragmenta edita extant, tum plerorumque e manuscript. ac deperditis*, Hamburg, 1705–1728, in 14 vols. 4to, a work which has justly been denominated *maximus antiquæ eruditionis thesaurus*; 5. *Centuria Fabriciorum scriptis clarorum qui jam diem suum obierunt*, 1705, in 8vo, and a second Century in 1727; 6. *Bibliotheca Antiquaria sive Introductio in notitiam Scriptorum qui antiquitates Hebraicas, Græcas, Romanas, et Christianas scriptis illustrarunt*, 1713 and 1726, in 4to; 7. *Centifolium Lutheranum, sive notitia literaria Scriptorum omnis generis de B. D. Luthero*, 1728 and 1730, in 8vo; 8. *Conspectus Thesauri Litterarii in Italia, præmissam habens præter alia notitiam Diariorum Italiæ litterariorum thesaurorumque ac corporum historicorum et academiarum*, 1730, in 8vo; 9. *Delectus argumentorum et syllabus Scriptorum qui veritatem religionis Christianæ adversus atheos, Epicureos, deistas seu naturalistas, idolatras, Judæos et Muhammedanos lucubrationibus suis asseruerunt*, 1721, in 4to; 10. *Salutaris lux Evangelii toti orbi per divinam gratiam exoriens, sive notitia historico-chronologica, literaria ac geographica propagatorum per orbem totum Christianorum sacrorum*, 1731, in 4to; 11. *Hydrotheology*, in German, 1734, in 4to; 12. *Bibliotheca Latina mediæ et infimæ Latinitatis*, 1734–1756, in 5 vols. 8vo. The principal works edited by Fabricius were, 1. *Vincentii Placcii theatrum anonymorum et pseudonymorum*, Hamburg, in two vols. fol.; 2. *Joannis Mabillonii iter Germanicum, et Joannis Launoii de Scholis celebribus a Carolo Magno et post Carolum Magnum in occidente instauratis liber*, 1717, in 8vo; 3. *Anselmi Bandurii Bibliotheca Nummaria*, 1719, in 4to; 4. *Danielis Georgii Morhofii Polyhistor litterarius, philosophicus, ac practicus, cum accessionibus Joannis Frikii et Joannis Mollerii*, 1732, in two vols. 4to; 5. *Bibliotheca Ecclesiastica*, 1718, in fol.; 6. *Codex apocryphus Novi Testamenti collectus, castigatus, testimoniisque, censuris et animadversionibus illustratus*, 1703, in two vols. 8vo; 7. *Codex pseudepigraphus Veteris Testamenti collectus, castigatus, testimoniisque, censuris et animadversionibus illustratus*, 1713 and 1722, in two vols. 8vo.

Fabricius. FABRICIUS, *Johann Christ*, the most celebrated entomologist of the eighteenth century, was born at Tundern, in the duchy of Sleswick, in 1742. After having completed his studies, at the age of twenty he repaired to the university of Upsal, to attend the prelections of Linnæus. How long he remained there is uncertain; but no pupil was ever more indebted to the lessons of his master than Fabricius. All his works on entomology, which have secured to him a well-merited reputation, indicate the precepts, the method, and even the forms of Linnæus, applied to the development of a single new idea, not more fortunate in conception than fruitful in its consequences. Far from disguising the obligations which he owed to his master, Fabricius delighted to expatiate on the happy moments which he had passed in the society of Linnæus; and the grateful scholar has transmitted to us those biographical details, which are not only the most interesting in themselves, but at the same time best fitted to give us an insight into the character of the great naturalist. It was in studying under this master that Fabricius conceived the idea of his system, and formed the project of his labours on insects. The first insect's mouth which he dissected was that of a cockchafer (*Scarabæus stridulus*); he showed it to Linnæus, with the description he had made of it, and proposed to him to employ the organs of the mouth in order to establish the characters of insects, in the new edition of the *Systema Naturæ* which Linnæus was then preparing. The latter encouraged his pupil to pursue this course, but refused to enter on it himself, because, as he said, he was too old to change his method. Forced to choose a profession, Fabricius studied medicine, and at the age of twenty-five took the degree of doctor in physic; but being soon afterwards appointed professor of natural history in the university of Kiel, he devoted himself entirely to his favourite pursuits, and in 1775 published his system of entomology. This work gave a new aspect to the science. Swammerdam and Ray had classed insects according to their metamorphoses; Lister, Linnæus, and Geoffroy, carrying out a suggestion of Aristotle, according to the organs of motion; and some entomologists, as Réaumur, Scopoli, and even Linnæus himself, had employed the nutritive organs in order to characterize distinctively certain genera. But before the time of Fabricius no one had thought of making these the basis of a general classification. This idea was at once new and bold, and the author evolved it with singular ability. In a second work, which he published two years afterwards, he developed the characters of the classes and genera, showing in the preface the advantages of his method, and at the same time excusing its inconveniences. Lastly, in 1778, he published *Entomological Philosophy*, in imitation of the *Botanical Philosophy* of Linnæus; and from this period till his death, that is during the space of more than thirty years, he was incessantly occupied in extending his system, which he reproduced under different forms in the various works which, from time to time, he gave to the world. But in proportion as the number of species increased, the characters of the *genera*, and even of the classes, became more and more uncertain and arbitrary; and with reference to this fundamental point, his later writings are perhaps inferior to those which preceded them. The basis which he had assumed was excellent; but it could only conduct him to a *natural method*, not, as he supposed, to a *system*; and this misconception led him to neglect other considerations which would

have furnished more exact means of classification. Fabricius had a very extensive knowledge of botany, and of the other branches of natural history. He had been appointed counsellor of state to the king of Denmark, and professor of rural and political economy; in which capacity he published, in German and in Danish, several useful works, though much less celebrated than those which appeared from his pen on the subject of entomology. Fabricius died in 1807, at the age of sixty-five, of a melancholic affection, produced, as is alleged, by the bombardment of Copenhagen.

The following is a list of his works:—1. *Systema Entomologiæ*, Flensburg, 1775, in 8vo; 2. *Genera Insectorum*, Kiel, 1776, in 8vo; 3. *Philosophia Entomologica*, Hamburg, 1778, in 8vo; 4. *Species Insectorum*, ibid. 1778, in 2 vols. 8vo; 5. *Mantissa Insectorum*, Copenhagen, 1787, in 2 vols. 8vo; 6. *Nova Insectorum Genera*, in Mem. of the Soc. of Nat. Hist., Copenhagen; 7. *Entomologia Systematica*, Copenhagen, 1792–1796, in 7 vols. 8vo; 8. *Supplementum Entomologiæ Systematicæ*, ibid. 1798, in 8vo; 9. *Systema Eleutheratorum*, Kiel, 1801, in 2 vols. 8vo, with an index; 10. *Systema Rhyngotorum*, Brunswick, 1803, in 8vo; 11. *Systema Piezatorum*, ibid. 1804, in 8vo; 12. *Systema Antliatorum*, ibid. 1805, in 8vo; 13. Description of the *Tipula Sericea* in the Berlin Mem., tome v.; 14. *De Systematibus Entomologicis*, in the same collection; 15. *Considérations sur l'ordre général de la Nature*, Hamburg, 1781, in 8vo; 16. *Traité de la Culture des Plantes à l'usage des cultivateurs*; 17. *Observations sur l'engourdissement des Animaux durant l'hiver*, inserted in the *Mag. de Physique*, tom. ix., 79; 18. *Résultat des Leçons sur l'Histoire Naturelle*, Kiel, 1804, in 8vo; 19. *Sur l'accroissement de la Population, particulièrement en Danemark*; 20. *Eléments d'Economie Politique à l'usage des étudiants*, Flensburg, 1775, in 8vo; 21. *Renseignements Historiques sur le Commerce du Danemark*; 22. *Hvori bestaaer Borgendyd besvaret*; In what consists civic virtue? Copenhagen, 1786, in 8vo; 23. *Sur les Finances et la Dette en Danemark*; 24. *Recueil d'Ecrits sur l'Administration*, Kiel, 1786, and 1790, in 2 vols. 8vo; 25. *Sur les Académies, particulièrement en Danemark*, Copenhagen, 1796, in 8vo; 26. *Voyage en Norwège*, Hamburg, 1799, in 8vo; 27. *Lettres sur Londres*, Leipzig, 1784, in 8vo; 28. *Lettres au sujet d'un voyage fait en Russie*; 29. *Remarques Minéralogiques et Technologiques*; 30. *Remarques sur le Danemark*, written in English, and published by Pinkerton in his *Modern Geography*, 1807.

FABROT, Charles-Annibal, one of the most celebrated jurisconsults of his time, was born in 1580, at Aix in Provence. At an early age he made great progress in the ancient languages and in the civil and the canon law; and in 1609 obtained a professorship in the university of his native town. He is best known by his translation of the *Basilica*, which may be said to have formed the code of the Eastern empire till its destruction. This work was published at Paris in 1647, in 7 vols. fol., and obtained for its author a considerable pension from the Chancellor Seguier, to whom it was dedicated. Fabrot likewise rendered great service to the science of jurisprudence by his edition of Cujas, which comprised several treatises of that great jurist previously unpublished. Among Fabrot's other works, may be mentioned his *Epistola de Mutuo cum responsione Cl. Salmasii ad Menagium*, Leyden, 1645, in 8vo; *Les Antiquités de la Ville de Marseille*, translated from the Latin of J. Raymond de Solier, Marseilles, 1615, and Lyons, 1632, in 8vo; *Exercitationes duæ de tempore partûs humani et de numero puerperii*, Aix, 1629, in 4to; *Prælectio in titulum Decretalium "De vita et honestate Clericorum,"* Paris, 1651, in 4to; *Notæ at titulum Codicis Theodosiani*. "*De paganis sacrificiis et templis*," Paris, 1648, in 4to.

FABYAN, Robert, an ancient English chronicler, was sprung from a respectable family in Essex, and is believed to have been born in London about the middle of the fifteenth century, though no records remain by which the events of his early life can be assigned to any precise date. The first fact in his history known for certain is, that he was alderman for the ward of Farringdon-Without; and in 1493 he was appointed to the office of sheriff. In 1502, though he is believed on good grounds to have been very rich, he resigned the former of these two offices on the score of poverty, not wishing probably to be elected to the expensive position of Lord Mayor, as he had a very numerous family. Stowe, in his *Survey of London*, states that Fabyan died in 1511; but Bayle, probably with more correctness, assigns that event to the following year. Fabyan's Chronicle embraces the history of England from the time when "Brute entryd firste the Ile of Albion" to the year 1485; and in subsequent editions was continued by unknown authors to the year 1559. There have been five editions of the work, the first of which was printed in 1516 by Pynson, and, as Wolsey ordered many copies of it to be buried, is now very rare; the second by Rastell in 1533; the third by Reynes in 1542; the fourth by Kyngeston in 1559. The fifth, in the preparation of which all the previous editions were compared, was published by Sir Henry Ellis in 1811. The first edition had no regular title; later ones bore the title of the *Concordance of Histories*, it being Fabyan's object to reconcile in his work the conflicting narratives of previous historians. The title of the last edition is "*The New Chronicles of England and France*, in two parts, by Robert Fabyan, named by himself the *Concordance of Histories*."

FACCIOLATI, Jacopo, one of the best of modern Latin scholars, was born in 1682 at Toriggia, in the province of Padua. He published improved editions of several philological works, such as the *Thesaurus Ciceronianus* of Nizolius, the polyglot vocabulary known under the name of *Calepino*, and others. But his fame chiefly rests on his *Totius Latinitatis Lexicon*, 4 vols. fol., Padua 1771. In the compilation of this work the chief burden seems to have been borne by Facciolati's pupil Forcellini, to whom however the lexicographer allows a very scanty measure of justice, though the work occupied thirty years of his life. This lexicon is the best Latin dictionary that has hitherto been published in any country, and is so comprehensive that it has been remarked—that if the whole body of Latinity were now to perish, it might be restored from this work. Facciolati's mastery of Latin style as displayed in his epistles has been very much admired for its purity and grace. In 1722 Facciolati had been appointed professor of logic in the university of Padua, and despite the many flattering invitations he received to exchange this office for others still more honourable and lucrative, he continued to occupy that chair till his death in 1769, in the 88th year of his age.

FACIAL ANGLE. See Anatomy, vol. iii., 30.

FACIES HIPPOCRATICA, in *Medicine*, the peculiar expression of countenance which indicates the approach of death. The several peculiarities incident to this last stage of existence are minutely described by Hippocrates; whence the term.

FACTION (*factio*), a term applied in an ill sense to any party in a state that offers uncompromising opposition to the measures of the government, or that endeavours to excite public discontent upon unreasonable grounds.

Among the ancient Romans, the charioteers in the circus were divided into four parties (*factiones*), each distinguished by the colour of its dress. These factions were thence denominated the white, the red, the blue, and the green; to which Domitian added two more—the golden, and the purple. The spectators favoured one or the other, as humour or caprice inclined them; and it appears, according to Pliny (Ep. ix. 6), that they were more influenced by the gay accoutrements, than by the fleetness of the horses or the skill of the charioteers. It is related that in the time of Justinian no fewer than 30,000 men at Constantinople lost their lives in a tumult that arose among the partisans of these several colours.

FACTOR. See Agent.

Factor, in *Multiplication* and *Algebra*, a name given to the multiplier and multiplicand, or to each of the quantities which are multiplied into one another in order to *form* the product. See Arithmetic and Algebra.

FACTORY. See Manufactures.

Factory, in *Commerce*, a name given to establishments of merchants and factors in foreign countries, where they negotiate business for themselves and their employers. The British possess factories of this kind in China, Turkey, and other distant parts of the world.

FACULÆ, in *Astronomy*, certain spots occasionally seen on the disc of the sun. See Astronomy, iv., 28., &c.

FACULTY, in *Law*, a privilege granted to a person by favour or indulgence, to do that which by law he may not do. Thus the Archbishop of Canterbury has a court of faculties for granting certain privileges and dispensations; such as liberty to marry without the publication of banns, to ordain a deacon under age, &c.

Faculty, in a university, one of the particular departments of learning. In most universities there are four faculties; viz. that of arts (including humanity and philosophy); that of theology; that of medicine; and that of law. See Universities.

Faculty, *Dean of*. See Dean.

FAENZA, the ancient *Faventia*, a town in the delegation of Ravenna, Papal States, situated in a fertile plain at the junction of the canal of Zanelli with the Lamone, 20 miles S.W. of Ravenna. Pop. about 20,000. It is regularly built, and is surrounded by walls, and defended by a citadel. Around the market-place (a spacious square in the centre of the town, with a fine marble fountain) are ranged the cathedral, town-hall, theatre, and many handsome private residences. Faenza possesses numerous churches and monasteries, a lyceum, college, school of painting, hospital, and two orphan asylums. A kind of porcelain which has been supposed to take its name of *faience* from this town, one of the earliest sites of this peculiar product, still continues to be manufactured here, though not to such an extent as formerly. Faenza has also manufactories for spinning and weaving silk, some paper-mills, and a considerable trade by the Zanelli canal. Faventia is noted in history as the place where Carbo and Norbanus were defeated with great loss by Metellus, the general of Sulla, in B.C. 82. In the time of Pliny it was celebrated for its manufactures of linen, which was considered to surpass all other linens in whiteness. Torricelli the famous natural philosopher was born here.

FAERNUS, Gabriel, a distinguished modern Latin poet and critical scholar, was born at Cremona early in the sixteenth century, and died at Rome in 1561. His claims to distinction as an original author depend chiefly on his *Fabulæ Centum ex antiquis auctoribus delectæ*, which have been greatly admired for the purity and elegance of their diction and the skill which they show their author to have possessed in imitating the classical tone and modes of thought. Faernus rendered good service to literature by his edition of Terence, his notes on which were esteemed by Bentley so highly, that he incorporated them bodily in his own edition of that poet. His other works are not possessed of much intrinsic value.

FÆSULÆ (now Fiesole), in *Ancient Geography*, an important city of Etruria, situated on the side of a hill sloping down to the Arno, about three miles from Florence. It was a place of great antiquity, and in the old Etrurian times its inhabitants were famous for their skill in divination. Fæsulæ was a place of some note in the Gallic and Punic wars, and was afterwards selected by Sulla as a site for a colony of his veteran soldiers. These colonists, twenty years later, rendered themselves formidable to the Roman state by the support which they gave to Catiline when organizing his conspiracy, and the town itself was selected by the leader of the revolt for his head-quarters in his attempt to maintain himself against the armies of Metellus and Antony. The story of Catiline and his exploits became engrafted on the early legendary history of Florence, in which his memory is still preserved as that of a national hero. From this time Fæsulæ gradually sank in importance, and though it offered a protracted and vigorous resistance to the arms of Belisarius, it finally fell into decay before the increasing power and prosperity of the adjoining Florence. It is said to have been finally destroyed by its powerful neighbour in the beginning of the eleventh century; but this is a point still contested among historians. The modern Fiesole is a small town with about 2400 inhabitants. It still retains, however, its ancient rank as an episcopal city; and its cathedral is a handsome building adorned with some good paintings and pieces of sculpture.

FAGGING, a term used more particularly to denote a degrading species of servitude still (1855) authorized at Eton, and perhaps imitated in one or two other schools, by which the junior boys (or those of the lower school as it is called) are compelled to act in the capacity of servants, or "fags," to the older or more advanced pupils. Several attempts have of late years been made to abolish this remnant of barbarism,—a reform, it is to be hoped, that will soon be effected.

FAGGOT, a bundle of sticks or small branches of trees bound together. The faggots used in fortification, for raising batteries, filling ditches, &c., are termed *fascines*.

In times of religious persecution, the faggot was used as a badge, worn on the sleeve of the upper garment, to mark that the wearer had recanted or abjured his obnoxious opinions, and had done penance by carrying a faggot to some place appointed for the occasion.

The term faggot was also formerly a cant phrase in the army for a person hired to appear at musters, in order to conceal the deficiency of a company.

FAGUS, the beech. See Planting, and Timber.

FAHRENHEIT, Gabriel Daniel, well known for the modifications which he introduced in the construction of the thermometer and barometer, was born at Dantzic about the end of the seventeenth century. After engaging for some time in commerce, his inclination for natural philosophy induced him to relinquish business; and having travelled through Germany and England to enlarge his knowledge, he settled in Holland, where the most celebrated men in this branch of science—s'Gravesande and others—were his teachers and friends. In 1720 he first conceived the idea of substituting mercury for spirits of wine in the construction of thermometers—an improvement which greatly enhanced the accuracy of the instrument. He took as the limit of greatest cold that which he had observed at Dantzic during the winter of 1709, and which he could always produce artificially by a mixture of equal quantities of snow and sal-ammoniac. The space between the point to which the mercury fell at this temperature and that to which it rose in boiling water, he divided into 212 parts; and this distinguishes his thermometric scale from that of Réaumur.

During his residence in Holland, Fahrenheit employed himself in constructing a machine for draining the parts of the country exposed to inundations; for which he obtained a patent; but its full development was interrupted by the death of the inventor, which took place in 1740. The changes which s'Gravesande introduced (whom he had requested to complete the machine for the benefit of his heirs), rendered it so useless in the first trial that no further attempt was made to complete it. (See Thermometer, and Meteorology.)

FAIENCE, an old French term under which were comprised all descriptions of glazed earthenware, even inclusive of porcelain. The word is still employed in this sense, and corresponds in its general use to the English word crockery. The name is commonly supposed to be derived from Faenza; but it may well be doubted whether upon any authority much to be relied on, since neither historians nor topographers seem to have considered the matter worthy of their attention or examination. (Marryat *on Pottery*, p. 244.)

FAIFO, a town of Cochin-China, situated about ten miles from the sea, on a navigable river, fifteen miles south of Huron. It was at one time a place of some importance, with houses built of brick, and the streets regularly laid out. It was, however, destroyed in the course of the revolutions which took place in the country; but its prosperity is revived, and it is now a place of considerable trade.

FAINTING. See SYNCOPE.

FAIRS AND MARKETS. The intimate relation that subsists between these institutions renders it no less proper than convenient to treat of them together. A fair may be defined as only a greater species of market, which recurs at more distant intervals. Both are appropriated to the sale of one or more kinds of goods, the hiring of servants, labourers, &c. In most cases, however, fairs are more numerously attended than markets, and are generally characterized by various exhibitions got up for the amusement of the people.

The Anglo-Saxons are supposed to have derived their fairs from the Romans, who had established such marts in all their provinces.

The following account of fairs is given by Mr M'Culloch, in his *Dictionary of Commerce*. "Institutions of this sort are peculiarly serviceable in the earlier stages of society, and in rude and inland countries. The number of shops, and the commodities in them, are then either comparatively limited, or they are but little frequented by dealers; so that it is for the advantage of all that fairs should be established, and merchants induced to attend them. For this purpose various privileges have been annexed to fairs, and numerous facilities afforded to the disposal of property in them. To give them a greater degree of solemnity, they were originally, both in the ancient and modern world, associated with religious festivals. In most places, indeed, they are still held on the same day with the wake or feast of the saint to whom the church is dedicated; and till the practice was prohibited, it was customary in England to hold them in churchyards. (*Jacob's Law Dict.* art. *Fair.*) But since the growth of towns, and the opportunities afforded for the disposal and purchase of all sorts of produce at the weekly or monthly markets held in them, the utility of fairs, in this country at least, has very much diminished; they have also lost much of their ancient splendour; and, though some of them are still well attended, and of real use, a good number might be advantageously suppressed.

"But it is far otherwise in inland countries, where the facilities for carrying on commercial transactions are comparatively circumscribed. There it is of the utmost importance that certain convenient places and specified periods should be appointed for the bringing together of commodities and dealers. This is not only the readiest and best means of promoting commerce, but also of softening national antipathies, and diffusing a knowledge of the products, arts, and customs of other countries."

In England the right of holding a fair must be derived from the crown; and, in the grant obtained, provision is made that no other fair shall be injured by the one to be established. The times of holding the fairs are determined by the letters-patent appointing the fair or market, or by usage; and penalties are imposed if they are held beyond the time specified. A *bona fide* sale made in a fair or open market, in general transfers the complete property of the things sold to the vender, so that, however vicious or illegal the title of the vender may be, the vendee's is good against every one except the king. But the sale, in order to come within this rule, must be made on the market day, and at the place assigned for the market. Formerly the mayor or steward presided at a court called the court of *pié poudre*, in allusion to the dusty feet of the suitors, where questions as to contracts, &c. were decided; but these courts are now entirely set aside. Still, as of old, however, there is a clerk appointed, whose duty it is to see that every thing is sold according to just weights and measures. There is generally a toll attached to fairs and markets, which is paid by the buyer after the thing brought to the market has been sold. (For further information as to British fairs and markets, see Chitty *On Commercial Law*, vol. ii.)

British Fairs. Amongst these may be specified that of Stourbridge, in Worcestershire. Bristol has two considerable fairs, one in March and one in September. Exeter December fair is for cattle, horses, and most sorts of commodities. Weyhill fair, in Hampshire (October 10), has probably the greatest display of sheep of any fair in the kingdom. Bartholomew fair, in London, used to be of considerable importance, but is now appropriated only to shows of wild beasts, and such like exhibitions, and might be suppressed with advantage. St Faith's, near Norwich (October 17), is the principal English fair for Scotch cattle. They are sold to the graziers and feeders of Norfolk, Suffolk, Essex, and other counties, by whom they are fattened for the London markets, where the demand for them is very great. But besides those sold at St Faith's, large numbers of Scotch cattle are disposed of at Market-Harborough, Carlisle, Ormskirk, and other places. Ipswich has two considerable fairs; one in August for lambs, and one in September for butter and cheese; and it is reckoned that above 100,000 lambs are annually sold at the former. Woodborough-hill, in Dorset, is for west-country manufactures, as kerseys, druggets, &c.; and Woodstock October fair, for cheese. Northampton and Nottingham have each several large fairs, for horses, cattle, cheese, &c. The August fair of Horncastle, in Lincolnshire, is the largest horse fair in the kingdom, many thousand horses being exhibited for sale during its continuance; and it is resorted to by crowds of dealers from all parts of Great Britain, by several from the Continent, and sometimes even from North America. Howden, in Yorkshire, has also a very large horse fair, particularly for Yorkshire hunters. Devizes, in Wiltshire, has several large fairs for sheep and cattle. There is usually a large display of cheese at the Gloucester April fair. A guild, or jubilee, commencing the last week of August, is held every twentieth year at Preston, in Lancashire: the last was held in 1842, and was well attended. The October fair of Market-Harborough, Leicestershire, lasts nine days, and a great deal of business is usually done in cattle, cheese, &c. Woodbridge Lady-day fair is celebrated for the show of Suffolk horses. Falkirk fair, or tryst, is one of the most important in Scotland, for the sale of cattle and sheep. Hardly inferior are those of Melrose and Lockerby, which have of late years risen into great importance as lamb-markets, and that of Muir-of-Ord, near Beauly, in Ross-shire. The October fair of Ballinasloe, in the county of Galway, is famous for the display of cattle and sheep; by far the largest proportion of these animals raised for sale in Connaught being disposed of at it.

French Fairs. The principal French fairs are those of Beaucaire, St Germains, St Cloud, Poissy, Lyons, Rheims, Chartres, Rouen, Bordeaux, Troyes, and Bayonne; but they are said to have for the most part much fallen off. That of Beaucaire, however, which was formerly the greatest in Europe, is still attended by a vast concourse of people, not only from France, but also from many parts of southern Europe.

German Fairs. The principal German, or rather European fairs, are those of Frankfort on the Maine, Frankfort on the Oder, and Leipzig. The business transacted at these fairs is in general very great. Merchants of all nations are there assembled, for disposing of the manufactures, merchandise, and productions for which their several countries are distinguished. Frankfort on the Maine has two, and Frankfort on the Oder three fairs yearly. Leipzig has also three annual fairs, and these are by far the most cele-

brated. They are held on the first of January, at Easter, and at Michaelmas. The first is the least important. The two latter, particularly that at Easter, are remarkable for the vast number of new publications usually offered for sale. They are attended by all the principal booksellers of Germany, and by many from the adjoining countries, who adjust their accounts, learn the state of the trade in all parts of the world, and endeavour to form new connections. Most German publishers have agents in Leipzig, which is to the literature of Germany what London is to that of Great Britain. As many as five thousand new publications have been entered in a single Leipzig catalogue. The fairs ought to close in eight days, but they usually continue for about three weeks.

Italian Fairs. Of these, the most celebrated is that of Sinigaglia, on the Misa. It commences on the 20th of July, and continues for about twenty days. Here, as at the German fairs, are assembled merchants from almost all nations.

Hungarian Fairs. Of these, the most important are held at Pesth, which has become the grand centre of Hungarian commerce.

Russian Fairs. These are numerous, and many of them are well attended. The most important is held at Nishnii-Novgorod, a city situated at the confluence of the Oka with the Wolga. It is the great emporium of the internal trade of Russia. The fair generally lasts from six weeks to two months, and is well known all over the east of Europe. In point of value this fair is considered as second to none in Europe. Another celebrated Russian fair is that of Kiachta, on the Chinese frontier. At this fair by far the largest part of the commerce between the Russian and Chinese empires is transacted. The goods disposed of are principally the products of the respective countries.

Eastern Fairs. The most important fair in the eastern world is that held at Mecca, during the resort of pilgrims in the month of Dhalhajja. It has declined of late years, but the concourse which attends it is still very great. The greatest fair in India is that held at Hurdwar in Hindustan. The town, although inconsiderable, is famous for being one of the principal places of Hindu pilgrimage, which takes place along with the fair at the vernal equinox.

American Fairs. The fairs of Portobello, Vera Cruz, and Acapulco, once so famous, are now totally deserted; and that of the Havannah is also much fallen off.

FAIR ISLE, one of the Shetland Islands, lying between that group and the Orkneys, and extending fully three miles in length by about two in breadth. The coast, which is abrupt and dangerous, is only accessible on the south-east side; and the hills which cover the interior are only useful as affording pasture for sheep. The inhabitants are very few in number.

FAIRFAX, EDWARD, the able English translator of Tasso, was a native of Yorkshire, son of Sir Edward Fairfax of Denton. Little is known of his history; he is believed to have been an illegitimate son; and though liberally provided for by his father, he continued in obscure retirement at home, while the other sons of Sir Edward Fairfax were distinguished for their military services. Edward Fairfax, however, no less signally served his country by his pen than his brethren did with the sword. In the year 1600, when he is conjectured to have been little more than twenty years of age, he published his translation of the *Jerusalem Delivered* of Tasso. Never did mere translation receive such enthusiastic and continued approbation as the work of Fairfax. Waller said he was indebted to it for the harmony of his numbers; Dryden places the translator almost on a parity with Spenser (whom undoubtedly Fairfax imitated); and Collins beautifully apostrophises him as

> "Prevailing poet, whose undoubting mind
> Believed the magic wonders which he sung."

In our own day, Thomas Campbell has reckoned Fairfax's work as one of the glories of the reign of Elizabeth, while Mr Hallam, more critical, admits that if it does not represent the grace of its original, and deviates also too much from its sense, it is by no means deficient in spirit and vigour. The poetical spirit of the translation is indeed its life-blood and preservation. Hoole, Hunt, and others, may give a more literal version, but Fairfax alone seizes upon the poetical and chivalrous character of the *Jerusalem*, and carries along with him the interest and admiration of the reader. The style of Fairfax is also remarkable, and is characterized by great ease and sweetness of versification. Fairfax made no other appeal to the public. He wrote a series of *Eclogues*, one of which, the fourth, is published in Mrs Cooper's *Muses' Library*, a modern compilation; while the others remain in manuscript. He wrote also a work on *Demonology*, which is still in manuscript. This should surely see the light. It would be interesting to trace the effect of superstition on Fairfax's own mind, and to estimate its height in the age in which he lived. A fragment of the work relative to the author has been printed, and in this Fairfax describes himself in these terms:—"I am in religion neither a fantastic Puritan nor superstitious Papist; but so settled in conscience that I have the sure ground of God's word to warrant all I believe, and the commendable ordinances of our English Church to approve all I practise; in which course I live a faithful Christian and an obedient subject, and so teach my family." He appears, however, to have taken a warm interest in the religious controversies of the day, which are seldom conducive to quiet or contentment, and his descendants have not deemed it necessary to publish his prose MSS. on those subjects. His fame is secure, grafted upon the stem of Tasso, and flourishing in perennial beauty and vigour. Fairfax was living in 1631; the date of his death has not been recorded. (R. C—S.)

FAIRFAX, *Thomas Lord*, who acted so conspicuous a part during the civil wars, was the eldest son of Ferdinand Lord Fairfax, by Mary, daughter of Edmund Sheffield, Earl of Mulgrave, and was born at Denton in the parish of Otley, Yorkshire, in the month of January 1611. After studying at St John's College, Cambridge, he proceeded to Holland, where he served as a volunteer under Horatio Lord Vere. On his return to England he married a daughter of that officer. When Charles I. endeavoured to raise a guard for his own person at York, intending it, as the event afterwards proved, to form the nucleus of an army, Fairfax was employed to present a petition to his sovereign, entreating him to hearken to the voice of his parliament, and to discontinue the raising of troops; and when Charles attempted to avoid receiving it, Fairfax followed him with the petition, which he presented upon the pommel of his saddle, in Heyworth-moor, before an assemblage of nearly a hundred thousand persons. Shortly afterwards, upon the breaking out of the civil war, his father having received from the parliament a commission appointing him general-in-chief of the forces in the north, Fairfax was at the same time made general of the horse under him. In this war, both father and son distinguished themselves by their bravery, intelligence, and activity, particularly at the battle of Marston-Moor and the taking of York; Thomas Fairfax having been twice severely wounded, and having frequently exposed his life in the most daring manner. In 1645, when it was judged expedient to new-model the army, and to deprive Essex of the command, the parliament, knowing that Fairfax was a zealous Presbyterian, unanimously appointed him as successor to Essex. In this command Cromwell was joined with him in the capacity, and with the title, of lieutenant-general.

As soon as Fairfax, who was then in the north of England, received the orders of parliament, he repaired to London, where he arrived on the 18th of February 1645, and

was presented to the House of Commons on the following day by four members, and complimented by the speaker, who handed him his commission. He had full powers to name all the generals under his orders; and in the month of April he proceeded to Windsor, where he employed himself in organizing the new army which the parliament had just voted. After various movements, the hostile armies met on the 14th of June at Naseby, in Northamptonshire, and a battle took place, which ended in the total discomfiture of the royalists. The king was obliged to fly from the field, and retired into Wales. On the 16th the victorious Fairfax laid siege to Leicester, which surrendered two days afterwards. On the 10th July he offered battle to Lord Goring, who had been obliged to raise the siege of Taunton; on the 22d he carried Bridgewater by assault, and thereafter took several other places; and on the 10th September he forced Bristol to capitulate. Having reduced to subjection the whole country to the west of London, he next marched to the south; but finding it impossible, from the rigour of the season, to besiege Exeter, a well fortified city, in regular form, he converted the investment into a blockade, which lasted until the 13th of April 1646. In this interval he took several places, defeated and dispersed different bodies of royalists, and completely humbled, or rather annihilated, this party in the provinces of the south and west, which had formed its great stronghold and constituted its principal resource in England. Having obtained these successes, Fairfax marched in all haste to Oxford, where was the most considerable garrison that yet remained to the king. But the latter, afraid of being shut up in the place, and thus falling into the hands of his mortal enemies, withdrew secretly and proceeded to Newark, to throw himself into the arms of the Scotch. Oxford capitulated; and by the end of September Charles had neither army nor garrison in England.

Fairfax having arrived in London on the 12th November, was complimented and thanked for his successes by the two houses of parliament. But he had scarcely time to enjoy a little repose from the fatigues of war, when he received a commission to escort the two hundred thousand pounds granted by the English parliament to the Scotch army, in name of arrears of pay, but, in reality, according to some, as the price of the king's person, which that army had consented to give up. Charles was delivered up to the commissioners of parliament on the 30th January 1646. Fairfax, who preceded the king, having met him beyond Nottingham, dismounted from his horse, kissed the royal hand, and having resumed his seat, discoursed with the unfortunate prince during the journey to Holdenby. That Charles was satisfied with the conduct of Fairfax, appears from the observation which he addressed to one of the parliamentary commissioners. "The general," said he, "is a man of honour, and keeps his word which he had pledged to me. Fairfax was received at Cambridge with the greatest honours, and created master of arts. By this time the parliament, after long debates, had appointed him general of the forces, which were still to be kept on an effective footing; for it was now intended to disband the greater part, and send the remainder to Ireland. But the soldiers being extremely dissatisfied with a project which threatened to deprive them of all the advantages they had reaped from the war, Cromwell, who had hitherto allowed Fairfax to enjoy in appearance the honours of supreme command, resolved, in concert with Ireton, his son-in-law, to profit by this disposition of the army, in order to foment a revolt against the parliament. Fairfax observed with regret that these agitators, as they called themselves, had usurped the power which he should have exercised over the army; he discerned that they were the forerunners of anarchy, and that their design was to raise their own fortune on the ruin of the state. He therefore resolved to resign his commission; but the chiefs of the Independents, whose projects were not fully matured, persuaded him to retain it. He then, with culpable weakness, co-operated in all the proceedings of the army, which had for their object to destroy the power of the parliament. In vain did the two houses enjoin him to leave his troops at the distance of at least 15 miles from London; he entered that city in triumph, with the speaker and sixty members of the House of Commons, who, betraying the privileges of parliament, had retired to the camp, and whom he now re-instated in their places. Having soon afterwards learned that the king had been removed by violence from Holdenby, Fairfax, indignant at this proceeding, repaired to the place where this unfortunate prince was detained near Cambridge, conducted himself towards the royal captive in the most respectful manner, and caused him to follow all the movements of the army, in order that the parliament might not obtain possession of his person, for which purpose commissioners had already been named by both houses. The credit of Fairfax with the troops, however, diminished daily; he had neither firmness of will nor force of character sufficient to oppose himself to a power which had long overtopped his own; and although he had in view none of the objects which Cromwell cherished, he contributed to render them all successful. It was doubtless in consequence of this inconceivable weakness that he concurred in the manifesto of the army, published in the month of January 1648, which adhered to the vote of the commons, that no more addresses or messages should be presented to the king, and protested that it would obey parliament in everything which might henceforth be necessary for the government of the kingdom and the safety of parliament, whether with the king or against him.

At this period (1647), Fairfax lost his father, whom he succeeded in his titles and employments; but still he remained, as before, the instrument of the ambition of Cromwell. He displayed the greatest activity in putting down insurrections, and took Colchester, whither the remains of the royalist party had betaken themselves. He caused Lord Lisle and Sir Charles Lucas, who had defended Colchester, to be executed—an act of harsh severity, if not contrary to the terms of capitulation. At the end of the year he returned to London, in order to keep in check that city and the parliament; and he took up his head-quarters in the palace of Whitehall. All his proceedings served to accelerate the crisis of the king's fate; but although placed at the head of the judges before whom Charles was to be tried, he refused to act, probably at the instigation of his wife, who on this occasion displayed great boldness and intrepidity. He even exerted himself to prevent the execution of the sentence, and tried to persuade his regiment to rescue the king from the hands of those who had condemned him to death. But Cromwell and Ireton, ably assisted by Harrison, imposed on the pious credulity of Fairfax; and kept him at a distance from Whitehall engaged in religious exercises, until the fatal blow was struck. A few days after the execution of Charles, he was appointed a member of the council, but refused to sign the form of oath by which all that had been done relative to the king and to the royal authority was approved of. Towards the end of March he received the title of general of the troops in England and in Ireland; but he no longer possessed any real power. He marched against the Levellers, who having become numerous, had occasioned considerable uneasiness and would soon have rendered themselves formidable, and completely routed them at Burford in Oxfordshire. He then repaired to Oxford, where he received the degree of doctor of laws; after which he proceeded to allay the troubles in Hampshire, assembled the army in Guildford, exhorted it to obedience, and returned to London, where he was presented with a basin and ewer of beaten gold. In June 1650, when the Scotch had declared for Charles II., the council of state

in England having resolved to send an army to Scotland, in order to prevent an invasion, Fairfax was consulted respecting the design, which he appeared at first to approve; but afterwards declared himself satisfied that the parliament of England had no just ground for sending an army to invade Scotland; and, in terms of this declaration, he resigned his commission. The supreme command of the army was then conferred upon Cromwell, who saw with pleasure the retirement of a man who, being no longer necessary to his ambitious projects, now formed an obstacle to their entire accomplishment. The parliament, however, in some measure indemnified Fairfax, by granting him a pension of five thousand pounds sterling.

Being thus released from all public employment, Fairfax retired to Nunappleton, Yorkshire, where he passed his time in tranquillity, earnestly praying, it is said, for the restoration of the royal family. When General Monk invited him to assist in the operations about to be undertaken against Lambert's army, he promptly obeyed the call, and on the 3d December 1659 appeared at the head of a body of Yorkshire gentlemen; and such was the influence of his name and reputation, that the Irish brigade, consisting of twelve hundred horse, quitted Lambert's colours and joined him; an event which was speedily followed by the breaking up of all Lambert's forces. On the 1st January 1660 he made himself master of York; and on the 2d he was chosen by the Rump Parliament one of the council of state, an appointment which was renewed on the 23d of February ensuing. On the 29th of March he was elected one of the knights of the county of York in the healing parliament; and he was put at the head of the commission appointed by the House of Commons on the 3d of May, to wait upon Charles II. at the Hague and urge his speedy return. After the dissolution of the healing parliament, which was of short duration, he again retired to his seat in the country, where he lived in a manner strictly private till his death, which happened on the 12th of November 1671, in the sixtieth year of his age. The integrity of Fairfax has never been doubted. He was a brave and honest soldier, but great only in the field. He had none of the qualities of a statesman, and though praised by Milton for "firm unshaken virtue," he was in reality deficient in moral courage and consistency. He seems to have oscillated between the counsels of his wife, "one of the fighting Veres and given to Presbyterianism," as Mr Carlyle says, and the influence of Cromwell, whose strong decisive character was a contrast to that of Fairfax his general-in-chief. Lord Fairfax had a taste for literature, and both at York and Oxford endeavoured to save the libraries from pillage. He enriched the Bodleian library with some valuable MSS. He wrote some poetical and miscellaneous pieces, including a sketch of his own life. His correspondence was published in 1848-49. (R. C—S.)

FAIRFORD, a market-town of Gloucestershire, on the small river Colne, 23 miles E.S.E. of Gloucester, and 79 miles from London. It is noted for its parish church, a fine Gothic edifice erected about 1470, and having a remarkably fine series of painted windows. Pop. of parish (1851) 1859.

FAIRIES, imaginary beings of both sexes and human shape, who are fabled to frequent the haunts of men, to dance in meadows, and to be distinguished by a variety of fantastical actions, either innocent or mischievous. In traditions and romances they are frequently represented as beings of diminutive stature and exquisite beauty: and sometimes as women of an order superior to human nature, yet subject to wants, passions, accidents, and even death; sprightly and benevolent whilst young and handsome; morose, peevish, and malignant if ugly or in the decline of their beauty; generally robed in green, but fond also of appearing in white; from which circumstance they were sometimes called the White Ladies.

Concerning these imaginary beings, Jervaise of Tilleberry, marshal of the kingdom of Arles, who lived in the beginning of the thirteenth century, thus writes:—"It has been asserted by persons of unexceptionable credit, that fairies used to select lovers from among men, and rewarded their attachment with an affluence of worldly goods; but if they deserted them or revealed the connection, they smarted severely for such indiscretion." Similar tales were current in Languedoc; and throughout the province there was not a village without some ancient seat or cavern which had the honour of being a fairy's residence, or at least some spring in which a fairy used to lave its tiny form. This idea of fairies has a near affinity with that of the Greeks and Romans concerning the nymphs of the woods, mountains, and springs; and an ancient scholiast on Theocritus says, that "the nymphs are demons (spirits) which appear on the mountains in the figure of women." The Arabs and other orientals have also their *Peris*, of whom they entertain notions somewhat similar to those held in the west respecting fairies.

Fairies have usually been described as of small stature, though capable of assuming various forms and dimensions. It is scarcely necessary to add that the most charming representation of these children of romantic fancy is to be found in the *Midsummer Night's Dream*. For an elaborate account of fairies in general, see Keightley's *Fairy Mythology*, 2 vols. 8vo, in which the legends of different countries are collected.

Fairy of the Mine, an imaginary being, fabled to inhabit mines; wandering about the drifts and chambers, always employed in cutting ore, turning the windlass, &c., but effecting nothing. The Germans believed in two species; one fierce and malevolent, the other harmless. Such is the relation of Agricola, in his book *De Animantibus Subterraneis*.

Fairy Circle or Ring, a phenomenon pretty frequent in the fields, and supposed by the peasantry to have been traced by the fairies in their dances. There are two kinds of fairy ring: one of about seven yards in diameter, containing a round bare path, about a foot broad, with green grass in the middle of it; and another of different dimensions, encompassed with a circumference of grass. The formation of these rings was formerly ascribed to the action of lightning; and some have attributed them to the labours of ants; but Mr Cavallo, in his *Treatise on Electricity*, points to their true origin when he says—"They seem to be rather beds of mushrooms than the effects of lightning." These rings are seldom of a perfect form, and frequently spread with great irregularity, forming, as it were, a series of arcs of circles. This irregularity is occasioned by the peculiar mode of growth of the fungi by which they are produced. In the words of Dr Carpenter (*Principles of Physiology*), "The masses of fungous vegetation which form the progressively extending fairy rings or magic circles of the grassy meadow may be said to be several years of age, although, as fast as new tissue is generated on the exterior of the ring, that of the central side dies and decays, so that no individual part has more than a brief duration."

FAITH, that assent which we give to a proposition advanced by another, the truth of which we do not immediately perceive from our own reason or experience; or it is a judgment or assent of the mind, the motive of which is not so much any intrinsic evidence, as the authority or testimony of some other who reveals or relates it.

Faith, in *Theology*, denotes the assent of the mind or understanding to the truth of what God has revealed; or such a conviction of his being, perfections, character, and government, as produces love, trust, worship, obedience, and resignation. Faith in Christ, as it has been defined by some theologians, is a mere assent to the gospel as true; but according to others, it signifies such a persuasion that he is the Messiah, and such a desire and expectation of the

blessings which he has promised in his gospel to his sincere disciples, as engage the mind to fix its dependence upon him, and to subject itself to him in holy obedience. Faith likewise, in respect of futurity, is a moral principle, implying such a conviction of the reality and importance of a future state, as is sufficient to regulate the temper and conduct in the affairs of this life.

FAKENHAM-LANCASTER, a market-town and parish of England, county of Norfolk, on the banks of the Wensum, 24 miles N.W. of Norwich, and 109 miles from London. It formerly possessed a considerable trade in hand-made woollen goods, which, however, has gradually disappeared since the application of machinery to the manufacture of worsteds. The parish church is a very handsome edifice. The surrounding country is remarkable for its fertility, especially in wheat. Market-day, Thursday. Pop. of parish (1851) 2240.

FAKIR, an Arabic word, signifying "poor," which is employed to denote a kind of religious mendicant very common in India. In this sense it is synonymous with the Persian and Turkish dervise. A certain class of these mendicants live in communities like the monks of the Western world, while others live singly as hermits, or wander about making strange displays of self-torture and mortification. Although from time immemorial asceticism has been held in high veneration in the East, and it was deemed meritorious to retire from the world, to renounce the comforts of the domestic and social relations, and to live in poverty, solitude, and religious contemplation, the original principles of Mohammedanism were unfavourable to a monastic life. Religious mendicants did not appear among the Mussulmans till six centuries after Mohammed, in the thirteenth century of the Christian era. But there is reason to believe that they existed among the Hindus at a much earlier period. From the first they appear to have been distinguished by their ragged and filthy dress, and the severity of their self-inflicted penances. A celebrated member of their order, who flourished about the close of the twelfth century, says that the exterior of those devoted to a religious life should be a ragged dress and ill-combed hair; and a later writer affirms that a member of this mendicant order should have ten of the qualities proper to the dog,—to be always hungry—to have no fixed residence—to watch during the night—to leave no heritage after his death—not to abandon his master although ill treated by him—to content himself with the lowest place, and to yield his seat to any one who wants it—to return to the person who has beaten him when offered a morsel of bread—to keep at a distance when one is bringing him something to eat—and not to think of returning to the place he has quitted while following his master. Jâmi, the well-known Persian poet, in the introduction to his work on the lives of the Sûfis or Mohammedan mystics, divides those who seek the future into three classes,—the Zâhids, who, full of faith, look down with contempt upon the life on earth, which they consider as imperfect and miserable; the Fakirs, who renounce the world in the belief that their minds will by poverty be rendered fitter for the exercise of virtue, and that they will hereafter be recompensed for present privations; and the Abids, who hope to merit future reward by entirely devoting themselves to religious exercises. Among the Turks several orders of fakirs or dervishes exist. The chief of these is the order of the Maulavîs, founded about the close of the thirteenth century by the Persian poet Jelâleddin Rûmi. They have a great monastery at Galata and another at Iconium, and have also convents in nearly all Mohammedan countries. Mendicants of this order are notorious for their fondness of intoxicating liquors and of opium, and are addicted to the practice of sorcery, conjurations, and tricks of legerdemain. They may leave their order, and are then released from their vows of celibacy, and are permitted to marry. The order of the Rufûis are celebrated for their strange excesses of self-mortification. In their weekly meetings some of their number are always selected to hold a red-hot piece of iron between their teeth till it becomes cold, while the others make deep incisions in their bodies with sharp-edged instruments. A third class, termed the Calenders, are distinguished by the singularity of their dress. They sometimes wear a tiger's or a sheep's skin, sometimes garments made of party-coloured clothes, and not unfrequently go about half naked with their skin painted red or black, feathers in their ears, fancifully-shaped turbans or hats on their heads, a stick or a hatchet, or sometimes a drawn sword, in their hands, and in their girdles a plate or bowl, which they hold out to receive alms. In this guise they visit coffee-houses and other places of public resort to preach and to beg.

The Hindu fakirs go entirely naked, carrying on their shoulders a thick club, the end of which is wound round with rags of cloth of all colours. They strew their hair, which hangs half way down their back, with ashes, with which they sometimes besmear their whole bodies. Stavorinus says they generally take up their abode in shady places, either in the open air or in old and ruinous buildings, without using anything to repose on or to cover themselves. All classes of these mendicants endeavour to gain the veneration of the people by the infliction of absurd and cruel penances and tortures. Stavorinus says he met with some who, by holding an arm raised in one position for many years, had lost the power of lowering it again. Others had bent their bodies forward till they had grown so crooked that they formed a right angle. Some, by continually bending the head backward, could not bring it back to its natural position. Others keep the hands clasped together so long, that the nails grow into the flesh, and come out on the other side. Tavernier mentions that some of these fakirs never sit or lie down to sleep, but are supported by a rope hung down for that purpose. Others lay fire on their heads, and burn their scalps to the very bone. Others roll themselves naked on thorns. Some bury themselves in a pit or ditch for nine or ten days, without tasting food or drink. A recent traveller in India states that he saw a fakir who was never "known" to eat at all. He carried a small black stone about with him, which had been presented to his mother by a holy man. He pretended that by sucking this stone, and without the aid of any sort of nutriment, he had arrived at the mature age of forty in a state of obesity which did great credit to the fattening powers of the black stone. Oddly enough, his business was to solicit offerings of rice, milk, fish, and ghee, for the benefit of his patron, Devi. These offerings were nightly laid upon the altar before Devi, who was supposed to absorb them during the night, considerately leaving the fragments to be distributed among the poor of the parish. Sometimes, this writer adds, a fakir will take it into his head to trundle himself along like a cart wheel for a couple of hundred miles or so. He ties his wrists to his ankles; gets a *tire*, composed of chopped straw, mud, and cowdung, laid along the ridge of his backbone; a bamboo staff passed through the angle formed by his knees and elbows by way of axle, and off he goes; a brazen cup, with a bag, and a *hubble-bubble* hang like tassels at the two extremities of the axle. Thus accoutred, he often starts on a journey which will occupy him for several years. On arriving in the vicinity of a village, the whole population turn out to meet and escort him with due honours to the public well or tank, where he unbends and washes off the dust and dirt acquired by perambulating several miles of dusty road. After ascertaining, by minute inquiries, the state of the larders of the assembled villagers, he takes up his quarters with the man who is best able to entertain him. When the supplies begin to fail he ties his hands to his heels again, gets a fresh tire put on, and is escorted out of the village with the same formalities as accompanied his entrance.

Some of these mendicants are undoubtedly insane, but the greater part of them are impostors and hypocrites, who secretly indulge in the grossest licentiousness while they assume a sanctimonious air in order to obtain a pretext for idleness and for preying on the ignorant and superstitious natives. D'Herbelot estimated that there were 800,000 Mohammedan, and 1,200,000 Hindu, fakirs in India.

(D'Herbelot's *Bibliothèque Orientale;* Tavernier's *Travels;* Stavorinus' *Voyage to the East Indies; Household Words*, vol. iii., p. 310.) (J. T—R.)

FALAISE, a town of France, capital of a cognominal arrondissement in the department of Calvados, and situated on the right bank of the Ante, 21 miles S. by E. of Caen. Pop. (1851) 8700. It was formerly a place of some strength, and is still surrounded by old walls. The principal object of interest is the castle, now partly in ruins, but formerly the seat of the dukes of Normandy, and the birthplace of William the Conqueror. Falaise has two large and populous suburbs, one of which, Guibray, now rivals in size and importance the town itself, and is celebrated for its annual fair, which lasts from 10th to 25th August. The town contains a town-hall, hospital, theatre, several churches, and a public library. The manufactures are cotton goods, hosiery, leather, paper, &c.

FALASHA, a people of Abyssinia, described by Bruce, and supposed to be of Hebrew origin. According to their own tradition, they are descendants of Jews who came into Ethiopia as attendants of Menilek, the son of the queen of Sheba or Saba by Solomon. See ABYSSINIA.

FALCATED, in the form of a sickle: used more particularly of the moon when she appears in the form of a crescent or sickle.

FALCON (*Falco*), a name bestowed on several birds of prey, but chiefly on such as are trained to sport, as in hawking. See *Falconidæ* and *Falco* in index to ORNITHOLOGY.

FALCONER, WILLIAM, our greatest naval poet. Till now great uncertainty has prevailed in regard to the date of his birth, but in the parish records of the City of Edinburgh we find the following entry:—"11*th February* 1732.—William Falconer, wigmaker, and Agnes Shand had a son born named William." His father, a barber in the Netherbow, was unsuccessful in life, became bankrupt, and had two children besides the poet, both of whom were deaf and dumb. The old man, in his latter days, kept a small grocer's shop, but died in extreme poverty. The "young Arion" of the family was thus early inured to penury and distress. He received the scanty education required to qualify him for an inferior employment, and at an early age he was entered as an apprentice on board a merchant-vessel belonging to Leith. He afterwards served as a common sailor on board the ship of which Campbell, author of *Lexiphanes*, was purser, and attracted the notice of Mr Campbell by indications of talent. How long he continued in this humble capacity is not known; but by some friendly intervention he was appointed second mate of a vessel called the Britannia, employed in the Levant trade, which, however, was wrecked near Cape Colonna during her passage from Alexandria to Venice, and only three of the crew, including Falconer, were saved. This event suggested the idea of his poem, *The Shipwreck*, on which his reputation rests. But if Clarke be right in the opinion that he was the author of the fine naval song "Cease, rude Boreas," an exception must be made in favour of that popular lyric. Falconer continued in the merchant service until the spring of 1762, when he recommended himself to the notice of Edmund Duke of York, by the dedication of *The Shipwreck*, and enlisted his royal highness amongst the number of his admirers and patrons. Desirous to place him in a situation where he could be befriended, the duke advised him to enter the navy; and before the end of summer he was rated as midshipman on board the Royal George. But as this ship was paid off at the peace of 1763, and as Falconer's period of service had been far too short to enable him to obtain the commission of lieutenant, he was advised to exchange the military for the civil department of the navy; and, in the course of the same year, he received an appointment as purser of the Glory frigate, a situation which he held until that vessel was laid up in ordinary at Chatham. In 1764 he published a new edition of *The Shipwreck*, in 8vo, corrected and enlarged, most of the descriptive and episodical matter being introduced; and the following year appeared *The Demagogue*, a political satire, intended as a sort of antidote to the writings of Wilkes and Churchill, but much more remarkable for virulence than wit. His time, however, was chiefly occupied with the compilation of an *Universal Marine Dictionary*, a work much wanted, and which, when brought out in 1769, was received with general approbation. Before this period he appears to have left his retreat at Chatham for the metropolis; and Mr Murray, a bookseller, father of Byron's publisher and friend, wished him to join him in business. Falconer however declined, having received an appointment to the pursership of the Aurora frigate, which had been commissioned to carry out to India Messieurs Vansittart, Scroften, and Forde, as supervisors of the Company's affairs; and he was also promised the office of private secretary to these functionaries. The Aurora sailed from England on the 30th September 1769, and after touching at the Cape of Good Hope was never more heard of; she was supposed to have foundered in the Mozambique Channel.

Besides the productions already mentioned, Falconer was the author of several pieces, the most considerable of which are an Ode on the Duke of York's second departure from England as rear-admiral, and a Poem on the death of Frederick, Prince of Wales. His fame as a poet must, however, rest on *The Shipwreck*. There is a warmth in its colouring, and a reality in its descriptions, which, notwithstanding the didactic character of the poem, sustain its interest. Natural feeling, imagery, and truth are expressed in language which, if it never rises to a great elevation, seldom sinks below the dignity of the subject. Falconer does not aspire to produce a great effect by a few bold touches, or the rapid and masterly grouping of appalling or horrible circumstances. He labours in detail, bringing before us, without apparent effort, the events as they arise, and conducting us with an interest constantly increasing towards the catastrophe. He paints with minute fidelity as well as picturesque effect; but it is from the general result, rather than from any portion of the work considered separately, that the talents of the artist should be judged. Such a tremendous picture of shipwreck as that which Byron has, in wild sportiveness, thrown out in Don Juan, immeasurably transcends the powers of Falconer, and indeed stands alone in its terrible sublimity; but, on the other hand, the naval poet, by the careful elaboration of natural circumstances, and the general truth of his delineation, ultimately impresses the mind of the reader, if not with such vivid force, perhaps with even more enduring effect. Some of the classic invocations to the shores of Greece, and some descriptive passages, are a little tawdry, but the grand incidents of the poem dwell strongly on the recollection, and its impression is never forgotten. Nor are the technical expressions and directions a drawback to the general reader. They are explained in foot-notes, and give a truth and reality to the narrative; and they do not occur in the more impassioned scenes. (R. C—S.)

FALCONRY. See HAWKING.

FALERII (now *Santa Maria di Falleri*), in *Ancient Geography*, an ancient and powerful city of Etruria, believed to have been of Pelasgic origin; but in historic times it appears as an Etrurian city, and probably belonged to the Etrurian Confederation. Falerii was at first de-

cidedly hostile to the Roman name, and supported the Veientes in their war with that people, using their utmost efforts at the same time to rouse the other Etrurians to join them against the common foe. After the reduction of Veii the Faliscans saw themselves exposed to the full fury of the Roman arms; and after enduring a siege from Camillus, were obliged to surrender their capital into his hands. The interesting episode of the traitor schoolmaster and the generosity of the Roman commander need only be hinted at to be generally remembered. From this time Falerii continued, sometimes at peace, sometimes at war, with Rome, till at the close of the first Punic war it rose in open rebellion; but after a short resistance it was taken and destroyed, and the inhabitants were forced to select a site for a new town in a less inaccessible position than the old city had occupied. In the middle ages, however, the inhabitants, invited by the impregnable position of the old site, returned to it and built the town now known as Civita Castellana. The ruins of the second or Roman Falerii are now occupied by the small hamlet of Sta Maria di Falleri.

FALERNUS AGER, a district in the northern part of Campania, celebrated for its wine, which in the time of Horace was reputed the best of all the Italian wines. It included the country extending from the Massic Hills to the river Vulturnus; and when it passed into the hands of the Romans in 340 B.C., formed part of the Capuan territory. The Falernian wine so famous in the times of Horace had began to degenerate before those of Pliny, in consequence of careless cultivation; and were supplanted in general estimation by those produced in the adjoining Ager Statanus.

FALKIRK, a municipal and parliamentary burgh and market-town of Scotland, county of Stirling, beautifully situated on the face of an eminence which overlooks the wide expanse of fertile country called the Carse of Falkirk. The town consists of one wide street, with a number of narrow streets and lanes branching off from or running parallel to it. The houses are generally lofty and well built. The parish church, erected in 1811, has a fine steeple 130 feet high. There are also places of worship for the Free Church, United Presbyterians, Independents, and Roman Catholics. There is also a flourishing school of arts in which lectures on scientific subjects are delivered every winter. Continuous lines of houses connect Falkirk with the villages of Grahamston and Bainsford, and extend thence to Carron, which lies about 2 miles N. of the town, and is celebrated for its iron-works. Though Falkirk is not itself a manufacturing town, having only some tanneries, breweries, and a small manufactory of pyroligneous acid, yet the neighbourhood teems with extensive works of various kinds. In addition to the Carron iron-works there is the Falkirk foundry at Bainsford, employing about 500 persons; besides several extensive collieries, distilleries, flour-mills, &c. The three trysts or cattle fairs held here annually, on the 2d Tuesday of August, and the 2d Monday of September and October, are the largest in Scotland; the last being by far the largest of the three. Each continues for at least two days, and sometimes for nearly a week. Falkirk is a town of considerable antiquity, and appears to have been a place of some note in the early part of the eleventh century. Its original name was Eglishbreckk, which signifies the "speckled church," in allusion it is supposed to the colour of the stones, and translated by Buchanan *varium sacellum*. The old church demolished in 1810, and whose site is occupied by the modern edifice, was erected in 1057, the year in which Malcolm Ceanmore assumed the sovereignty. In the valley between Falkirk and the Carron a battle was fought between the Scotch under Sir William Wallace and the English under Edward I., in which the former were defeated, and two of their chieftains, Sir John Graham and Sir John Cumming, slain. Their graves are still pointed out in the churchyard: that of Graham has a monument with an inscription which has been several times renewed. On a moor a little to the S.W. of the town a battle was fought on 17th January 1746, between the royal forces and those of the Pretender, in which the rebels were victorious. On this occasion fell Sir Robert Monro of Foulis, and his brother Dr Monro, whose monument is to be seen in the churchyard. In the vicinity traces of the Roman wall are still visible. Falkirk was formerly a burgh of barony, but was created a royal parliamentary burgh by the Reform Act, and is now governed by a provost, 3 bailies, a treasurer, and 7 councillors. It unites with Airdrie, Lanark, Hamilton, and Linlithgow, in returning a member to parliament. Pop. (1851) 8752. It is 24 miles W.N.W. of Edinburgh, on the Edinburgh and Glasgow, and the Scottish Central railways.

FALKLAND, a royal burgh of Scotland, county of Fife, at the N. foot of the East Lomond Hill, 22 miles N.N.W. of Edinburgh. Pop. (1851) 1330. It consists of a single street with some cross lanes; the houses being in many cases thatched and of an antique and primitive appearance. Falkland is a place of little or no traffic, and the inhabitants are mostly engaged in weaving. It is chiefly noted for its royal palace, originally a stronghold of the Macduffs, earls of Fife, but forfeited to the crown in 1424 on the attainder of Mordac Stewart the 17th earl. It was greatly enlarged and improved by James V., who died here in 1542; and was also the favourite residence of James VI., on account of the fine park and abundance of deer. The east side was accidentally burnt in the reign of Charles II., and the park ruined during the time of Cromwell, when the fine oaks were cut down in order to build a fort at Perth. In 1715 the famous Rob Roy garrisoned the palace and laid the burgh and vicinity under contribution. The palace till recently was allowed to fall into decay, but what remained of it has been renovated and fitted up, and now forms the residence of O. T. Bruce, Esq., the heritable keeper. Falkland was constituted a royal burgh by James II. in 1458, and its charter was renewed by James VI. in 1595.

FALKLAND ISLANDS (French *Malouines*, Spanish *Malvinas*), a group of islands in the South Atlantic Ocean, belonging to Britain, and lying about 250 miles E. of the nearest mainland of South America, between 51. and 53. S. Lat., and 57. and 62. W. Long., or in precisely the same latitudes south as London and the midland counties are north. The group consists of two principal islands, East and West Falkland, with several hundred others of different sizes clustered around and in the strait between them. East Falkland is about 85 miles in length by 40 in breadth, and West Falkland 80 miles long by 25 to 30 miles wide. They are separated from each other by Falkland Sound. The other islands range in size from 16 miles by 8, to mere islets of half a mile across. The whole group is deeply indented by numerous harbours and creeks, which, if they diminish the area, produce more than counterbalancing advantages. Very little is known of West Falkland. It is uninhabited, but at certain seasons is visited by whaling and other vessels. East Falkland is nearly divided into two unequal portions by the estuaries called Breton Sound and Choiseul Sound, the two parts of the island being connected by an isthmus not more than a mile and a half across. The northern portion is crossed by a chain of rugged hills, called the Wickham Heights, extending due E. and W., from Port William to Port Sussex, and varying in height from 800 to 2000 feet. This range consists chiefly of quartz rock, which crops out with great irregularity, so that it can be crossed only at certain passes. South of this range it is one continued undulating plain, few of the heights rising to more than 60 feet above the level of the sea, and the ridges running nearly N.W. and S.E. Through every little valley a stream of fresh water flows into one or other of the numerous creeks and inlets of the sea. Besides these rivulets, there are numerous

fresh-water ponds or lakes, varying from 30 yards to 3 or 4 miles in circumference. North of the Wickham Heights the surface is hilly, some of its elevations rising to the height of upwards of 1000 feet. The side of the heights contains slate, some of which is suitable for building and roofing purposes; and limestone has been discovered on and about the foot of Mount Usborne. From certain parts of these upper regions there descend into the valleys *streams of stones*, from 20 or 30 feet to a quarter of a mile wide, and below these stones there usually flows a stream of water. These stones are frequently of considerable size, and have not moved far, as their angles are generally but little broken. The climate is said to be very mild and salubrious. The temperature is more equable than that of England, being rarely so hot in summer or so cold in winter. The ice is seldom more than half an inch thick, except in very severe winters, and snow lies but a short time on the ground. Light showers are frequent, but a day of heavy rain never occurs. Excessive winds are common, but thunder-storms are extremely rare. The hottest months in the year are December and January. The soil is of a deep brown, almost black, compact, peaty quality, lying upon a strong clay subsoil, and from 6 inches to 2 feet deep. North of the Wickham Heights the soil is lighter, more peaty, rank, and on an inferior subsoil (a red gravelly clay), and in the neighbourhood of the quartz rock formations, on a stiff dirty-white clay.

There are few wild animals indigenous to the Falklands. The only quadruped is the warrah or wolf-fox (*Canis Magellanicus*), rather taller, but not much heavier, than our fox. The other animals which are found in a wild state are those which have been left there by Europeans, as horned cattle, horses, sheep, wild hogs, and rabbits, all of which are very abundant. There is a plentiful supply of excellent fish in all the creeks, and of small trout in the lakes and rivulets. Hair and fur seals abound, and the black whale is still numerous about these coasts. The wild fowl are also numerous, as swans, geese, ducks, snipes, &c. There are few land birds or insects, and no reptiles.

A gigantic sedgy grass, called tussac, of the genus Carex, is very common on most of these islands. Its blade averages seven feet in length by about three-quarters of an inch in width, is extremely nutritious, and admirably adapted for fattening cattle. Turnips, carrots, potatoes, and vegetables thrive well, and barley and oats have been successfully cultivated. Furze and other shrubs grow well, but there are as yet no trees. Peat is abundant, and some of it is highly bituminous. Coal has been discovered, but whether it can be profitably worked has not yet been ascertained.

The discovery of these islands has been by many attributed to Amerigo Vespucci, in 1502; but it is more probable that they were first discovered by Davis in 1592. In 1594 Hawkins sailed along their north shore; and in 1690 Strong sailed through the channel which separates East from West Falkland, and called it Falkland Sound, whence the group afterwards took its name. During the earlier parts of the eighteenth century these islands were frequently visited by French vessels; and in 1764 a French colony was established at St Louis, on East Falkland. Two years later the English planted a colony at Port Egmonton, West Falkland. In 1767 the Spaniards took possession of the French settlement, and three years later of the English. In consequence of this step, some negotiations were entered into, the result of which was that the sovereignty of these islands was ceded to the English, who, however, some time afterwards abandoned them. Though frequently visited by whaling vessels and others, they continued without permanent inhabitants till 1820, when they were taken possession of by the republic of Buenos Ayres. A settlement was formed at Port Louis, which rapidly increased until 1831, when, in consequence of a dispute with the United States, it was destroyed by the Americans. In 1833 the English again assumed possession of the Falklands, and stationed an officer and boat's crew at Port Louis. In 1840 the government resolved to colonize these islands, and sent out for that purpose a governor and a small establishment, who settled at Port Louis. A more advantageous situation for a settlement was subsequently found on the south side of Stanley Harbour, where, in 1844, a town was laid out. Mr Lafone, a wealthy merchant, obtained from government an extensive tract of land, and possession of all the wild cattle and other wild stock for six years, from 1st January 1848, in consideration of a payment by instalments of L.60,000. Mr Lafone's interests have recently been purchased by a chartered company, which now possesses, in East Falkland, all the southern peninsula called Lafonia, consisting of about 600,000 acres besides 138 islands and islets, with an aggregate area of about 200,000 acres, until January 1856. The company possesses absolute right to all the wild cattle or other wild stock which may be found upon any of the islands, but after that period this right ceases except as to stock, &c., then in actual possession of the company. In 1847 the population of the colony was 270. The governor of these islands, in January 1853, reports the colony to be steadily progressing. In 1851, the number of tons of shipping that entered the port of Stanley was 17,538, and in 1852 it was 22,024, being an increase of 4,486 tons. This necessarily produces a demand for produce and labour. Unskilled labourers earn from 3s. to 5s. a day, and skilled from 6s. to 10s. Provisions are abundant, and at reasonable prices. "The transference to the Falkland Islands Company of the large interests held by Mr Lafone, and the commencement by that corporation of a more comprehensive system of operation, supported by a large capital, gives me very favourable hopes of benefit to the colony, and, I trust, to the shareholders." (*Report.*) In 1849, twelve allotments of one acre each, near the town, were put up for sale, and were sold on an average at L.6 per acre; and eleven similar allotments, sold in 1852, brought on an average L.12 per acre, or six times the usual government price. "The master of a barque, the Record, lately in the harbour, publicly notified that he would take passengers to the gold diggings in Australia at L.10 per head, and it gives me much pleasure to add that not a person could be found in the colony to accept his proposition." (*Report.*) Being chiefly dependent upon the ships that call here to refit or for refreshments, the opening of a ship canal between the Atlantic and Pacific Oceans would affect this settlement very much, and might probably lead to its abandonment.

FALL, the name given in Scotland to a measure both of length and superficies. As a measure of length, the fall is equal to six Scots ells, or 6·1764 English yards; and as a measure of superficies, to 36 square ells.

FALL OF MAN, in sacred history, that memorable event by which man lost those perfections bestowed on him by his Maker at his creation. See THEOLOGY.

FALL RIVER, a town of the United States, Massachusetts, 46 miles S. of Boston, situated on the Fall River, at its junction with the Taunton, which last falls into Mount Hope Bay, a branch of Narraganset Bay. The harbour on Taunton river is safe and easy of access, and has depth of water sufficient for the largest ships. Fall River has a large coasting trade, and is engaged in the whale and other fisheries. It has extensive cotton and woollen factories, bleaching works, foundries, &c., and communicates regularly with New York by steamers, and with Boston by railway. Pop. (1850) 11,522.

FALLACY is a logical term; but in the consideration of the ideas denoted by it, we are led, at several points, beyond the ground occupied by Logic Proper. Especially there is often involved, in the scrutiny of fallacies, examina-

tion of the matter of arguments, that is, of the nature of the objects argued about. The chapters on fallacies, therefore, which appear as appendices in the most elaborate logical treatises, really travel more or less out of the proper domain of the science; and the topic may here deserve a few paragraphs of separate illustration.

A Fallacy is an unsound or inconclusive argument; an argument supposed or alleged to prove a conclusion which it does not prove. The name is sometimes confined to sophisms, that is, unsound arguments used with the intention to deceive. But the intention is a point of secondary importance in the theory of fallacies; and, indeed, those fallacies in which the reasoner deceives himself are by far more dangerous than the others, because they are by far more common. The term Fallacy, it will thus be observed, is applicable to an argument taken as a whole, not to any of the propositions of which the argument is composed. The propositions severally must be true or false: the argument which they constitute must be correct or fallacious; that is, its conclusion must either follow or not follow from the premises.

In demonstrative reasoning, such as that whose matter is mathematical truth, there is but slight occasion for a systematic consideration of fallacies. The ideas which arguments of this sort deal with are both few and simple; and the words in which the ideas are expressed have precise and well-fixed meanings. But in probable reasoning, the matter of which comprehends all questions directly regarding human character, and conduct, and destiny, the ideas are many and complex, and the language is seldom either precise or exactly defined. In testing such an argument, therefore, we have to begin by subjecting it to something like an anatomical dissection. We aim at exhibiting the bare skeleton of the argument, that we may be able to perceive whether its parts are or are not firmly knit together.

The process by which we gain such a view of an argument is twofold. There is required, on the one hand, a stripping off of everything inessential. Into every argument in probable matter, much that is inessential finds its way even in thought; and still more that is inessential intrudes into the argument when it passes into words. It is required, on the other hand, to bring distinctly into view all the points of junction—all the points at which one part of the argument is related to another. In the form which argumentation naturally and usually assumes, all those points are not exposed. We have, and we continually indulge, a tendency to argue elliptically, to omit steps of our reasoning; and, omitting largely in thought, we omit still more largely in expression. The honest thinker passes over hastily in his own mind, and denotes but briefly, if at all, in words, those steps as to which he himself has no doubt, and which he believes to be equally clear to others: the sophistical debater slurs over, or keeps back altogether, if it be possible, those steps in which he knows the weakness of his argument to lie.

In a word, paradoxical though the assertion may appear, it is found, when we aim at testing our ordinary acts of reasoning in probable matter, that they are irregular both by excess and by defect. The testing of the arguments by the laws of the syllogism is very easy, as soon as those faults have been cured. The difficulty lies in the process of cure, that is, in the analysis of the argument, and the exhibition of it in its naked form. Further, the two parts of the cure are not equally difficult: the least so by far is the weeding out of the superfluities. The filling up of the gaps is often a very troublesome task. Indeed, when a chain of argumentation is very long and complex, it very frequently—whether through looseness of thinking, or through the design to mislead—deviates so widely from regularity of form, as to admit, and often at more points than one, of being filled up in any of several alternative ways. In such an instance, we are almost certainly safe in believing that the reasoning is fallacious; and it will almost always be possible to indicate two or more specific fallacies, one or another of which must have been committed. Such a position—satisfactory where a man wishes sincerely to estimate the accuracy of his own reasonings—is not so strong as might be wished when we endeavour either to convince a candid but confused disputant of error, or to expose sophisms committed by disputants who are not candid. Another case, which is often still more annoying, while it is also more common, is that in which one and the same argument is found to involve more fallacies than one; a case which is made particularly frequent by this, that almost every fallacious argument which is really troublesome owes its force, in a greater or less degree, to its introduction of ambiguous terms.

For dealing efficiently with serious difficulties of the kind, we require two qualifications. The first is exact knowledge of the syllogistic laws, with readiness and correctness in the use of them. The second is familiar acquaintance, and aptness in the use of our acquaintance, with the various forms of fallacy, or methods of incorrect reasoning. Towards the attainment of the latter of the two, the fuller and more accurate of the treatises on logic aim at giving assistance in their supplementary consideration of fallacies. A complete enumeration and classification of fallacies has not been achieved by any of the logicians, and is indeed impossible; but those which are most common and most dangerous may be and have been identified and described, and arranged according to several different principles, each of which has its uses in particular applications.

There has been a general agreement in accepting, as the first step in the classification of fallacies, the Aristotelian division of all of them into two classes: Fallacies *in Dictione* (παρα την λεξιν); Fallacies *extra Dictionem* (εξω της λεξεως). The former are otherwise describable as Formal or Logical Fallacies, as errors in the process of reasoning itself; the latter as Material or Non-Logical Fallacies, as errors arising beyond the reasoning process. The distinction thus indicated is perfectly sound; but the application of it is difficult, and the distinction itself sometimes evaporates in the attempt to apply it. Fallacies referred to the second class by some logicians are placed in the first by others; and by some of the schoolmen (Occam for one) it has been maintained, that the Aristotelian classes are not separated by a distinction really identical at all points with the distinction between fallacies formal and fallacies material (*a parte vocis* and *a parte rei*). The details, accordingly, have been worked out variously by different writers; none of the elaborations perhaps being so useful as that of Archbishop Whately, which exhibits the author's usual success in dealing with questions having a close practical bearing. Whately's distribution and description of fallacies will, with other authorities, furnish much to the hasty outline here to be given. There may advantageously be compared with it Mr Mill's classification, which is specially designed for bringing out the forms which error is most likely to assume when reasoning is used in the process of scientific discovery. Some other recent treatises on fallacies aim at exemplifying the application of fallacious reasoning in other special departments of thought. Thus Bentham's *Book of Fallacies* may be described as showing, how certain wrong rules of judgment in political questions may be referred to the several kinds of fallacy, and most easily detected. Comte's discussion of fallacies embraces only an incidental denunciation of certain prevalent opinions, which stand in the way of his Positive Philosophy.

I. Perhaps our path may most readily be cleared, if, first of all, we regard Fallacies as distributable into Three Classes. They are either Fallacies of Assumption, Fallacies of Exposition, or Fallacies of Inference.

II. For the detection of Fallacies of Assumption, logic cannot afford any direct assistance. It can aid us only through the training it gives us in clearness of thought, and in sub-

tlety and dexterity of analysis. The error of Assumption consists in our reasoning from premises which are either untrue in themselves, or not admitted by those whom we wish to convince. The unwarranted assumption may take place in either of two ways. (1.) The more common of the two was comprehended by the Aristotelians in their second class of fallacies: it was called *petitio principii* or *quæsiti*, and is familiarly known to us as the "Begging of the Question." It consists in taking for granted the thing to be proved. We assume a premise, which either is identical with our conclusion, or (more frequently because more availably) is so far dependent on our conclusion that it cannot be held as established till the conclusion is admitted. That which is strictly denoted by "Reasoning in a Circle" is the use of two arguments of this kind, in the second of which, assuming the conclusion of the first, we thus try to prove the premise which in the first we had wrongly assumed. A genuine and complete instance of reasoning in a circle is a rare incident. (2.) The second kind of the fallacy of assumption, embraces all cases of wrong assumption not resolvable into the begging of the question. Evidently its possible varieties are innumerable. In our own reasonings, we may be tempted to assume an untrue premise by any circumstance which makes our knowledge imperfect or erroneous; in attempting honestly to convince others, we may use a premise unadmitted by them, whenever it happens that we are incompletely informed as to the state of their belief in regard to the question argued about. For the sophistical use of the fallacy, occasion may be furnished by circumstances of either kind.

III. When a fallacy of assumption has occurred, the argument is of course unconvincing, even though no error has been committed in the process of inference. So is it likewise when the fallacy is a Fallacy of Exposition. The word "relevant" and its cognates have been branded as Scotticisms: but they are extremely convenient; and in this application they are adopted by Whately. Placing this kind of paralogism among the fallacies of matter, he aptly translates its scholastic name "ignoratio elenchi" by the phrase "Irrelevant Conclusion." The Latin name bears reference to the case of disputation: the disputant who uses the fallacy is said not to know, or to profess not to know, the "elenchus," that is, the proposition which, as being the contradictory of his opponent's conclusion, it was his duty to prove. The fallacy is committed when the conclusion which we infer, although it may be legitimately deduced from premises true or admitted, is not the conclusion we were bound to prove. We denounce such a fallacy when we say, "that is not the point," or "that is not the question."

When the error is described as a Fallacy of Exposition, the feature intended to be brought into view is this; that it consists essentially in a mis-statement or wrong exposition of the question argued. Its varieties are indefinitely various: it has correctly been said that no fallacy has so wide a range as this. It is always, in one shape or another, referable to the case which is usually set down as one of its specific kinds, namely, that which is spoken of as a "shifting of the ground." Under such names as this, it is especially familiar to lawyers, and not very rare in controversies ecclesiastical and theological. Several kinds of it, which shift the ground of argument in certain specific directions, have received specific names. One such is the "Argumentum ad Hominem," when it is used fallaciously (sometimes this argument is quite legitimate); all such arguments as those which seek to challenge a conclusion, not on its own merits, but on the score of inconsistency on the part of the person maintaining it. Another is the "Argumentum ad Verecundiam," the appeal to authority; which evidently may in some kinds of questions be really an impregnable argument, while still oftener it may fairly avail for securing a suspension of judgment; but which still oftener is used illegitimately, and must always be so when the matter is of a kind in which independent thinking ought to rule. To this kind belong also all attempts (in the popular phrase) to Move the Passions; all attempts to bias the judgment through emotion, desire, or aversion, when the question is one which should be decided on grounds purely intellectual. Under this head also may most conveniently be placed all such errors as we commit, when we hold a conclusion as *dis*proved when it has merely been *un*proved; or when we treat the use of any of the last-named kinds of argument as fallacious and inapplicable to the case, the case being one in which they are legitimately applicable.

It may appear to some, that Fallacies of Exposition ought to be considered as being nothing else than a particular kind of fallacies of assumption. It is, in fact, a point carefully to be observed, that they come into play only through the unwarranted assumption of a premise or premises in the last step of the reasoning, the step which leads directly to that which is represented as the conclusion. But they are peculiar in this: that, whereas in proper fallacies of assumption there may be, and often is, a shifting of premises, there is not there, and is here, a shifting of conclusion. Altogether, the fallacies of exposition seem entitled to the middle place here given them; a place which intimates their alliance on the one side to the fallacies of assumption, and on the other to the fallacies of inferences, while it denotes also that they are essentially distinguishable from both. Here, as in fallacies of assumption, logic does not directly help us; but here, as in fallacies of inferences, the conclusion wanted is not proved.

IV. All fallacies rightly referable to the two classes hitherto described would fall, in the scholastic scheme, within the class of Fallacies *extra dictionem*. Fallacies of the Third Class above named, those of Inference, are all of them Fallacies *in dictione*.

In these a logical error has place. The conclusion which the argument is supposed or alleged to prove, does not follow from the premises. Therefore, such a fallacy is effectually exposed, as soon as the argument containing it has been resolved into the form of a syllogism. A pretended argument, doubtless, may have in it so little even of the resemblance of reasoning, that its resolution into the syllogistic form is impossible; and in such a case the varieties of possible error are indefinitely numerous: but no such case is worth considering, since none such could for a moment mislead any rational being. Again, where the argument is so like a genuine act of reasoning as to be resolvable into the syllogistic form, there are some of the syllogistic rules (such as those for negatives) which cannot have been violated. Accordingly, all the Fallacies of Inference that require enumeration are four: Illicit Process, either of the Major Term or of the Minor; Non-Distribution of the Middle Term; and the occurrence of More Terms than Three. The last of these fallacies is found, on a strict analysis, to comprehend the other three: all of these are just specific instances of it. In a legitimate act of reasoning, we use three terms and three only, comparing each of these once with each of the other two. Every logical error consists really in the introduction of a fourth term, which carries with it the want of one of our three comparisons. The fallacy may be, our having either two major terms, two minors, or two middles. This doctrine is worth remembering, because of its bearing on that kind of logical fallacy which is practically most important.

A distinction now presents itself, separating Fallacies of Inference into Two well-marked Genera. First, the fallacy may appear on the face of the argument: it may be evident before we have considered the meaning of the terms, or when (as in the use of the symbolic terms so common in logical examples and essential in algebra) none of the terms has any appropriated meaning. Secondly, the fallacy may

not appear until we have ascertained, by interpretation, the meaning of the term in which it occurs. Fallacies of the first kind have been called Purely Logical Fallacies, those of the second kind Semi-Logical. The names are justly applied; for interpretation of terms is not a function of logic, and fallacies of the second kind are not cognisable by logical tests until the process of interpretation has been performed.

(1.) The Fallacies Purely Logical are not named by Aristotle among the thirteen kinds into which he distributes all fallacies; and they receive little attention, oftenest none at all, in the special discussions on fallacies by the schoolmen. The reason is plain. The systematic doctrines of the syllogism, taught in preceding parts of the logical treatises, were supposed to have furnished, for the detection of these fallacies, all the aid that is either attainable or needful. They should be at least named, however, in any scheme professing to enumerate the possible kinds of fallacies; and it is questionable whether they do not deserve, in modern times, a larger share of attention than that which may once have sufficed for them. "We live," says Mr De Morgan, "in an age in which formal logic has long been nearly banished from education—entirely, we may say, from the education of the habits. . . . . Offences against the laws of syllogism (which are all laws of common sense) are as common as any species of fallacy; not that they are always offences in the speaker's or writer's mind, but that they frequently originate in his attempt to speak his mind. And the excuse is, that he meant differently from what he said; which is received because no one can throw the first stone at it; but which in the middle ages would have been regarded as a plea of guilty." Even for the applicabilities of the syllogistic tests to the argumentative section of our common affairs, notice is merited by the hint here involved, of the intimate relation between the fallacies purely logical, and those others (avowedly very frequent) which we speak of as semi-logical. Of the close bearing of the theory of the syllogism on the theory of scientific discovery, proof will be found by any one who glances at Mr Mill's treatise on Fallacies, in his great logical work.

(2.) All the Semi-Logical fallacies of inference are referable to one cause, Ambiguity of Terms. Two remarks are here necessary. In the first place, we must understand distinctly what the logicians mean, when they say that a syllogism is fallacious because one of its terms is ambiguous. Every term we can use, every single word, and, far more clearly, every combination of words, is ambiguous in this sense, that it is susceptible of more meanings than one; but when the use of an ambiguous term is said to be the source of a fallacy, what is signified is, that, each of the three terms of an argument occurring twice in it, the term in question is actually used in one of its meanings on its first appearance, and in another on its second. That every phrase or word is capable of being so used, is a fact which shows how extensive is the risk we run of committing the Fallacy of Ambiguity. In the ordinary and familiar uses of argumentation, where we employ words whose significations are fixed only by custom and tacit convention, our liability to the error is proportional to the closeness of relation between two meanings of any given word or phrase, *plus* the probability that both of the meanings will suggest themselves to us or to others in the course of a given argument. In philosophical and scientific discussions, there is no effectual protection against mistakes thus arising, unless by the precedent definition of every term that is to be used; a precaution which, notoriously, is not fully attainable anywhere except in the pure mathematics. Secondly, the books on logic are nearly unanimous in describing the ambiguity that causes fallacy, as occurring in the middle term only: the fallacy is called that of "ambiguous middle," even by writers who explicitly allow that this is not the only possible instance. It is true that the middle term is much oftener used in two meanings than is either of the other terms; chiefly because, not emerging in the conclusion of an argument, it is by much the least prominent of the three. But undoubtedly the fallacious double meaning is to be found sometimes in the major term or in the minor.

It is plain that, when the Fallacy of Ambiguity is committed, the argument has really more terms than three. It is only in appearance that a term used in two meanings is one term: it is really two terms; it is one term in the one of its meanings, and a different term in the other. It is equally plain that, in one or another of its forms, this is the most common, and also the most dangerous, of all instruments that effect either mistake or deception. It is, as was asserted a little ago, the most frequent ally of fallacies of the other kinds; which, when the case does not lay open a firm enough foundation for them to occupy alone, gain support by their union with a convenient ambiguity. But the fallacy is so tempting, through the manifold imperfections of language as the vehicle of thought, that, even without foreign aid, it is continually productive of error. It is the curse of all those sciences which have human nature as their object-matter, especially of those higher and more analytic ones which, in the incorrect phraseology of common use, are often slumped together by the name of metaphysics. Its effects are not less injurious, when the communication of belief is aimed at through that which we speak of as eloquence, whether oral or written. The loose and inconclusive declamation, both of sophistry and of imperfect knowledge, gains a hearing through its adoption of one name to denote two things substantially different; and, in applications less extensive, but not less serious, truth is obscured, or positive error substituted for it, by the eagerness of cultivated writers to attain what they regard as elegance of style, for which, in our day, one of the favourite prescriptions is a needless variation of phrase.

The shapes assumed by the Fallacy of Ambiguity must clearly be so diverse, as to baffle all attempts at classification, or even enumeration. The ambiguity which is caused by the construction of clauses (the amphiboly or amphilogy of the old writers) is probably less frequent than that (the homonymy of Aristotle) which is caused by the double meaning of a single word or term. The Homonymy, or ambiguity strictly so called, arises out of something in the term itself; and the sources of it might be shown to embrace all those relations of things which, when used in an opposite direction, give rise to tropes and figures of speech. Several varieties of ambiguity spring from the particular way in which the term is applied on the particular occasion. Of these, the most nearly akin to the homonymy (and rightly transferred by Whately from the class of material fallacies) are the "Fallacia a dicto simpliciter ad dictum secundum quid;" and the counter-fallacy, called also the "Fallacia accidentis." In each of these, a term is used absolutely in the one of its appearances, and with a qualification in the other. If, from assuming as to the term taken absolutely, we infer in regard to it as qualified, the fallacy is of the first kind; if we infer the other way, it belongs to the second. Like to this pair in several respects are the counter-fallacies of Composition and Division. In the fallacy to which the former of these names is strictly applicable, we assume that something is true of a common term taken distributively, or, in other words, that something is true of each of the individuals comprehended under the term; and we thence infer to the term taken collectively, that is, to the aggregate of those individuals. In the counter-fallacy the process is reversed. The principle of the two fallacies last described affords also the easiest means of exposing many fallacies, in which the form of the argument does not directly present the antithesis of collection and distribution, and which, accordingly, might be placed under other heads, and analysed by a different method.

The heads thus named are very far indeed from presenting an exhaustive list even of the principal Fallacies of Ambiguity. It is the fact, indeed, that a vast proportion of the errors in reasoning by which we are perplexed or seduced, are referable, in the first instance, to that wide class which Mr Mill calls Fallacies of Confusion: the main reason of the fact lies in the frequency with which double meanings insinuate themselves into acts of ratiocination; and, when we are at a loss to determine the class to which an argument evidently fallacious may most properly be referred, and are consequently doubtful as to the best method of exposing it, a rigorous analysis will probably show that the difficulty is caused by some deeply lurking fallacy of ambiguity. (W. S.)

FALLING SICKNESS. See EPILEPSY.

FALLING or SHOOTING STAR, a luminous meteor which appears suddenly darting through the air. Falling stars occur at all seasons, but most frequently in the latter part of autumn, especially during the prevalence of the aurora borealis, and most commonly in the lower regions of the atmosphere. These phenomena are now generally supposed to depend on electricity.

Sir Humphrey Davy, however, in a lecture delivered at the Royal Institution, gave many reasons against this theory; conceiving that they are rather to be attributed to falling stones. It may also be mentioned that Chladni, in his work on Fiery Meteors (Vienna 1819), considers them as solid bodies formed above the regions of our atmosphere, and classes them with aërolites. Some consider them as extreme portions of the zodiacal light occasionally crossing the earth's orbit. It has been observed that when falling stars appear in great numbers, the direction of their course is similar. See ELECTRICITY, and METEOROLITE.

FALLOPIAN TUBES, in *Anatomy*, two ducts arising from the womb, one on each side of the fundus, and thence extending to the ovaria. They are called *tubæ* from their form, which bears some resemblance to a trumpet; and derive their denomination of Fallopian from Gabriel Fallopius, who was the first to indicate their use and office.

FALLOPPIO, GABRIELLO, in Latin FALLOPIUS, one of three anatomists to whom Cuvier assigns the honour of having restored, if not actually created, their science; Vesalius and Eustachius being the other two. He was a native of Modena, and though the year of his birth is not accurately known, it may be assigned to the end of the first quarter of the seventeenth century. He received his medical education at Ferrara, and in that city he established himself as a teacher of anatomy, after completing a scientific tour through the most civilized portions of Europe. From Ferrara he removed to Pisa, attracted thither by the liberal offers of Cosmo I. Grand Duke of Tuscany, and from Pisa to Padua, where the Venetian Senate appointed him to succeed Vesalius. His career in his new sphere, though brilliant, was short, as he died in 1562, after holding his various appointments for only eleven years. His only work, the *Observationes Anatomicæ*, was first published at Venice in 1561, and has been frequently reprinted. For an account of the services which Fallopius rendered to anatomical science, see art. ANATOMY, vol. ii., p. 759.

FALMOUTH, a municipal and parliamentary borough and market-town of England, county of Cornwall, on the S. side of Falmouth Harbour, 15 miles N.N.E. of Lizard Point, and 267 miles S.S.W. of London. It is governed by a mayor, 4 aldermen, and 12 councillors, and in conjunction with Penryn, about 2 miles distant, returns 2 members to parliament. Pop. (1851) of town 4953; of the parliamentary borough of Falmouth and Penryn 13,656; registered electors 906. In the early part of the seventeenth century Falmouth consisted only of a few fishermen's huts, but soon after this Sir John Killegrew, having obtained the permission of James I., constructed a new quay and laid the foundation of the present town. Its subsequent prosperity was a consequence of the excellence of its harbour, and its proximity to Land's End. For about 150 years it was the port from which the mail packets for the Mediterranean, Spain, the West Indies, and South America, were despatched, but it is now for the most part superseded by Southampton. The harbour is one of the best refuges for shipping in England. Its entrance, between St Anthony's Head on the E. and Pendennis Castle on the W., is about a mile in width, and it thence stretches inland about five and a half miles. It has depth of water and excellent anchorage for the largest ships, and vessels of considerable burden can discharge their cargoes at the quay. The number of vessels registered as belonging to the port on 31st Dec. 1853 was 124 vessels of 8771 tons burden. The number that entered and cleared at the port during 1853 was as follows:—coasting trade, inwards, sailing vessels 710, tonnage 40,271; steam vessels 141, tonnage 29,447; outwards, sailing vessels 215, tonnage 9195; steam vessels 75, tonnage 7151: Colonial and foreign trade, sailing vessels, inwards, 161, tonnage 13,379; outwards, 147, tonnage 17,934. The exports include copper, tin, tin-plates, woollen goods, pilchards and other fish, &c., and a considerable coasting trade is carried on with London, Plymouth, Bristol, Dublin, &c. The town consists chiefly of a long but narrow street extending along the shore. It contains some fine public buildings, among which may be mentioned the Public Rooms, Polytechnic, town-hall, jail, and market-house. It has also a reading room, mechanics' institute, public baths, savings-bank, and dispensary. Market-days Tuesday and Saturday.

FALSTER, one of the Danish islands in the Baltic, lying E. of the island of Laland, from which it is separated by a narrow strait. It is of an irregularly triangular form, about 27 miles in length from N. to S., but of very variable breadth, the greatest not exceeding 18 miles. The surface is elevated but almost entirely flat. It is richly wooded, fertile, and well cultivated. The chief productions are corn, flax, hemp, hops, potatoes, and fruits. Corn, apples, and other products are exported in considerable quantities. Cattle, hogs, poultry, and bees, are abundant. This island is divided into two districts, north and south Falster. The chief town, Nykiöbing, is on the western side of the island, and in 1850 contained 2123 inhabitants. Pop. of entire island (1850) 23,249.

FALUN, or FAHLUN, a town of Sweden, capital of a cognominal *laen*, and situated near the W. shore of lake Runn, 73 miles W. of Gefle. The town is built chiefly of timber, and the inhabitants, amounting to about 4500, are mostly engaged in mining and smelting. West of the town are the celebrated Falun copper mines, which are the oldest and most celebrated in Europe. They have an historical existence of upwards of 600 years, and it is certain that they are much older—probably by many centuries. In the town are museums of mineralogy and geology, a school of practical mining, a model room, and a large scientific library. The fumes arising from the copper-smelting works destroy vegetation in the vicinity of the town, but do not seem to be injurious to human life; on the contrary, the freedom of the inhabitants from cholera and other serious epidemics which have visited the country has been ascribed to this cause. The laen of Falun has an area of 12,113 square miles, and in 1850 contained 151,497 inhabitants.

FAMA, the goddess of report or rumour, is represented by the ancient poets as the youngest daughter of the Earth, and possessed of wings, with as many ears, eyes, and tongues, as feathers. She is said to have a palace in the air, and to fly through the world by day and by night, hearing and observing all that passes among men. She is mentioned by Hesiod, and particularly described by Virgil and Ovid. She is also described by Chaucer in his *House of Fame;* and by Pope in his *Temple of Fame*, in the following lines:—

So from a spark that kindled first by chance,
With gathering force the quick'ning flames advance:
Till to the clouds their curling heads aspire,
And towers and temples sink in floods of fire.
When thus ripe lies are to perfection sprung,
Full grown, and fit to grace a mortal tongue,
Through thousand vents, impatient, forth they flow,
And rush in millions on the world below.
Fame sits aloft, and points them out their course,
Their date determines, and prescribes their force:
Some to remain, and some to perish soon;
Or wane and wax alternate like the moon.
Around, a thousand winged wonders fly,
Born by the trumpet's blast, and scattered through the sky.

Temple of Fame.

FAMA CLAMOSA, in the judicial procedure of the church of Scotland, a ground of action before a presbytery against one of its members, independently of any regular complaint by a particular accuser.

Any person who is of good character may prefer to the presbytery a complaint against one of its members; but the presbytery is bound not to proceed to the citation of the person accused until the accuser under his hand shall give in the complaint, with some account of its probability, and undertake to make out the libel, under the pain of being considered as a slanderer. But when such an accusation is brought before them, the members are obliged to examine or try the case. Besides this, however, the presbytery considers itself obliged to proceed against any of its members, if the *famá clamosa* of the scandal is such that the person implicated cannot be vindicated unless they begin the process. This they can do without any particular accuser, after they have inquired respecting the origin, occasion, and authors of this report. It is a maxim in the Kirk of Scotland, that religion must suffer if the scandalous or immoral actions of a minister are not corrected; and wherever a minister is reputed guilty of any immorality, although previously the most popular preacher in the kingdom, he is then deserted by his congregation. Therefore the presbytery, for the sake of religion, is obliged to proceed against a minister in case of a *fama clamosa.* This, however, is generally done with great caution. After they have considered the report raised against him, they then order him to be cited, and draw out a full copy of what is reported, with a list of the names of the witnesses to be produced for proving the allegation. He is then formally summoned to appear before them; and he has notice served upon him, at least ten days before the time of his appearance, to give in his answers to what is termed the *libel.* If at the time appointed the minister appear, the libel is read to him, and his answers are also read. If the libel be found relevant, then the presbytery endeavours to bring him to a confession. If a minister absent himself by leaving the place, and prove contumacious, without making any relevant excuse, a new citation is given him, and intimation is made at his own church when the congregation is met, that he is to be holden as confessing, since he refuses to appear before them; and accordingly he is deposed from his office.

FAMAGOSTA, or Famagusta, a seaport-town on the east coast of the island of Cyprus, occupying a low situation between two promontories, in N. Lat. 35. 7. 40., E. Long. 33. 59. It was formerly strongly fortified, and on the land side was surrounded by a deep ditch and thick walls flanked with towers, but these have now fallen into decay. The palace, cathedral, churches, and other buildings, are mostly in ruins, and the town at present probably does not contain more than 200 inhabitants. The harbour was formerly good, but from the accumulation of sand at its mouth it is now only accessible to small craft. Famagosta occupies the site of the ancient Arsinoe. Under the Venetian rule it was one of the principal cities of the Levant.

FAMILY. In a restricted sense the word is applied to those who form one household, whether connected by ties of relationship or not: in a more extended sense it includes the descendants from a common progenitor. Among the Romans the word familia (from *famulus*, a slave or servant) was applied to the household establishment of servants. It was also applied to a collective body of freemen, or to a particular branch of a Roman *gens.* Thus, the gens Æmilia had such subdivisions as the families of Mamerci, Scauri, Lepidi, &c. Of all the institutions that have been established among men, that of the family is the most primitive and the most humanizing. The Creator seems to have placed it as the corner-stone of the social edifice—as the foundation of every organization, political, civil, or religious. We have in it the most manifest proof that man was created to live in society, to go on perfecting his faculties through the multiplied connections which bind him to his kind, and to purify his soul by the affections of his heart. In the family sanctuary we have a clear evidence, that the pretended *state of nature*, which has been represented as the primitive condition of man, is but a barbarous fancy totally opposed to the benevolent designs of the Author of nature.

From the investigation of statistics we learn, that on an average the number of children in one family where polygamy does not exist is—

Years.	In England and Wales. Number of Families.	Average of Persons in each Family.	Average of Persons in each House.	In Scotland. Number of Families.	Average of Persons in each Family.	Average of Persons in each House.
1801	1,896,723	4·688	5·643	364,079	4·418	5·461
1811	2,142,147	4·745	5·655	402,068	4·491	5·939
1821	2,493,423	4·813	5·747	447,960	4·669	6·125
1831	2,911,874	4·772	5·600	502,301	4·707	6·401
1841	Not returned.	?	5·406	550,428	4·760	5·211
1851	3,712,290	4·827	5·469	600,098	4·814	7·801

Family, is used popularly among naturalists to denote an order, class, or genus of animals, or other natural productions having certain characters in common by which they are distinguished from others.

FAN, a simple and well-known implement employed to produce coolness by agitating the air.

Upwards of 3000 years ago the artist of ancient Egypt painted the fan on the walls of the tombs at Thebes, where the Pharaoh sits surrounded by his fan-bearers. These officers acted as generals or marshals, using their fans as standards in war, and in peace they assisted the Pharaoh in the temple, and waved their variegated fans both to produce a cooling breeze, and to guard the sacred offerings from the contamination of noxious insects.

The fan is mentioned by Euripides, and its Grecian forms were far more beautiful than the Egyptian. The wings of a bird joined laterally and attached to a slender handle formed the simple yet graceful fan of the Priest of Isis, when Isis became a Grecian deity. It was sometimes formed of feathers of different lengths, spread out in the form of a semicircle, but pointed at the top. This fan, the precise type of the state-fan of India and China of the present day, was waved by a female slave.

The fan is mentioned by Terence and Ovid; and was termed indifferently "flabellum" or "muscarium." When the Romans were at meals, it was the duty of certain slaves, when the weather was warm, to cool the room with fans and to drive away the flies.

The modern Greek church places a fan in the hands of its deacons to guard the officiating priest and the elements from desecration.

When the fan was brought to France by Catherine de' Medecis, it was so constructed that it could be folded in the manner of those used in the present day. Fans in the luxurious reigns of Louis XIV. and Louis XV., shone with gilding and gems, and were ornamented with the pictures of Boucher

and Watteau. At that time no toilet was esteemed complete without a fan, the cost of which was frequently as high as from L.12 to L.15 sterling.

In fan-making the Chinese and French are the great rivals, and may be said to monoplise the supply of the whole world. In the lacquered fans the superiority of the natives of China is fully admitted. These are unrivalled both in lowness of price and in originality of design, brilliancy of colouring, and in general correctness of workmanship. In China the manufacture of fans is almost entirely confined to Canton, Soutchou, Hang-tchoo, and Nankin. The fans of ivory and bone, and of feathers, are made exclusively for exportation to Europe or America. Those used by the Chinese are of bamboo, polished or japanned, and covered with paper. They are sold at from 10d. to 14s. 6d. per dozen, according to the quality of the frame and the design of the leaf.

In France fan-making has arrived at a high degree of perfection, and presents a remarkable instance of the subdivision of labour: not less than about twenty different operations, performed by as many pairs of hands, are necessary to the production of a fan which sells for less than one halfpenny. The number of fan-makers, or *éventaillistes*, in Paris in 1827 was 15, who employed 1010 workmen (344 men, 500 women, and 166 children), and sold about L.40,420 worth of fans. In 1847, there were 122 fanmakers, comprising chamber-masters as mounters, feuillistes, painters, and colourers. The value of the fans made was L.110,000. These masters employed 575 workpeople (262 men, 264 women, 29 youths, and 20 girls). The workmen on the average can earn 3s. and the women 1s. 8d. per day. Some small fans are sold at a price as low as 5d. per dozen.—(*Reports of the Juries on the Works of Industry at the Exhibition*, 1851.)

FANATICISM (from *fanum*, a temple). Originally, the fanatic was he who performed the duties of a temple, the religious personage, the priest who in the temple was the organ of the god. Whatever may be its etymology, the word *fanaticism* has long been used in a much more limited and discreditable sense. It signifies in common language a religious exaltation which perverts reason and leads to actions that are reprehensible, but which the fanatic believes he ought to do to please God. This is religious fanaticism. In a wider sense this name is given by analogy to all excessive prepossession with any order of ideas, whatever that may be; thus there is a fanaticism for liberty, a fanaticism for patriotism, love, &c. No country has given more lamentable proofs of the pernicious nature of both political and philosophical fanaticism than France, as in the age of philosophical scepticism which preceded the revolution, and in the phrenzy for liberty which produced the fearful excesses and inhumanity of the Terrorists. This fanatical furor produced equally disastrous results under the Reaction or Abolitionist party in Naples and in Spain. Among the republican fanatics of France there were no doubt men of true nobility of soul who were led to the commission of crime by blindly following the hypocritical zeal of their leaders; others, under the cloak of zeal for the public good, were actuated by criminal desires and propensities which have nothing in common with fanaticism. Sir James Mackintosh says: "Fanaticism is the most incurable of all mental diseases, because in all its forms—religious, philosophical, or political—it is distinguished by a sort of mad contempt for *experience*, which alone can correct the errors of practical judgment."

Fanaticism is a real moral malady, a kind of madness, with which imagination has much to do. It finds at first some difficulty in supplanting reason; but if it succeed it becomes then the sole rule of conduct, and generally induces a state of dejection and melancholy. It is never universal in the individual, but rather belongs to that class of mental maladies which is called monomania.

The most deplorable characteristic of this mental disorder is, that it is really contagious, as are all those which depend on the imagination. When once it has established itself in a country, it often assumes the character and authority of a principle, so that many may be for a length of time victims to it without being excited by the same feelings as those in whom it originated. It is thus that human sacrifices most probably commenced and were continued, and that the supposed superior sanctity of the first anchorites spread and multiplied the various orders of monks and friars.

The following is an instance of fanaticism in its most frightful character:—Kiesewetter in his *Pathologie de l'Âme Humaine* relates that a shepherd who dwelt in a village in Prussia often conversed with the schoolmaster of the place on religious subjects. The schoolmaster affirmed that faith and piety were then not nearly so great as in ancient times, especially in the time of the patriarchs, and instanced the faith and obedience of Abraham when commanded to offer up his son Isaac. The shepherd, who had three sons whom he dearly loved, conceived that it would be the most incontestable evidence of his faith and piety were he to sacrifice them to God; and when the tears and prayers of the children for a time stayed his hand and revived humanity in his heart, he reproached himself for listening to the suggestions of the evil spirit, which had prevented him from consummating his good work; but after a short struggle with himself, fanaticism triumphed, and the children fell under the hatchet of their wretched father. This instance, however, may more properly come under the class of monomania. A more criminal species of fanatical acts are those of individuals who have attempted to destroy rulers and others whom they have conceived to be enemies to religion or to political liberty; as, for instance, Jacques Clément, who killed Henri III. of France (1589), and Ravaillac, the assassin of his successor, Henri IV. (1610), and the murderers of Archbishop Sharpe in 1679.

George Fox, Emanuel Swedenborg, and Madame Guyon, are examples of a mystical state of this phrenzy. The fanaticism displayed by the Independents in Cromwell's army and the Scottish Covenanters in the time of Charles II., is of a more noble character, from its being combined with piety and a love of liberty, which nerved its subjects for deeds of valour and endurance. There are instances of this disorder which are only distinguished by ridiculous folly and delusion, such as that of Johanna Southcote, and that of Mrs Buchan, who, in the neighbourhood of Dumfries, in 1786, persuaded her followers that they should never die, but soon be received up into heaven. One morning she led out her people to a hill to take their flight upwards. There they waited till they were tired, but still found themselves fixed to earth; but she assured them that it was their want of faith that prevented their ascension. She then persuaded them that it would be necessary to fast forty days and forty nights, and then they should be taken up. They tried the experiment till some were near dying of starvation, but the trial was too severe, and they dropt off one by one.

When fanaticism manifests itself in atrocities such as murder and assassination, it is more startling; but it is infinitely less disastrous than in the milder type when those who believe that an adherence to certain theological dogmas or actual observances are so essential to the salvation of the soul, that they consider it their duty not only to observe them themselves, but to compel others to take the same track to heaven, although it should be necessary even to resort to pains and penalties to force them.

It is this that has desolated the finest portions of the earth; and it is much to be regretted that the cruelty and oppression of fanaticism has not been confined to the be-

lievers in the Koran or the Shasters, but that in a greater or less degree it has afflicted all the countries calling themselves Christian.

The best means of counteracting the tendency to fanaticism is a vigorous and rational education and a philosophical training. If ignorance is the mother of devotion, it would be unreasonable to expect that such devotion should be enlightened, pure, spiritual, and beneficent. The mind when left uninstructed cannot comprehend the true, and clings more closely to the false.

FANCY. See APPARITIONS, and METAPHYSICS.

FANIONS, small flags carried along with the baggage of an army.

FANNERS, in *Agriculture*, are implements for winnowing corn, or for separating the chaff, husks, and dust, from grain seeds. For descriptions of winnowing machines, see AGRICULTURE, vol. ii., p. 283; and PNEUMATICS.

Among the ancients corn was separated from the chaff by a kind of shovel or broad basket, with which it was thrown in the direction of the wind; and sometimes it was cleaned by means of a sieve, as among the Jews and Greeks. In Virgil (*Georg.* i.) the simple implement used for winnowing is styled *mystica vannus Iacchi*. The *vannus* was borne in the processions celebrated in honour of Bacchus and Ceres, whose rites had a continual reference to rural occupations. It was also used at initiations into the mysteries, as an emblem of that purity of life which was essential; or in other words, to denote the separation of the virtuous from the vicious and profane.

FANO, a city of the Papal States, in the legation of Urbino-e-Pesaro, occupying the site of the ancient *Fanum Fortunæ*, so named from the temple of Fortune there. It afterwards took the name of *Colonia Julia Fanestris* from a colony of veterans who were established here by Augustus; and a triumphal arch of white marble was erected in honour of that emperor, which still forms one of the gates of the city. Fano is situated in a rich and fertile plain on the shores of the Adriatic, at the mouth of the Metauro, 7 miles S.E. of Pesaro. Pop. 10,000. It is inclosed by old walls, with a lofty bastioned front towards the sea, and is richer in churches and paintings than any other town on the east coast of Central Italy. Its cathedral and many of its churches are fine buildings, richly adorned with marbles and frescoes, and containing several masterpieces of the great Italian painters. Fano has a college of Jesuits, a public library, and a modern theatre said to be one of the finest in Italy. Its harbour is so choked up with sand as to be accessible only to vessels of the smallest size, which trade in corn. The town has some manufactures in silk.

FANSHAWE, SIR RICHARD, a distinguished cavalier and accomplished man of letters, was the son of Sir Henry Fanshawe of Ware Park, Hertfordshire. He was born in June 1608, studied at Jesus College, Cambridge, travelled for some time in France and Spain, acquiring the languages and investigating the institutions and manners of those countries; and on his return he entered on that course of diplomatic and public service in which he so eminently excelled. His sympathies and exertions were all on the side of the royalists. Charles I. created him a baronet; and in the service of Charles II. he was taken prisoner at the battle of Worcester. This led to his imprisonment; but through the intercession of Cromwell (who could be a generous as well as formidable enemy) he was liberated. The Restoration brought brilliant hopes to the cavaliers, and Fanshawe was promised the appointment of one of the Secretaries of State. He was however, like many others, doomed to disappointment. Through the influence of Monk the office was given to Sir William Morrice, whom Lady Fanshawe, in her interesting *Memoirs*, terms "a poor country gentleman of about L.200 a-year; a fierce Presbyterian, and one who never saw the king's face." Sir Richard was afterwards employed as ambassador at the courts of Spain and Portugal, and he negotiated the treaty of marriage between Charles II. and the Infanta, Donna Catharina, daughter of John VI. He had just completed an important treaty with Spain, when he was seized with fever at Madrid, and died there on the 4th of June 1665. The widow of Sir Richard (daughter of Sir John Harrison) honoured his memory with a *Memoir*, which forms one of the most interesting, noble, and affecting, of our domestic histories. Though so constantly engaged in posts of honour and peril, Sir Richard Fanshawe found leisure for several translations. The earliest of these was an English version of the *Pastor Fido* of Guarini, published in 1646. This translation has been eulogised by Denham, who applies to it a couplet which seems to draw the line with great felicity between a bad and a good translation:—

> "They but preserve the ashes, thou the flame;
> True to his sense, but truer to his fame."

Fanshawe also translated Fletcher's *Faithful Shepherdess* into Latin verse, the *Lusiad* of Camoens, and some of the Odes of Horace. He was also the author of "A Discourse of the Civil Wars of Rome."

FANTASIA, in *Music*, an Italian term which means either a composition improvised upon the organ, or pianoforte, or violin, &c., according to the free fancy of the performer, and not elaborated according to any strict rules or forms of construction, while still subject to the fundamental laws of melody, modulation, and harmony;—or, a written composition in which the musician indulges his fancy unrestrained by conventional forms of developed themes and movements, but yet bestows more careful attention upon details than is required in the improvised fantasia. One of the finest specimens of a written fantasia is Mozart's in C minor, No. 24 of the list of his works published in 1805 by J. André of Offenbach. The "*Fancies*" of Bird, Bull, and other old English musicians of the sixteenth century, were dry and difficult compositions for a keyed-instrument, worked out upon popular airs. (G. F. G.)

FARCE originally denoted a droll petty show exhibited by charlatans and buffoons in the open street, in order to gather the crowd together. The word is derived, through the medium of the French, from the Latin *farcire, to stuff*, and literally signifies *forced meat* or *stuffing;* and was applied to such exhibitions in allusion to the variety of jests, jibes, and tricks with which the entertainment was interlarded.

The modern farce is a dramatic piece of a low comic character, usually played as an after-piece. Its sole end being to excite mirth, it admits of greater licence than comedy as to probabilities in constructing and developing the plot, and in short may be said to exclude nothing, however wild or extravagant, that may contribute to the amusement of the audience. Dryden observes—"Farce is that in poetry which grotesque is in a picture: the persons and actions of a farce are all unnatural, and the manners false."

FARCY, a disease of the horse, allied to glanders. See VETERINARY SCIENCE.

FAREHAM, a market-town of England, county of Hants, situated at the N.W. extremity of Portsmouth harbour, 73 miles by road and 84 by the South-Western Railway from London. The town consists chiefly of one wide street; and during the summer months is much resorted to for sea-bathing. It has a handsome assembly-room and other conveniences requisite for such places. The manufactures are chiefly sackings, ropes, and coarse earthenware. Some shipbuilding is also carried on. Fareham has some trade in corn, timber, and coal. Market-day, Monday. Pop. (1851) 3451.

FAREWELL, CAPE, the S. extremity of Greenland, on the E. side of the entrance of Davis' Straits, in N. Lat. 59. 49., W. Long. 43. 54. Also a cape at the N. extremity of the middle island of New Zealand; S. Lat. 40. 31., E. Long. 172. 47.

FARINA, the meal or flour of any species of corn; or of any starchy root, as potato, arrow-root, &c.

FARM, or FEORME, an old Saxon word which originally signified *provisions;* and which afterwards came to be used instead of *rent*, because anciently the principal part of the rent of lands was paid in corn, poultry, &c. Hence the word farm, by a gradual departure from its original sense, came to signify the estate or lands (*firma*) so held; and the person holding lands in this way was called a *firmarius* or farmer.

According to the census returns of 1851, the total number of farms in Great Britain was 283,378; of which 223,271 were in England and Wales, 56,150 in Scotland, and 3957 in the islands in the British seas. Of the total number of farms,

190,573	were under			100 acres.
52,912	from	100	to	200
20,603	...	200	...	300
9,031	...	300	...	400
4,063	...	400	...	500
2,248	...	500	...	600
2,816	...	600	...	1000
1,132	...	1000 and upwards.		

The size of 2558 farms was not stated. The average size of farms is 102 acres; and altogether they occupy about one-half of the territory of Great Britain. For observations on farms, see AGRICULTURE, vol. ii., p. 364, *et seq.*

FARMER, HUGH, the well-known author of the *Essay on Demoniacs*, was an English Dissenting minister. He was born in 1714, in the neighbourhood of Shrewsbury, and after receiving a good elementary education, became finally the pupil of the celebrated Dr Doddridge at Northampton. On completing his studies, he was appointed to a charge at Walthamston in Essex, officiating at the same time as chaplain to a wealthy gentleman in the neighbourhood, in whose house he lived. This residence he afterwards exchanged for the more hospitable dwelling of a less aristocratic parishioner, under whose roof he remained for thirty years, thinking out and composing those valuable treatises which afterwards gained him so much distinction. His first work of importance was published in 1761, under the title of *An Inquiry into the Nature and Design of our Lord's Temptation in the Wilderness;* and was designed to prove that the whole of that memorable transaction took place only in vision, and was intended to prefigure the labours and offices of our Lord's future ministry. The originality of the idea, and the great learning with which it was maintained, secured for it a wide and speedy circulation. In 1765 a second edition of it appeared considerably enlarged, in which the objections started against the first edition were answered; and the several subsequent editions were all calculated to strengthen the author's position. In 1771 appeared his "Dissertation on Miracles, designed to show that they are Arguments of a Divine Interposition, and absolute proofs of the Mission and Doctrine of a Prophet." This is the author's most valuable contribution to theological science. The clamour raised against the author, of having borrowed from a treatise on the same subject by Lemoine, was silenced by himself in his *Examination* of the essay of that divine. Farmer's next publication, and the one by which he is best known, though it can hardly claim to be his ablest work, was his *Essay on the Demoniacs of the New Testament*, which may be regarded as a sort of sequel to his treatise on Miracles. The propositions maintained in this volume were attacked with considerable ability but very moderate success by Dr Worthington, a learned clergyman of the English Church, and afterwards by Mr Fell, a Dissenter. Farmer's last work of importance was published in 1783, under the title of "The General Prevalence of the Worship of Human Spirits in the Ancient Heathen Nations, asserted and proved." In 1761, Farmer removed to London, where he continued to officiate to the congregation of Salter's Hall till his death in 1787.

FARMER, *Richard*, D.D., author of the *Essay on the Learning of Shakspeare*, was born at Leicester in 1735. He was educated first at the free grammar-school of his native town, and afterwards at Emmanuel College, Cambridge, of which in 1760 he became classical tutor and in 1775 master. In that latter year also he was appointed vice-chancellor, and three years afterwards chief librarian of the university. In 1780 he was appointed to a prebendal stall in Lichfield, and shortly afterwards prebendary of Canterbury; but after holding this office for a few years, he exchanged it in 1788 for that of a canon residentiary of St Paul's. As none of these offices required constant residence, Dr Farmer spent most of his time at Cambridge, owing among other things it is said to a disappointment in early love which disinclined him to the active business of the world; and there, after a long and painful illness, he died in 1797. A monument erected in his honour bears an inscription by Dr Parr, who describes him as *Vir facetus, et dulcis festique sermonis, Græce et Latine doctus, in explicanda veterum Anglorum poesi subtilis et elegans.* The latter portion of this epitaph has reference to Dr Farmer's only work, his *Essay on the Learning of Shakspeare*, in which the critic proves that the great poet's knowledge of the ancient classics was derived not from the originals, but from translations of which he copied even the blunders. In proving this point, Dr Farmer incidentally illustrates so well the text of Shakspeare, that no other English criticisms on the great dramatist, save the widely dissimilar *Lectures* of Coleridge, and occasional digressive comments interspersed throughout the works of Thomas Carlyle, Mrs Jameson, Mrs Clarke, and other authors of our own day, can compare with his in value.

In politics Dr Farmer was a confirmed Tory; and though an obstinate enemy to change of most kinds, he effected great improvements in the sanitary condition of Cambridge. He greatly enjoyed social recreation, and is said to have had more of the spirit of a boon-companion than of a clergyman. He was twice offered a bishopric by Mr Pitt, and on both occasions he declined the honour which would have debarred him from visiting the theatre, which, it seems, he regularly attended when any work of his favourite author was announced.

FARNABIE, or FARNABY, THOMAS, a grammarian and critical scholar, was born in London in 1575. In his sixteenth year he entered Merton College, which, however, as he was of a restless disposition, he left somewhat abruptly. Passing over into Spain, he embraced the Catholic faith, and entered a college of the Jesuits in that country. The severity of the discipline, however, displeased him, and in 1595 he left the college, to join the last expedition of Drake and Hawkins. He is said to have served afterwards as a soldier in the Low Countries; but he at length returned to England in great poverty, and to meet his immediate necessities opened a school in Cornwall, where, however, he met with no immediate success; and removed to Mattock in Somersetshire, where he began to prosper beyond his utmost hopes. He staid here long enough to establish a considerable reputation, on the strength of which he removed to London and organized a school there, which at one period was attended by upwards of 300 pupils, chiefly the sons of noblemen and gentlemen, and, according to Antony à Wood, turned out a greater number of churchmen and statesmen than any school taught by one man in England. He now received the degree of M.A. from Cambridge, and shortly afterwards the same honour from Oxford. With the money which his success enabled him to realize, he

bought estates in Kent and Surrey, and would in all likelihood have ended his days happily, had he not taken part in the civil wars as a partizan of the king. By the parliament he was taken prisoner and consigned to captivity, first in Newgate and afterwards in Ely House. He died in 1647. His works consist chiefly of annotated editions of *Juvenal* and *Persius*, *Seneca* and *Virgil*. His edition of *Terence*, left unfinished, was completed and published after his death by Dr Merie Casaubon. His other works, such as his *Systema Grammaticum*, are chiefly philological, and have been long superseded.

FARNESE PALACE. See ARCHITECTURE, vol. iii., p. 452.

FARNHAM, a market-town of England, county of Surrey, near the left bank of the Wey, 10 miles W.S.W. of Guildford, and 38 miles from London. Pop. (1851) 3515. The town is built on the S. slope of a hill rising about 700 feet above the level of the sea, and consists principally of two main streets, with a market-place at their intersection. It is well supplied with water from springs in the neighbouring hills, conveyed by pipes to a large reservoir in the town. The parish church is a spacious edifice in the later Gothic style, and was formerly a chapel of ease to Waverley Abbey (founded in 1128), of which some remains still exist in the vicinity. Farnham was early a place of importance, and sent two members to parliament from 4th Edward II. to 38th Henry VI. Farnham Castle on a hill N. of the town, and now the seat of the Bishop of Winchester, was first built by Henry de Blois, Bishop of Winchester, and Brother of King Stephen; but it was razed by Henry III. It was rebuilt and garrisoned for Charles I. by Denham, from whom it was taken in 1642 by Sir W. Waller; and having been dismantled, was restored by Dr Morley, Bishop of Winchester. Farnham was formerly noted for its cloth manufacture, which is now quite extinct. It is chiefly celebrated for hops of a very superior quality, extensively cultivated in the vicinity. Market-day, Thursday. Cobbet was born in the parish of Farnham in 1762, and his remains are interred near the main entrance of the church.

FARNOVIANS, an heretical offshoot from the Socinians, which under the conduct of Stanislaus Farnowski (in Lat. *Farnovius* or *Farnesius*) separated from the other Unitarians in 1568, and attracted within its pale many men eminent for piety, learning, and ability. This schism took place on account of an opinion maintained by Farnovius, that before the foundation of the world Christ was either begotten or produced out of nothing by the supreme God. Farnovius also forbade his followers to pray to the Holy Ghost. These are the only points of the peculiar doctrines of this sect of which we have any knowledge. The Socinians used every effort to draw it back within their pale, and succeeded so well, that on the death of Farnovius in 1615 the sect became utterly extinct.

FARO, a city and seaport of Portugal, province of Algarve, situated on the Valfermosa, near its mouth, 20 miles W. by S. of Tavira. It is surrounded by walls, and contains a cathedral, military hospital, custom-house, arsenal, and several convents and charitable establishments. The harbour is small, but it has a good roadstead. The exports are figs, raisins, almonds, dates, oranges, lemons, wines, cork, sumach, baskets, and anchovies. Pop. about 8000, many of whom are fishermen.

FARO, *Cape*, the ancient *Pelorus*, the N.E. point of the island of Sicily, and one of the three promontories which give a triangular figure to that island. It is situated at the narrowest part of the Strait of Messina, which is thence sometimes called the Faro Channel. The light-house (*faro*) on Faro Cape is in N. Lat. 38. 15. 50., E. Long. 19. 16.

FARO, a game played with cards; one of the most common and simple of all games of hazard.

FAROE, or FEROE (Danish *Färöerne*), a group of islands belonging to Denmark, in the North Sea, between Iceland and the Shetland islands, about 200 miles N.W. of the latter: between N. Lat. 61. 20. and 62. 25., and between W. Long. 6. 16. and 7. 40. The group consists of seventeen inhabited and several uninhabited islands, the former having an area of 490 square miles, and (in 1850) 8150 inhabitants. The principal islands with their populations in 1845 were Strömö 2162, Osterö 1909, Süderö 1156, Vaagö 649, Sandö 528, and Bordö 304. They consist throughout of rocks and hills, rising to a considerable height, and separated from each other by narrow valleys, or rather ravines. Although, however, these hills rise abruptly, there are often on their summits, or at different stages of their ascent, plains of considerable magnitude. They everywhere present to the sea perpendicular cliffs, broken into a thousand fantastic forms, presenting to those who sail along the coast, at every turn, the most picturesque and varied scenery. The highest peak is that of Skellingfell, in the island of Strömö, which rises to about 3000 feet above the sea. The rocks consist generally of trap, and exhibit little variety of composition, though they present some striking geological phenomena. The zeolites and chalcedonies here collected have long supplied the best specimens of these minerals to the cabinets of Europe. Coal is found in Süderö and some of the other islands, and turf is abundant.

The climate is moist and foggy, and violent storms are frequent at all seasons. July and August are the only summer months, but the winters are not very severe. It seldom freezes for more than one month, and the harbours are rarely ice-bound. The only grain crop is barley; and on account of the uncertainty of the weather, it is frequently reaped in a half ripe condition. Agriculture is in a very backward state, the infield, or cultivated land, being calculated to be to the outfield, or uncultivated, in the proportion of one to sixty. The plough is seldom used, being in fact ill suited to the rugged and uneven surface of the land. The ground is therefore turned up with the spade, care being taken not to destroy the roots of the grass. Horses and cows are few in number, and the latter give very little milk, in consequence probably of the very coarse hay upon which they are fed. Sheep are numerous, and form the chief riches of the islanders; some individuals having flocks of from three to five hundred. The sheep are never housed either in summer or winter, and in severe seasons they suffer considerably. The wool is generally coarse, and is torn off the animals in so rough a manner as often to lacerate the skin. The catching of the numerous birds which build their nests upon the face of the cliffs, forms a great source of subsistence to the inhabitants. The persons employed in this hazardous trade display great ingenuity and the most adventurous spirit. Sometimes the fowler is let down from the top of the cliff by a rope fastened to his waist; at other times, where there is any footing at all, he climbs the steepest rocks, or, where that is impossible, he is pushed upwards by poles made for the purpose. The puffin (*Alca arctica*) is the most common of these birds, and the eider duck is here often shot for food. The fisheries are important and valuable.

The monopoly of the trade of the Faroe Islands was for some time in the hands of a mercantile house at Copenhagen; but it has now been assumed by government, and neither Dane nor foreigner is allowed to interfere. The trade is carried on between Copenhagen and Thorshavn. The chief exports are hosiery, tallow, dried and salt fish, train-oil, feathers, skins, and butter.

Thorshavn, the capital of these islands, is situated on the S.E. side of the island of Strömö, upon a narrow tongue of land, having creeks on each side, where ships may be safely moored. Pop. about 1500. The houses are built of wood, and roofed with birch bark covered with turf, the greenness

Farquhar.

of which makes it impossible at a very short distance to distinguish the place from the surrounding fields. The character of the people is generally marked by great simplicity of manners, kindness, and hospitality. They are well fed and clothed, and seem to be kindly treated by the Danish government. The average duration of life, as stated by Dr Panum, is 44⅝ years; while in Denmark it is only 36. The language of the people is a remnant of the old Norse, but that of the courts, churches, and schools, is the modern Danish. See *Færoæ and Færoæ Reserata*, by Lucas Jacobson Debes, translated from the Danish into English, 1675; *Description of the Faroe Islands*, by the Rev. G. Landt, London, 1810: an account of their geology and mineralogy in the Trans. of the Royal Soc., Edin., vol. vii., by Sir G. S. Mackenzie, Bart., and Thomas Allan Esq.; Den Danske Stats Statistik., vol. iv., 1853: J. Nichol's *Account of Iceland, Greenland, and the Feroe Isles:* Dr Panum's *Official Report on the Diseases of Feroe*, 1849, of which an abstract appeared in vol. vii. of the *Medico-chirurgical Review*. The scenery of these islands is well illustrated in a work entitled *Cruises of the Yacht Maria*. Lond. 1855.

FARQUHAR, George, a comic dramatist of the school of Wycherley and Congreve, was a native of Ireland, the son of a clergyman in Londonderry, and born in the year 1678. He early rose into distinction, and his brief successful career was closed before he was thirty. In his sixteenth year he was entered of Trinity College, Dublin; in his seventeenth he was an actor on the Dublin stage; in his eighteenth he had quitted the theatrical profession and was in London; and in his twentieth year his first play, *Love and a Bottle*, was brought out with applause at Drury Lane. His connection with the stage as an actor was suddenly terminated in consequence of an accident. While performing in Dryden's *Indian Emperor*, he had omitted to exchange his sword for a foil, and in a fencing scene seriously wounded a brother actor. The latter recovered, but the young and sensitive author of the misfortune resolved to leave the stage for ever. In less than nine years Farquhar had produced seven popular comedies,—his *Love and a Bottle; The Constant Couple, or a Trip to the Jubilee; Sir Harry Wildair*, a sequel to *The Constant Couple; The Inconstant, or the Way to Win Him; The Twin Rivals; The Recruiting Officer;* and *The Beaux Stratagem*. He also published (1702) a volume of *Miscellanies*, consisting of short poems, letters, and essays, with a *Discourse upon Comedy*, in which he defends the English disregard of the dramatic unities. The poems and letters are in that style of affected licentious gallantry and smartness which was then thought witty and fashionable. They have no redeeming feature. The letters are said to have been addressed to Mrs Oldfield, the celebrated actress whom Pope, in his imitation of the second satire of the first book of Horace, happily characterizes, as—

> Engaging Oldfield! who, with grace and ease,
> Could join the arts to ruin and to please.

The stage at this time was but slightly purified from the grossness and immorality that had overflowed the theatres like a spring-tide flood at the period of the Restoration; and neither the lives nor the writings of dramatic authors or performers will bear a close scrutiny. Farquhar is less designedly and elaborately immoral than Wycherley or Congreve, yet there are few of his scenes that do not require pruning or excision. Love intrigues then formed the chief business of the comic drama; and in the management of them, the homely domestic virtues that are the happiness and cement of society were totally disregarded, or made the subject of ridicule. Seriousness was synonymous with hypocrisy, and the gaieties of a town life were held up as the end and aim of existence. It is true that the world of comedy was an artificial world,—never, perhaps, regarded as real, or as a pattern of morals or manners; but the effect of such representations was to lower and corrupt the national taste and principles, while the fact that no pursuit was so profitable to an author as writing for the stage was also injurious to our imaginative literature. Considering the standard of taste and morals at the time Farquhar wrote, and for half a century afterwards, of which the *Suffolk Correspondence*, *Lord Hervey's Memoirs of the Court*, and other works, afford ample evidence, we need not wonder at the success of his plays. His plots are skilfully conducted and evolved, his situations well chosen, and his dialogue full of life and spirit. Goldsmith preferred Farquhar to Congreve, while Pope considered him a mere farce writer. The truth lies between the two. Congreve was the more polished and consummate artist,—his wit is brilliant and cutting as a diamond. Farquhar is easy, natural, and lively,—overflowing as it were with animal spirits and robust health. In the delineation of character he is eminently happy. His Sergeant Kite, Scrub, Archer, and Boniface, are distinct, pronounced characters, that still charm from their freshness and originality; while the incidents with which they are mixed up—the unexpected encounters, artifices, and disguises—are irresistibly comic and effective on the stage. The personal history of Farquhar is that of a careless dissipated "man upon town." He received from the Earl of Orrery a commission as lieutenant in his lordship's regiment, and is said to have given proof of conduct and courage as a soldier. In what service he was employed is not stated, but he could not have had any arduous military duty. The stage, not the tented field, was his scene of action. He appears, however, to have been in Holland in 1700, as one of his letters is dated from the Brill and another from Leyden. He took pains to conciliate patrons by flattering dedications prefixed to his plays, and he attempted to better his fortunes by marriage. Some lady, we are told, conceived a violent passion for him, and circulated a report that she had a large fortune. Farquhar fell into the snare, he married the lady, and found out too late his mistake; but he had the magnanimity, it is said, to pardon a deception that must have appeared a compliment to his genius. There was, however, something to forgive on his own part for snatching so readily at the gilded bait, contrary to all the rules of love and the drama. He was always in difficulties. He was forced to sell his commission; and after finishing his last and best play, *The Beaux Stratagem*, in six weeks, while death was impending over him, he left his two children to the care of Wilks the actor. "Dear Bob," he said in a farewell epistle, "I have not anything to leave thee to perpetuate my memory, but two helpless girls; look upon them sometimes, and think of him that was to the last moment of his life thine, George Farquhar." Wilks did not forget the melancholy request, but he probably had little to give. One daughter became a servant, and the other married a "low tradesman," while the mother lived and died in the utmost poverty. Thus the life of Farquhar, spent as a jest, became in the end a sad and instructive reality. He died in London, and the parish register of St Martin's-in-the-Fields obscurely records his burial in this fashion,—"23 *May*, 1707. *George Falkwere*." (R. C—S.)

Farrier ‖ Farringdon, Great.

FARRIER (from the Lat. *ferrum*, iron; whence in some old authors written *ferrier* and *ferrer*); one who shoes horses, or one whose business it is to cure horses and other animals when diseased or lame. The medical and surgical treatment of the domestic animals constitutes what is termed the veterinary art.

FARRIERY. See Veterinary Science.

FARRINGDON, Great, a market-town of Berkshire, situated at the foot of Farringdon Hill, about 2 miles from the Thames, 30 W.N.W. of Reading, and 68 from London. Pop. (1851) 2456. The town is neat, clean, lighted with gas, and well supplied with water from the spring of Port-

well. The streets diverge from the centre of the town, where the town-hall is situated. The parish church is an interesting Gothic structure of different periods, the E. end being of great antiquity. Market-day, Tuesday. Farringdon carries on an extensive trade in corn and bacon.

FARS, or Farsistan, a province in the S.W. of Persia, bounded on the N. by Irak and Khorassan, E. by Kirman, S.E. by Laristan, S.W. and W. by the Persian Gulf, and N.W. by Khuzistan. It lies between Lat. 27. 40. and 31. 52. N., and between Long. 49. 30. and 55. 20. E. This province is divided into the Germaseer and Sirhud, or the warm and the cold climates. It is in general sandy and barren, though with some considerable exceptions. The Tabris, formed by the junction (within a few miles of the town of Zeitoon) of two streams which take their rise in the mountains of Fars, is the most considerable river of the province. It divides Fars from Khuzistan, and falls into the sea eight miles below the town of Endian. The warm region of this district extends from the sea to the latitude of Kazeroon, and runs parallel with the gulf from the banks of the Tabris to the confines of Laristan. It is chiefly a sandy plain at the foot of the mountains, the cultivation of which depends on the periodical rains; and when these prove abundant, the country yields abundance of dry grain; but when the rains fail, which too frequently happens, a famine generally ensues. The sandy plain, or the Dushtistan as it is called, is divided into two districts, which are separated by the projecting mountain of Bung. These two districts are thinly peopled and badly cultivated; and the few mud villages which are scattered over the plain bespeak but too clearly the poverty and wretchedness of their possessors. The cold region comprehends most of the mountainous part of Fars, extending from the latitude of Kazeroon to that of the town of Yezdekhast, situated on the bed of what appears to have been formerly a river, and which separates this province from Irak. The mountains are here intersected by plains, which seldom exceed eight or ten miles in breadth, whilst in length they vary from fifteen to a hundred. They are in general fertile, affording abundance of pasturage; nor are they so deficient in water as they have sometimes been represented. A few of them, such as those of Shirauz, Kazeroon, and Merdesht, are tolerably well cultivated; but they are for the most part, particularly to the northward and westward, destitute of inhabitants. It is mentioned by Kinneir, in his Geographical Memoir of the Persian Empire, that in 1809 he travelled in this country "through the most delightful valleys, covered with wood and verdure," but all was solitary, nor was the face of a human being anywhere to be seen. The face of the country in the eastern parts of Fars is somewhat different, being open, the plains of greater extent, and of a sandy soil, where water is not so plentiful. The great range of mountains seen from the coast is a mere elongation of the chain of Mount Tagros, which extends in a continued succession of ridges from the borders of the Persian Gulf to the Caspian Sea and the Caucasus. These hills in Fars are situated at different distances from the sea. At Bushire they are distant 24 miles; but towards Bunder Reig the plain becomes contracted; and a low ridge, known by the name of Kohi-Bung, or the hill of Bung, about seven or eight miles broad, suddenly projects to the south, and touching the sea, separates the district of Leerawee from that of Hiadouat. Beyond this hill, at the plain of Leerawee, the mountains are about 20 miles distant from the sea, at which distance they continue for 18 or 19 miles, when they again approach the south. This branch is known by the name of Zeitoon, on turning the southern point of which they again abruptly retire to the northward; and at the port of Mashoor they are 30 miles from the sea. The principal towns of the province are Shiraz, the capital; Bushire, the chief port in the Persian Gulf; Darabjerb, Bebahan, and some others. Within its confines also are the ruins of the cities of Shakpoor, Persaga, and Persepolis.

FARTASH, or Fartak, a cape on the S. coast of Arabia, province of Hadhramaut; Lat. 15. 36. 40. N., Long. 52. 21. 10. E.

FARTHING, a small English copper coin, amounting to one-fourth of a penny. It was anciently called *fourthing*, as being the fourth of the integer or penny. A farthing of gold, equal in value to the fourth part of a noble or 20d. in silver, is mentioned in statute 9th Henry V., cap. 7.

FARTHINGALE, a petticoat extended by hoops or circles of whalebone; and first worn, it it said, by pregnant women. The fashion was introduced into England in the reign of Queen Elizabeth; and the last remnant of it, namely the single hoop, only disappeared about the year 1820.

FASCES, in *Roman Antiquity*, a symbol of authority introduced by the kings, consisting of a bundle of rods, usually of birch, tied together, and containing an axe, the head of which was allowed to project. Officers named *lictores* were appointed to carry the fasces, and varied in number according to the dignity and importance of the magistrate whom it was their duty to precede. In the regal times of Rome, 12 of these officers, each carrying the fasces, preceded the king whenever he walked abroad. After the expulsion of the Tarquins the consuls were allowed 12 lictors each, but the axes were only borne before one of them at a time. Publicola got a law passed according to which only one of the consuls was allowed the fasces when both these magistrates were in the city at the same time. The other was attended by a single officer, named *accensus*. It was also ordained that the axes should be removed from the fasces, unless when the consul was in the camp. The dictator, however, was preceded by 24 lictors, and even in the city was allowed to retain the axes. The prætors were each allowed two when in the city, but when on military service the number was increased to six. The tribunes of the people, ædiles, and quæstors, were not allowed lictors in the city; but the quæstors might have them in the provinces.

FASCIA, among the ancient Romans, denoted a band, sash, or long piece of cloth, used to wrap about the legs and thighs; to swathe new-born infants; or for any similar purpose. In astronomy the term *fascia* is applied to the belt of a planet; and in architecture to any flat member with a little projection, as the band of an architrave. (See *Glossary* to Architecture.)

FASCINATION, a sort of witchcraft or enchantment supposed to operate either by the eye or the tongue. Among the ancient Greeks and Romans it was a prevalent belief that some persons had the power of injuring others, particularly children, and even cattle, by their looks; and various amulets were employed to avert the imaginary evil. See Evil Eye.

FASCINES (*fascis*, a bundle), in *Fortification*, faggots, or bundles of rods, or small branches of trees, bound together in several places. They are used for various purposes, such as raising batteries, filling ditches, forming parapets, &c.; and vary in dimensions according to the purposes to which they are to be applied. Fascines dipped in pitch are sometimes employed to fire the enemy's lodgements or other works.

FASHION. It was the ordinary remark of the fashionable Doctor Graham (in the days of Horace Walpole), when consulted by a patient—"Sir, your disease is very extraordinary, but it is common enough." This paradoxical definition may be very well applied as interpreting the word "Fashion." The latter is doubtless an extraordinary thing commonly adopted. It will seem still further paradoxical to assert that what is "fashionable" is "vulgar"; but when it is recollected that "vulgar" implies something popularly observed (the word being derived from "volk," "*people*"), the paradox is no longer apparent. The Latin

terms *vulgus* and *vulgaris*, like our own translations of them, are not intended to convey anything complimentary in them. The designation *vulgus* was contemptuously flung at the ancient Germans by their Roman antagonists. The sons of Herman accepted the name, and the German "volk" soon became the fashionable or popular equivalent for "patriots."

In the term "mode" we have something of a similar meaning. It is derived from *mos*, a manner or custom. This word in its plural form, *mores*, signifies "morals," by which is meant manners, which, if not, ought to be, in fashion. As in Latin the difference of number alters the signification, so in French does the change of gender. "Le moral," of a woman, is, for instance, by no means the same thing as "sa morale." In deriving *mode* from "mos," we follow the lexicographer Boiste. We may add, however, that another Latin word, "modus," is not altogether to be set aside as the original of "mode." It implies a due proportion, neither more nor less; a just measure or manner; and to be in the mode, according to this rendering of the original, is not to be extravagant, not to be in excess in anything. He who adopts *this* mode will find himself possessed of the most valuable of fashions—the true "*factio nobilium*;" although Livy had not the same application in his mind when he wrote the words just quoted.

The most ancient fashion with which we are acquainted is one which is just expiring. It commenced in Scythia, and is going out, after a long reign, in New Zealand. We allude to "tatooing." It is, or was, the offspring of some strange conceit on the part of the ladies. These latter were Scythians, who, holding in their power some Thracians of the same sex, amused themselves, says Clearchus, by tracing very ridiculous figures on their bodies, by means of needles. The poor Thracian ladies, when restored to freedom, exercised their ingenuity by concealing the absurd figures etched on their bodies, in a labyrinth of flourishes, circles, and most perplexing patterns. The design was immediately adopted as fashionable wear, and every Thracian lady appeared in public tatooed from the head to the loins. Since that period, the mode has been followed by various nations, and until very recently it was the characteristic of the New Zealand aristocracy. Of late years, however, the young chiefs look with something of contempt on their seniors so distinguished; and very speedily a tatooed skin will be as rare a thing in the isles of the Southern Ocean as perukes and patches, clouded canes and farthingales, in the public promenades of England.

The fashions of the conqueror generally prevail over those of the conquered. Thus young British chieftains, despite the disgust of their sires, threw off their vesture of skins and put on the habits of their Roman victors. A consequence, only partially similar, followed the Norman invasion; the Norman cavaliers took from the Saxons their "smock-frocks," and with a change of material and an addition of ornament introduced the *blouse*. When not engaged in military duties, the same invaders doffed their iron head-pieces, and donned a wide-brimmed and easy covering of felt;—this was nothing more than the modern "wide-awake." The *couvre-chef* of the lounging Norman has been stiffened into the peculiar head-gear of the Society of Friends; but its chief glory consists in its having been in a modified shape and a scarlet hue patronized by the Church of Rome, and fixed upon the brows of her humble cardinals.

Some one has defined "fashion" as being "the tyrant of fops and females." The definer might have added that the artificers in fashion's service are often the victims of fashion's slaves. There is nothing so powerful, so absolute, so imperious, and so transitory, as this same fashion. Napoleon himself was jealous even of this so-called goddess; and he condescended to sneer at her votaries, by saying that nations are sheep-like, and ready to follow the first who sets a strange example. The simile is ricketty, and is not entirely correct. We have never heard of any one who followed the fashion set and advocated by Asclepiades, who tried to bring cheap locomotion into general favour, and who travelled about the world on a cow, living on her milk by the way.

The above is an example set, which has never been followed. We may cite on the other hand a fashion followed, the originating example for which no one has yet discovered. We allude to "smoking." Of course, at this word, the thoughts naturally revert to Sir Walter Raleigh and Virginian tobacco. There were pipes, however, in our old monasteries, and the monks smoked "colt's-foot" to keep the marsh air out of their stomachs. The fashion is probably of Eastern origin. That mention is not made thereof throughout the *Arabian Nights* is no proof to the contrary, for we believe that in that picturesque series the undeniably prevalent Eastern fashion of opium-eating is not even alluded to.

Fashion, in its sense of the way of doing a thing, is not confined to matters of dress alone. It extends itself to far sublimer subjects, rules our manner of life, gives opinions to those who have none of their own, and is sometimes powerful even in *articulo mortis*. As a sample of the last, it is only necessary to name the case of Father Sachot, the priest of St Gervais. In the middle of the seventeenth century he was the fashionable confessor at death-beds. Happy was the moribund who could secure the pleasant presence of the not too exacting Father Sachot. On the other hand, the patients on whom he could not wait, and who were unable to receive absolution at his hands, were miserable, and obstinately refused to die with solemn aid from any other hand. Men "of quality"—as it was, and is, the bad fashion to call a certain class of persons, without reference to the question of good or evil quality—men of quality thought more of Father Sachot than of their heavenly Father.

A similar mistake possessed those who in our great grandsires' days flung away their thousands upon a flower. The Egyptians worshipped onions, for the semi-reasonable cause that they symbolized a god. The tulip-fanciers had little regard, when contemplating their petalled favourites, for either flowers themselves or the god at whose bidding they had risen into beauty. As La Bruyère remarks, they simply worshipped their tulip-bulbs, and would have adored carnations if carnations had been more in fashion.

As in flowers, so have we had a fashion in colours. The "couleur Isabelle" was a dirty buff. It was adopted in honourable memory of the condition of the linen of Isabelle, the *gouvernante* of Flanders, who refused to change any portion of her dress during the long protracted siege of Ostend. The "patches" on the cheeks of the belles of a century and a half ago were assumed in order to give consolation to a princess suffering from a natural eruption. There was more sense in the fashion of patches as adopted by the lightly-clad ladies of the Samoa Island. This "fashion of spots," as it is called, or *sangisengi*, consists in the raising of small blisters with a smouldering wick of native cloth, a material which will not blaze. When the blisters are healed, a natural patch is left, which is lighter than the original skin. This indelible spot is planted on the cheek, not for beauty's sake, but with something of the purpose which supplies our churches with painted windows; namely, in pious memory of deceased relatives, or in grateful acknowledgment of benefits received.

This religious fashion reminds us that the Scriptures contain no notice whatever of the vocation of a tailor. The meek members of the useful craft need not, however, be discouraged. Lydia of Thyatira followed the occupation of

Fashion. making up into garments the purple cloth for which the country named Lydia was famous; and Lydia stands enviably recorded as being among the first who joined Paul in prayer by the river side at Philippi. One would have supposed that the great apostle would have been selected by the fashioners of costume as their patron-saint. This, however, is not the case. The milliners and dressmakers before the Reformation did homage to a visionary "St Veronica," and the tailors in olden times put up their orisons to the united nine St Williams who stand upon the calendar of Rome.

The most pious of men, it may be observed, were not above some regard for fashion, even with reference to very small matters. Thus, in the days of Elizabeth and James no Puritan divine ever went to bed but with his head in a night-cap of black silk tipped with white. Under the same sovereigns, doctors of medicine and privy-councillors sank to sleep in night-caps wrought with gold silk. Similar head-gear was worn by our princes. At the marriage of Frederick Prince of Wales, the ill-conditioned son of the worse-conditioned George II., the royal bridegroom was splendid at night in his robe of gold tissue and a night-cap wrought with gold silk. Thus attired, he glided among the crowd of fashionable people who stood in the bed-room to greet the illustrious pair; and with this marriage went out the unseemly fashion of such public greetings.

We have before alluded to the long prevalence of some fashions. We are inclined to think that the excessive growth of the nails, as indications of rank (the wearers of them being necessarily above manual labour), a fashion not confined to China, but followed also in Upper Nubia, where the growth is encouraged by holding the nails over small fires of cedar wood; we are inclined, we say, to think that such fashion, if it does not date from the time of Adam, prevails in the localities named, only because of him. There is, at all events, a Rabbinical tradition which says, that before the fall, Adam and Eve had a transparent covering, a robe of light, of which remnants remain to mankind in the nails of the hands and feet. To encourage the growth of the nail was, probably, in its original sense, only to recover as much as possible of the robe of light which decked the forms of the parents of mankind. Did the old British astronomers wear green robes with any reference to the older legend in the East, that the original colour of the father and mother of men was a sea-green? That colour is said to have been sacred in the East long before the time in which the Prophet of Islam adopted it as the holy hue, which none might thenceforth wear save the members of his own family; and the fashion may have been adopted by the father of the faithful in remembrance of its traditionary connection with the father of us all. The green, for dress, whether as assumed by British astronomer or prophet from Yemen, was in better taste than a mode of our Saxon ladies who, before the Norman invasion, thought they heightened their beauty by dying their hair *blue!* They seldom, however, changed the fashion of their garments according to the variation of the seasons. The summers then, as now, seldom came to maturity, and it was this fact which induced Boerhaave to prescribe the old Saxon custom as a good sanitary fashion. "In England," said Boerhaave, "a man should never lay aside his winter costume until Midsummer-day, and he should put it on again the day after." If this fashion, with some necessary modification, were adopted, one happy consequence would undoubtedly follow; phthisis would not be the fashionable, or rather national malady of England. Madame Cottin, in her *Mathilde*, says that modesty is the most seductive of garments. The assertion is one made in the fashion of the good ladies of the last century, who thought themselves moralists. They all err in their mode of giving a meretricious recommendation to modesty; and the too-joyous Irish bard was not much more sillily employed, when he anathematized flannel and sought to give *éclât* to the ague.

Fast.

Perhaps it was an abhorrence of the latter that brought into fashion the foot-races that in the last century used to be run on Sunday afternoons in Kensington Gardens by the "Maccaronis." There was nothing, for a time, more decidedly in vogue than these profane sports. The mob looked on, applauded and despised the performers. Of all our sporting fashions it was perhaps the one most disgraceful to us. We may add while on this subject, that although cricket as a Sunday sport has gone out of fashion, it is still a game which may be legally played on the day named, provided that all the players be of the same parish. The intention, no doubt, was to prevent "matches" on the Sabbath. The regulation, as showing the fashion of the times, is worth mentioning.

Finally, reverting to "fashion" as simply in connection with dress, its past history reveals to us the counterfeit presentment of our ancestors; its present history, to be found in various contemporary authors, will convey a reflection of ourselves to those who will succeed us. It is a subject which unceasingly occupies the fool, and only passingly concerns the philosopher. Diogenes was not anything the more of a philosopher for living in a tub. He affected to fly the fashions of his day; but it has been truly remarked that while a fop is the slave of fashion, a philosopher surrenders himself to his tailor, whose duty lies in dressing him becomingly. He who entirely despises becomingness of attire, under an affected or an imaginary contempt for fashion, is as weak of head and mistaken in employment as he who sets all duties below the pleasure of watching the fashions and adopting them. These perish with daily perishing time, and as the moralist of Dourdan sensibly remarks:—"La vertu seule, si peu à la mode, va au-delà des temps." (J. D—R—N.)

FAST, properly signifies abstinence from food; and in a theological sense is used to denote voluntary abstinence from food, or particular kinds of food, as a religious mortification or humiliation. Religious fasting has been practised by most nations from the remotest antiquity; and some divines would even refer its origin to the command by which our first parents were forbidden to eat of the tree of knowledge. It is, however, certain that the Jewish church has observed fasts ever since its first institution. Nor were the neighbouring nations, the Egyptians, Phœnicians, and Assyrians, without their fasts. The Egyptians, according to Herodotus, sacrificed a cow to Isis, after having prepared themselves by fasting and prayer; a custom which he likewise ascribes to the women of Cyrene. Porphyry affirms that the Egyptians, before their stated sacrifices, always rested a number of days, sometimes even of weeks; and that during this time the priests and devotees not only abstained from flesh, fish, wine, and oil, but even from bread, and some kinds of pulse. These austerities were communicated by them to the Greeks, who observed their fasts much in the same manner. The Athenians had the Eleusinian and Thesmophorian fasts, the observance of which was very rigorous, especially among the women, who spent one whole day sitting on the ground in a dress of mourning, without taking any nourishment. In the island of Crete the priests of Jupiter were obliged to abstain during their whole lives from fish, flesh, and baked meats. Apuleius relates, that whoever desired to be initiated in the mysteries of Cybele was obliged to prepare himself by fasting ten days; and indeed, with respect to all the pagan deities, this duty was required of those who desired to be initiated into their mysteries, of the priests and priestesses who gave out the oracles, and of those who came to consult them. Amongst the heathens fasting was also practised before some of their military enterprises. Aristotle relates that the Lacedæmonians, having resolved to succour a city of the allies, ordained a fast throughout the whole extent of

their dominions, without excepting even the domestic animals; and this they did for two ends, first, to spare provisions in favour of the besieged, and, secondly, to draw down the blessing of heaven upon their enterprise. The inhabitants of Tarentum, when besieged by the Romans, demanded succours from their neighbours of Rhegium, who immediately commanded a fast throughout their whole territories. Their enterprise having proved successful by throwing a supply of provisions into the town, the Romans were obliged to raise the siege; and the Tarentines, in memory of this deliverance, instituted a fast to be annually observed ever afterwards.

Fasting was practised at Rome both by kings and emperors. Numa Pompilius, Julius Cæsar, Augustus, Vespasian, and others, we are told, observed stated fasts; and Julian the Apostate was so exact in this observance as to outdo the priests themselves, and even the most rigid philosophers. The Pythagoreans kept a continual lent; but with this difference, that they believed the use of fish to be equally unlawful with that of flesh. Besides their constant temperance, they also frequently fasted rigidly for a considerable time. In this respect, however, they were all outdone by their master Pythagoras, who was said to fast for no less than fifty days together! Even Apollonius Tyaneus, one of his most celebrated disciples, could never equal his master in the length of his fasts, though in these he greatly exceeded other Pythagoreans. The Gymnosophists, or Brahmins of the East, are also remarkable for their severe fastings; and the Chinese have likewise their stated fasts, with forms of prayer, for preserving them from barrenness, inundations, earthquakes, and other calamities. The Mohammedans too, who possess so large a part of Asia, are remarkable for the strict observance of fasts; and the exactness of their dervises in this respect is extraordinary. (See Mohammedanism.)

Fasting was often used by the heathens for superstitious purposes; as to procure the interpretation of dreams, &c. The Jews have added several fasts not commanded in the law of Moses, particularly three, in memory of great national calamities. The sole fast required by Moses was on the great day of annual atonement. The abstinence of the ancient Jews commonly lasted twenty-seven or twenty-eight hours at a time, beginning before sunset, and not ending till some hours after sunset the next day. On these days they covered themselves with sackcloth, sprinkled ashes on their heads, and performed other like ceremonies. The ancients, both Jews and pagans, had also their fasts for purifying the body, particularly the priests and such as were employed at the altars; and at great festivals it was usual for them, on the preceding eve, not only to abstain from food but also from sleep.

With regard to this observance among Christians, as fasts are nowhere expressly enjoined by our Saviour, and as his disciples, while he was with them, were notorious for not fasting, some have contended that such observances are not required from his followers. They explain the passage (Matth. ix. 15) where Christ says that the days will come when his disciples shall fast, as merely intimating the approach of a period of mourning, and signifying rather sorrow of mind than corporeal self-denial. The apostles and early Christians, however, are frequently represented as fasting, especially on solemn occasions; as when Paul and Barnabas are sent forth by the apostles to preach to the Gentiles (Acts xiii. 2). Our Saviour too, in reprobating its abuses among the Pharisees, never objects to its legitimate use (Matth. vi. 17). Though fasting cannot in itself be looked upon as a meritorious work, yet there seems to be little doubt that its occasional use is beneficial, as tending to induce a frame of mind that is favourable to meditation and devotion. (See also Abstinence.)

FASTERN'S EVE, in Scotland, the name given in the times of popery to Shrove-Tuesday, or the day immediately preceding Ash-Wednesday. The name is still retained.

FASTI, in *Roman Antiquity*, the kalendar in which were comprised the various days of the year, with their feasts, games, and other ceremonies.

There were two kinds of *fasti*, the greater and less; the former distinguished by the appellation of *fasti magistrales*, and the latter by that of *fasti kalendares*. The *fasti kalendares*, which were properly and primarily called *fasti*, are defined by Festus Pompeius to be books containing a description of the whole year, that is, ephemerides or diaries, in which the several kinds of days—*festi, profesti, fasti, nefasti*—are distinguished. The author of these was Numa, who committed the care and direction of the *fasti* to the *pontifex maximus*, by whose advice the people were guided on these points. This custom continued until the year of Rome 450, when C. Flavius, secretary to the pontifices, exposed in the forum a list of all the days on which it was lawful to work; and this proved so acceptable to the people that they made him curule ædile. The *fasti kalendares* were of two kinds, namely, *urbani* and *rustici*. The *fasti urbani* were those which obtained or were observed in the city. Some are of opinion that they were thus called because they were exposed publicly in different parts of the city; though from the various inscriptions it may be conjectured that private persons had likewise *fasti* in their houses. Ovid undertook to illustrate these *fasti urbani*, and comment on them, in his *Libri Fastorum*, of which only the first six books are extant. In the *fasti rustici*, or country *fasti*, were expressed the several days, feasts, and the like, to be observed by the country people. For as the latter were occupied in tilling the ground, fewer feasts, sacrifices, ceremonies, and holidays were enjoined on them than on the inhabitants of cities; and they had also some peculiar ones not observed at Rome. These rustic *fasti* contained little more than the ceremonies of the kalends, nones, and ides; the fairs, signs of the zodiac, increase and decrease of the days, the tutelary gods of each month, and certain directions for rustic labours to be performed each month. In the great fasti, or *fasti magistrales*, were expressed the several feasts, with everything relating to the gods, religion, and the magistrates; the emperors, their birthdays, offices, days consecrated to them, with feasts and ceremonies established in their honour, or for their prosperity. When flattery had at length swelled the *fasti* with a number of such circumstances, they came to be denominated *magni*, in order to distinguish them from the bare kalendar, or *fasti kalendares*.

Fasti was also a chronicle or register of time, in which the several years were denoted by the respective consuls, with the principal events which happened during their consulates. This register was denominated *fasti consulares*, or the consular *fasti*.

Fasti, or *Dies Fasti*, likewise denoted court days. The word *fasti fastorum* is formed from the verb *fari* to speak, because during those days the courts were opened, causes might be heard, and the prætor was allowed *fari*, to pronounce the three words, *do, dico, addico*. The days in which this was prohibited were called *nefasti*. Hence Ovid says,

> Ille ne fastus erit, per quem tria verba silentur,
> Fastus erit, per quem lege licebit agi.

The *dies fasti* were noted in the kalendar by the letter *F*; but it is to be observed that there were some days *ex parte fasti*, partly *fasti*, partly *nefasti*, in which justice might be distributed at certain times of the day, and not at others. These days were called *intercisi*, and were marked in the kalendar by the letters *F. P. fasto primo*, in which justice might be demanded during the first part of that day.

FASTOLFF, Sir John, a distinguished English officer, born at Yarmouth in Norfolk in 1377. He held many places of trust and importance in Ireland, and afterwards in France. For his bravery at Agincourt, where he was wounded, he

received a grant of land in Normandy. After distinguishing himself at the siege of Orleans he fled ignominiously from the field of Patay before the victorious Joan of Arc. For this inglorious conduct he was temporarily degraded, but afterwards restored to his honours. On returning to England he signalized himself by his encouragement of literature, bestowing large sums on Cambridge, and endowing Magdalen College with special liberality. He died in 1459 at the age of eighty. It is merely a gratuitous supposition to imagine, as some writers have done, that Shakspeare had this officer in his eye in delineating the character of Sir John Falstaff. There was not the most distant resemblance between the moral, physical, or intellectual characteristics of the two men.

FAT, an oily concrete substance, contained in the cells of the adipose or cellular membrane of animal bodies. See ANATOMY, ii. 787, and CHEMISTRY.

FAT also denotes a measure of capacity, but indefinite. Thus a fat of isinglass contains from $3\frac{1}{4}$ cwt. to 4 cwt.; of yarn, from 220 to 221 bundles, &c.

FAT or VAT, a large wooden tub or vessel used in breweries and tanneries; also as a measure for malt, containing eight bushels.

FATA MORGANA (or the castles of the "fairy Morgana"), a remarkable optical illusion depending on *mirage* or unusual atmospherical refraction, which has been described by various philosophical writers and travellers as observed in the Straits of Messina, between the coasts of Sicily and Calabria. The following account of this aërial phenomenon is taken from Minasi's dissertation on the subject, published at Rome in 1773. "When the rising sun shines from that point whence its incident ray forms an angle of about 45° on the sea of Reggio, and the bright surface of the water in the bay is undisturbed either by the wind or the current,—a spectator standing upon an eminence in the city, with his back to the sun and his face to the sea, beholds in the water, as in a catoptric theatre, various multiplied objects, *i. e.* an indefinite series of pilasters, arches, castles well-delineated, regular columns, lofty towers, superb palaces with balconies and windows, extended alleys of trees, delightful plains studded with herds and flocks, multitudes of men on foot and horseback, with many other strange images, all in their natural colours and proper actions, passing rapidly in succession along the surface of the sea during the short period of time while the above-mentioned causes remain. But if, in addition to the circumstances described, the atmosphere be highly charged with vapour and dense exhalations, it then happens that in this vapour, as in a curtain extended along the channel to the height of about thirty palms, and nearly down to the sea, the same objects are beheld not only reflected from the surface of the sea but likewise in the air, though less distinct and well-defined. Lastly, if the air be slightly hazy and opaque, and at the same time dewy and adapted to form the iris, then the above-mentioned objects will appear only at the surface of the sea (as in the first case), but all vividly coloured, or fringed with red, green, blue, and other prismatic colours." It is further shown by Minasi, from observations of the coast and town of Reggio, that the images of the Fata Morgana are derived from objects on shore. He tells us that he had beheld this magnificent spectacle three times; and although his account of it and those of other writers differ considerably from each other, these variations are only such as may be attributed to different conditions of the atmosphere at the time of the respective observations. That some of these descriptions may have received a certain degree of embellishment from the imagination, is not improbable; but there is certainly no reason to impugn—as some have done—their general accuracy. It may be observed, however, that the remarks of Minasi upon the causes of the several phenomena of the Fata Morgana are more fanciful and ingenious than satisfactory. It seems that the phenomenon in question appears to depend upon the calmness of the sea, and one or more strata of superincumbent air differing in refractive and consequently in reflective power; and that the confined situation of the sea in the Straits of Messina is peculiarly favourable to the development of the exciting causes of the phenomenon. For a more particular account of the Fata Morgana, the reader is referred to *Nicholson's Journal*, vol. i. 4to, p. 225, &c. Similar in character is the mirage observed in the great sandy plains of Persia, of Asiatic Tartary, in Lower Egypt, and on the plains of Mexico, &c.

In the *Philosophical Transactions* there is an account of a very singular instance of atmospheric refraction which occurred at Hastings, when the coast of Picardy, which is between 40 and 50 miles distant from that of Sussex, appeared close to the English shore. The sailors and fishermen, in amazement, crowded to the beach, and at length began to recognize several of the French cliffs, and were able to point out places they had been accustomed to visit. From the summit of the eastern cliff the spectator at one glance could see Dungeness, Dover cliffs, and the French coast all along from Calais to St Valéry; or as some affirmed, as far to the westward as Dieppe; and by aid of the telescope elevated objects on the French coast, such as buildings and trees, were readily discerned.

FATALIST, one who maintains the doctrine that all things are subject to a predetermined fate, or that all events are the result of an inevitable necessity, and therefore cannot be influenced by any choice or effort of man. See METAPHYSICS, § *On Necessity;* PREDESTINATION; MOHAMMEDANDISM, § 1.

FATE. See METAPHYSICS, and PREDESTINATION.

FATES, in *Mythology*. See PARCÆ.

FATHEMITES, or FATIMITES, the descendants of Mohammed by his daughter Fatima.

FATHER. See PARENT.

FATHER, in *Theology*, the first person in the Trinity. *Father*, as a title of honour, is given to dignitaries of the church, superiors of convents, Popish confessors, &c.

FATHERS, the name usually given to the principal writers of the early church. Those who were contemporary with the apostles, and are supposed to have been their disciples, are called Apostolic Fathers. Their works are not numerous, and they have unfortunately come down to us in a state which renders them very little worthy of confidence. The genuineness of some of them has been justly suspected, because it is well known that writings were forged in their name for the purpose of giving authority to particular doctrines or rites; and there can be no doubt that even their genuine writings were interpolated to promote the hierarchical interest which arose in the church.

The earliest of the writings ascribed to the Apostolic Fathers is the apocryphal epistle which, in the second century, was known in the Alexandrian Church under the name of BARNABAS, the companion and fellow-labourer of the apostle Paul. The design of this epistle was to diminish the respect which the Judaizing members of the church entertained for the peculiar institutions and rites of the Mosaic economy, and to show that these were not binding upon Christians. It does not contain any hint that the author wished to have it supposed that he was Barnabas; and the spirit and style of the epistle indicate that the writer was a Jew of the Alexandrian school who had embraced Christianity.

Next to Barnabas we place CLEMENT, who was bishop of the church at Rome about the end of the first century, and is believed to be the same Clement whom Paul (Philip. iv. 3) calls his fellow-labourer, and one of those whose names are in the Book of Life. The "Epistle of the Church of God sojourning at Rome to the Church of God at Corinth," which

bears the name of this father, was written about the year A.D. 96, and has been termed the most important monument of this apostolical age remaining to us, and is probably the most ancient of uninspired Christian writings. It was held in such high respect during the first centuries that it was read at public worship in many of the churches along with the scriptures of the New Testament. The object of the writer was to allay some internal dissensions in the Corinthian church, and to conciliate the minds of the people to their pastors, some of whom they had expelled from their offices, undeservedly as Clement asserts, and had thereby introduced much confusion into the church. This epistle is genuine in the main, but it has been subjected to several important interpolations. A portion of what is termed a second genuine epistle of Clement has been preserved, but it is manifestly only the fragment of a homily. Two other epistles ascribed to this father, and termed Recognitions, have been preserved in the Syrian Church. They are circular letters addressed particularly to those Christians of both sexes who lived in the state of celibacy. These epistles, however, are found nowhere cited before the fourth century, and they bear every mark of having been forged in some Eastern church about the close of the second or during the course of the third century.

Under the name of HERMAS (whom some suppose to be the same as the person mentioned in Paul's epistle to the Romans (chap. xvi. 14) we have a work entitled "The Shepherd," because in the second book an angel, the appointed guardian of Hermas, is introduced in the character of a shepherd. The work, which was written originally in Greek, but has been preserved for the most part in a Latin translation, was held in high repute among the Greek writers of the second century, and is cited by Irenæus under the title of "The Scripture." "It consists of three books, in the first of which are four visions, in the second twelve commands, in the third ten similitudes. The first and third parts are very fanciful, yet they were not perhaps unsuited to the genius of the countries and age to which they were addressed; the second contains some excellent moral precepts, and all abound with paraphrastical allusions to the books of the New Testament."

IGNATIUS, bishop of the church at Antioch, during the journey to Rome which, according to tradition, terminated in his martyrdom, is said to have written seven epistles—six to the churches in Asia Minor, and one to Polycarp bishop of Smyrna. Five other epistles, which were for some time received as his composition, are now admitted to be spurious; and even the seven genuine epistles have been grievously corrupted and interpolated. These interpolations have evidently been made by some zealous partisans of the priesthood, for the purpose of unduly exalting the episcopal dignity. In the epistle to Polycarp it is said, "Attend to the bishop that God may attend to you. I pledge my soul for those who are subject to the bishop, presbyters, and deacons. Let my part in God be with them." "All of you," says the epistle to the Church of Smyrna, "obey the bishop as Christ obeyed the Father, and the presbytery as you would reverence the apostles, and the deacons as the commandments of God. Wheresoever the bishop may appear, there let the multitude assemble; even as the Catholic Church is there where Christ Jesus is. It is not lawful either to baptize or to celebrate an *Agape* without the bishop, but whatsoever he shall approve that is likewise well-pleasing to God." Again—"He who honours the bishop is honoured by God; he who acts without the knowledge of the bishop is in bondage to the devil." And the Ephesians are told that "it is their manifest duty to look up to the bishop as to the Lord himself." Statements such as these, inculcating upon the people the most unlimited and blind obedience to the hierarchical order, present such a marked contrast to the sentiments which had prevailed in the apostolic age, and which continued to prevail in the second century, that they can scarcely have come from the pen of Ignatius, who is supposed to have written about the sixteenth year of that century. A recent ecclesiastical historian, who is disposed to regard these and other similar expressions as genuine, accounts for them on the ground that it was the principal object of Ignatius to preserve the churches in strict union and discipline during the persecution which then threatened their destruction, by subjecting the faithful in rigid obedience to every order of their priesthood, but most especially to the highest. The days were then approaching, and were already come, he thinks, in which some severe system of subordination was absolutely necessary (under God's providence) for the preservation of the church.[1]

POLYCARP, bishop of Smyrna, who had been a disciple of the apostle John, according to Irenæus, wrote several epistles, but only one is now extant, addressed to the Church at Philippi. This epistle appears to have been written soon after the death of Ignatius, as it refers to his patience under suffering, and requests any information which the Philippians had obtained respecting him. It teaches the charitable spirit of Christian piety, and is valuable from containing many scriptural expressions and frequent quotations of the recorded words of Christ. It consists of thirteen sections, but the original Greek of the tenth, eleventh, and twelfth is lost, and they have been preserved in an ancient Latin version. As Polycarp suffered martyrdom in the reign of Marcus Aurelius, A.D. 167, in the ninetieth year of his age, his epistle to the Philippians was probably written before the middle of the second century.

Another class of the fathers of the church are the Apologists, who in the order of time immediately succeeded the Apostolical Fathers. The first of these is QUADRATUS, an evangelist or Christian teacher not connected with any particular church, but travelling about as a missionary to preach the gospel. His *Apology* has unfortunately not come down to us, but Eusebius has preserved the following remarkable passage from it:—

"The works of our Saviour were always to be seen, for they were real. Those that were healed and those that were raised from the dead were seen, not only when they were healed or raised, but they were always there; not only whilst he dwelt on the earth, but also after his departure, which they long survived, so that some of them have lived even to our own times."[2]

The first of the Apologists whose writings have come down to our times is JUSTIN MARTYR. He was a Samaritan by birth, and successively adopted the tenets of the Stoics, the Peripatetics, the Pythagoreans, and the Platonists, probably not so much from a taste for speculative inquiries, as from a longing after some stable ground of religious conviction. Having discovered by experience the insufficiency and emptiness of these systems of philosophy, he seems to have been attracted to Christianity by the courage and constancy with which its adherents endured the sufferings inflicted upon them by their persecutors.

"I was once," says he, "an admirer of the doctrines of Plato, and I heard the Christians abused; but when I saw them meet death and all that is accounted terrible among men without dismay, I knew it to be impossible that they should live in sin and lust. I despised the opinion of the multitude. I glory in being a Christian, and take every pains to prove myself worthy of my calling."[3] The conversion of Justin Martyr is supposed to have taken place about the year 133

[3] *Apology*, i., pp. 50, 51.

Fathers.

A.D. He wrote two Apologies for Christianity; the first addressed to Antoninus Pius, the second probably to Marcus Aurelius. They are valuable compositions, not only because they contain the most convincing arguments which had then been published in defence of Christianity, but also because they give numerous quotations from the four Gospels, and relate many interesting facts respecting the religious customs and ceremonies of the Christians of those early ages. Next to the Apologies, the largest and most important work of Justin is his *Dialogue with Trypho the Jew*. The object of this treatise is to prove that Jesus is the Messiah predicted and promised in the Old Testament Scriptures, and to vindicate the doctrines of Christianity against the objections of the Jews. It contains a good deal of useful matter, mixed up, however, with not a few weak arguments, as well as trifling and even erroneous interpretations of Scripture. It is probable that it was composed at a later period than either of the *Apologies*. Another production which bears his name is entitled an *Admonition to the Gentiles*. Its design is to convince the heathen of the insufficiency of their popular mythology as well as of their philosophical doctrines, and of the necessity of a divine revelation. It is supposed to be the same treatise which is cited by Eusebius and Photius under the title of *The Refutation*. *A Short Address to the Gentiles* is ascribed to Justin, but it differs from the style of his genuine writings, and its title is not to be found in the ancient indexes to his works. His book against Marcion, and a work which he wrote against all the heretical sects of his day, have both perished. The fragment of a treatise on the Resurrection was published under the name of Justin, by John of Damascus, in the eighth century, but its genuineness is extremely doubtful. The letter to Diognetus on the characteristics of the Christian worship compared with paganism and with Judaism, which is found among the works of Justin, has been classed, on high authority, among the finest remains of Christian antiquity. Its style and turn of thought, however, as well as the silence of ancient writers, prove that it could not have come from his hand, although it bears unmistakeable evidence of high antiquity.

After the death of Justin Martyr, TATIAN of Assyria, who had been educated a heathen, and was converted by him during a visit which he made to Rome, wrote a discourse to the Gentiles, in which he vindicates the "philosophy of the barbarians" against the contempt of the Greeks, who, nevertheless, had received from them originally the germs of all science and arts. He was followed by Athenagoras, who addressed his apology to the emperor Marcus Aurelius and his son Commodus. A work from the pen of Athenagoras, in defence of the doctrine of the Resurrection, has come down to our day. THEOPHILUS, bishop of Antioch, in the reign of the emperor Commodus, wrote an apologetical work in three books, which displays great learning and power of thought. He also wrote a treatise against Marcion and Hermogenes, and composed commentaries on various portions of the sacred scriptures.

The most prominent of the Apologists next to Justin Martyr was IRENÆUS, who was bishop of Lyons about the year 178 A.D. His principal work is his *Refutation of the Gnostic System*, in five books, which contains a confutation of most of the errors which had then appeared in the church. It has come down to us, for the most part, only in the old Latin translation, together with some fragments of the Greek original. Many of the writings of Irenæus are known to us merely by their names. Two of his epistles possess an historical interest on account of their object. One of these is supposed to have been addressed to Blastus, who was probably a presbyter in the Church of Rome, and who had occasioned a division in that church, by adhering to the custom of Asia Minor with regard to the time of holding Easter. The other epistle was addressed to Florinus, a presbyter with whom Irenæus in early youth had enjoyed the society and instructions of the venerable Polycarp, and who appears to have taught that God was the author of evil. "These doctrines," says the venerable writer, in his appeal to his former companion, "the elders who preceded us, who associated also with the apostles, did not teach thee; for while I was yet a boy, I saw thee in company with Polycarp in Asia Minor; for I bear in remembrance what happened then better than what happens now. What we have heard in childhood grows along with the soul, and becomes one with it: so that I can describe the place in which the blessed Polycarp sat and spake—his going in and out—his manner of life, and the shape of his person—the discourses which he delivered to the congregation—how he told of his intercourse with John, and with the rest who had seen the Lord—how he reported their sayings, and what he had heard from them respecting the Lord, his miracles and his doctrine. As he had received all from the eye-witnesses of his life, he narrated it in accordance with scripture. These things, by virtue of the grace of God imparted to me, I listened to even then with eagerness, and wrote them down not on paper, but in my heart; and by the grace of God I constantly bring them up again fresh before my memory."[1] All the writings of Irenæus which have come down to us display the peculiarly practical character of his mind in his mode both of conceiving and treating the doctrines of the gospel; and while they manifest his zeal for the great fundamental truths of our holy faith, they at same time show his sincere aversion to religious dissensions, and his moderation and liberality of mind in all controversies about unessential matters.

HIPPOLITUS, one of the disciples of Irenæus, according to Photius, occupied an important place among the ecclesiastical writers belonging to the first half of the third century. But unfortunately, only a few fragments of his works remain. From the list of his writings given by Eusebius and Jerome, it appears that, besides homilies, he composed treatises on a variety of subjects, exegetical, dogmatical, polemical, and chronological. For an account of the later fathers of the church, see articles under their names.

(Neander's *General Church History*, vol. ii.; Waddington's *Church History*, vol. i.; Campbell's *Lectures on Ecclesiastical History*.) (J. T—R.)

Fathom || Faun.

FATHOM, a measure of length containing six feet. It is chiefly used for regulating the length of cables and cordage, and to ascertain the depth of water and mines.

FAUN (in Latin *Faunus*), the name given in the Roman mythology to a class of deities or genii supposed to inhabit the forests and groves, and who were particularly reverenced by husbandmen. The fauni correspond to the Greek *panes*, and are confounded by the Roman poets with the satyrs, which chiefly differed from the panes and fauni by the want of horns. The fauns are usually represented as of human form, but with the tail of a goat, pointed ears, short horns, and a flat turned-up nose; sometimes with the feet of a goat; and generally clothed in the shaggy skin of some beast. They delighted more particularly in vineyards; and are frequently described as wearing crowns of ivy or of vine-leaves, because, like the satyrs, they belonged to the train of Bacchus. The poets describe them as of a half-brutal nature, and devoted to pleasure and sensuality;—a character strongly impressed on most of the ancient statues of fauns that have come down to us. Among the most celebrated of these are—the old faun dancing, in the Florentine museum—the young faun playing on a flute—and the sleeping faun, now in the gallery at Munich. These rural deities were regarded as the descendants of Faunus, one of the early kings of Latium, who in later times

[1] Euseb., lib. v., chap. 20.

was worshipped as presiding over fields, herds, and shepherds, and also as an oracular divinity. He is thus identified with the Greek Pan—the Mendes of the Egyptians. The festival of the Faunalia, celebrated on the fifth of December by the country people, had reference to Faunus as the protector of agriculture and cattle; and sacrifices were also offered to him at Rome on the ides of February. In his prophetic capacity he was supposed to reveal the future to man, partly in dreams, and partly by mysterious voices in certain sacred groves, one near Tibur, around the well Albunea, and another on the Aventine mount.

FAUNA, in *Mythology*. See Bona Dea.

FAUNA (from *Faun*), in natural history, a collective word, signifying all the animals of a particular region or country, and also a description of them; corresponding to the word *flora* in respect of plants.

FAUNALIA, in *Antiquity*, a rural festival celebrated by the Romans with great rejoicing on the nones or 5th of December, in honour of the god Faunus, as presiding over agriculture, herds, and flocks. See Faun.

FAUSTINA, wife of Marcus Aurelius, Emperor of Rome, A.D. 138–160, was the daughter of Antoninus Pius and his wife Faustina Augusta. She was the mother of Commodus—a son not unworthy of his maternal descent. Faustina was distinguished equally for her beauty and her licentiousness; and as cruelty usually accompanies sensuality when invested with power, she has been accused of causing the death of her son-in-law Verus, and with encouraging the rebellion of Avidius Crassus. These charges rest on no good foundation, but her infamy is upon record. Aurelius affected to be insensible to the irregularities of Faustina. He advanced her paramours to public employments, and on her death obtained for her divine honours. Her statue was placed in the temple of Venus; and the village in Cappadocia where she died was erected into a city with the name of Faustinapolis. This, as M. Crevier says, is carrying goodness *too far*. It was either weak credulity, or vain dissimulation; but the subsequent conduct of Marcus Aurelius, in admitting his son Commodus to the imperial power while he was yet a boy, evinced an equal want of judgment and dignity.

FAUSTUS. See Fust.

FAVERSHAM or Feversham, a municipal borough and market-town of England, county of Kent, 9 miles W.N.W. of Canterbury. It is governed by a mayor, 4 aldermen, and 12 councillors, and in 1851 contained 4595 inhabitants. The town is very ancient, and obtained from several of the early monarchs various charters and privileges, especially as regarded the judgment and punishment of offences committed within its own jurisdiction. The town consists of four principal streets, forming an irregular cross, in the centre of which is the town-hall and market-place. The parish church is a spacious cruciform structure, surmounted by a tower and spire. Faversham has a free grammar-school, national school, theatre, and assembly-rooms. Faversham Creek, which communicates with East Swale, is navigable for vessels of 150 tons up to the town. On 31st December 1853, 308 vessels of 15,300 tons aggregate burthen belonged to the port; and during that year 1532 vessels of 116,381 tons entered, and 1478 vessels of 44,983 tons cleared at the port. Market-days, Wednesday and Saturday. The oyster fishery is extensively carried on. There are several powder-mills in the vicinity, but the government mills have been discontinued.

FAVIGNANA, the ancient *Ægusa*, one of the Ægates or goat islands, lies off the W. coast of Sicily, 11 miles S.W. of Trapani. It is 6 miles in length from E. to W., by about 2 in breadth, and contains about 4000 inhabitants. The surface is low, but it is intersected from N. to S. by a range of hills, on the highest point of which, near the centre of the island, stands St Catherine's Castle. It has extensive tunny and anchovy fisheries, and an export trade in sheep, goats, poultry, &c.

FAVISSÆ, in *Antiquity*, underground reservoirs or cellars near a temple, where water was kept, or in which were deposited broken vessels and other things of no further use in the services of the temple.

FAVONIUS, the Latin name of the west wind; also called Zephyrus.

FAVORINUS or Phavorinus, a celebrated sophist, who flourished during the reign of Hadrian. He was a Gaul by birth, being a native of Arelate (Arles) in the south of France; but at an early age he left his native place, and travelling through Greece and Italy, mastered the languages and literature of these two countries. His extensive knowledge, combined with great oratorical powers, raised him to eminence both in Athens and Rome, where he lived on intimate terms with the leading literary men and philosophers of the day. Plutarch dedicated to him his treatise on Cold, and Herodes Atticus was made the legatee of his excellent library after his death. He enjoyed for a while the favour and protection of the emperor, with whom, however, he subsequently quarrelled. He used to boast that, though a Gaul, he could speak and write Greek; that though he had offended the emperor, he still continued to live; and that though a eunuch, he had been charged with adultery. The titles of some of his works, which comprised biography, philosophy, and history, have been preserved; but of the works themselves, the remains are not sufficient to afford the means of fairly testing their value.

FAWKES, Francis, a poet and translator, was a native of Yorkshire, and born in the year 1721. He studied at Jesus College, Cambridge; and entering into holy orders, was successively curate of Croydon, vicar of Orpington, and rector of Hayes, and finally was made one of the chaplains to the Princess of Wales. He published a volume of poems in 1761, but derived more fame from his translations of the minor Greek poets—Anacreon, Sappho, Bion and Moschus, Musæus, Theocritus, and Apollonius. These classic versions by Fawkes are still our best. We may safely predict, however, that when his translations are forgotten, superseded by more spirited versions, Fawkes will still be remembered for his fine song, *Dear Tom, this brown jug that now foams with mild ale.* This learned and jolly clergyman died on the 26th of August 1777.

FAWN, a young deer: a buck or doe of the first year.

FAYAL, one of the Azore Islands. See Azores.

FAYOUM, a province of Egypt. See Egypt.

FE, Fo—or Fohi, the chief god of the Chinese, whom they adore as the sovereign of heaven. He appears to be the same as the Ceylonese Bhudd. They represent him as shining all in light; with his hands concealed under his robes, to show that his power does all things invisibly. He has at his right hand the famous Confucius; and at his left Lao-Kieon, chief of the second sect of their religion.

FEALTY (*fidelitas*), in *Feudal Law*, denotes the oath taken by a tenant on his entry, to be true and faithful to the lord of whom he holds his land. Fealty bound the tenant to fidelity, the breach of which was the loss of his fee. All lands being held either mediately or immediately of the crown, fealty is commonly divided into general and special; the former, that due by a subject to his sovereign the latter, that which is due by a tenant to his immediate superior. Fealty is incident to every manner of tenure except tenures at will and frank-almoign, though it chiefly belongs to copyhold estates held in fee and for life. The law as to fealty continues unchanged, though the oath of fealty is now rarely or never exacted.

FEAR, a painful emotion or passion, excited by the apprehension of impending evil, and attended with a desire of avoiding it. It is used in Scripture for awe, reverence,

veneration; as in the expression—"The fear of the Lord is the beginning of wisdom."

Fear was deified by the Pagans. Tullius Hostilius introduced the worship of this deity at Rome; and the Ephori of Sparta erected a temple to Fear near their tribunal, in order to strike awe into those who approached it. Fear was likewise worshipped at Corinth and elsewhere.

FEAST, according to modern usage, is the homelier term for a banquet, an occasion of good eating and drinking, generally assembling a number of guests. Two or three centuries ago, however, it was used to signify an occasion of religious joy and thanksgiving, and it is still thus used in our Bibles and Prayer-Books. The word is formed from the Latin *festum*, which some derive from *feriari*, to keep holiday; though others, as Vossius for example, derive it from the Greek ἑστιάω, *I feast* or *entertain*, from ἑστία, *hearth*, or *fire*. As a time of rejoicing in England is generally celebrated chiefly by partaking of good cheer, it is easy to see how the original usage of the word has been superseded, and the word festival has been introduced as the more common term for a day of religious rejoicing.

Almost every religion, true or false, ancient or modern, has had its solemn feast days. They were divinely appointed among the Jews, who were directed to congregate at Jerusalem three times a year for the solemn celebration of the feast of the Passover, or of Unleavened Bread, the feast of Weeks, and the feast of Tabernacles (see Deut. xvi.), on which occasions they were to "rejoice before the Lord."

The ancient Greeks were similarly accustomed to congregate for the celebration of great religious solemnities; and as their gods gave peculiar sanction to recreation, the religious observances were followed by gymnastic exercises of various kinds. Hence arose those great festivals known to us as the Olympian, Pythian, Isthmian, and Nemæan games, which at a very early period drew together the Greeks of every name and country at stated periods. In process of time they had many others.

The Romans also had numerous stated feasts in honour of their deities and heroes; as the Saturnalia, Cerealia, Lupercalia, Liberalia, Neptunalia, Consualia, Portumnalia, Vulcanalia, Palilia, Divalia, and others. They had also feasts instituted occasionally, as Carmentalia, Quirinalia, Terminalia, Floralia, Compitalia, Lemuria, Vernalia; besides other moveable and occasional ones, to give thanks to the gods for benefits received, to implore their assistance, or to appease their wrath, as the Paganalia, Feralia, Bacchanalia, Ambarvalia, Amburbalia, Suovetaurilia, and various others, denominated *feriæ;* as Sementinæ, Latinæ, &c. The feasts were divided into days of sacrifice, and days of banqueting; days of games, and days of rest or *feriæ*. As there was but little history written, or at least published, in those days, one object of these feasts was to preserve the remembrance of past occurrences.

The Mohammedans, besides their weekly feast or Sabbath, which is observed on Friday, have two solemn feasts, the first of which is called the Feast of Victims, and celebrated on the tenth day of the last month of their year; and the second is called Bairam. The Chinese have two solemn annual feasts in memory of Confucius; besides others of less note on various days of the year.

The feast days of modern Christendom include all Sundays in the year, and certain week-days in commemoration of the nativity, the circumcision, and the ascension of our Lord; the annunciation and the purification of the Virgin; the epiphany or manifestation of Christ to the Gentiles: besides one devoted to the memory of each of the principal apostles and evangelists; one to St Michael and all angels; one to the Holy Innocents; and one to include all saints in general. These week-days are not only feasts but *feriæ* wherever the Roman Catholic religion has full sway. On the other hand, the Presbyterian and other nonconforming churches take no notice of them whatever. As to the time of their celebration, the feasts of the Christian church are said to be moveable or immoveable. The *moveable feasts* are always celebrated at a certain interval of time before or after Easter Sunday, which, to conform it to the time of the Passover, is kept on the first Sunday after the first full moon that happens on or after the 21st of March. The *immoveable feasts* are those which are celebrated always on the same day of the year.

The prodigious increase of festival days in the Christian church commenced towards the close of the fourth century, and was occasioned by the discovery which was then made of the remains of martyrs and other holy men, in commemoration of whom they were established. But instead of being set apart for pious exercises, these festivals were spent in indolence, voluptuousness, and criminal indulgences. Many of them were even instituted on pagan models, and perverted to the most scandalous purposes. (For a particular account of religious festivals in England, see *Historia Sacra, or the Holy History*, giving an exact and comprehensive account of all the feasts and fasts of the Church of England; 2d edit., 8vo, London.)

Feasts of the Ancients. In the *Odyssey* (b. i.) we read of two kinds of feasts; the one called *eilapine*, given by a single host; the other called *eranos*, which was of the nature of a club, in which each guest shared the expense. At the former kind there were—1st, the proper guests; 2d, the *shadows*, or those brought in by the invited guests; 3d, the *parasites*, a kind of sponging buffoons who came in without any invitation. Among the Greeks it was not the custom to invite women; but it was otherwise with the Romans. As soon as the guests arrived at the house of their host, their sandals were removed by slaves, and their feet washed and anointed. It would appear that in the Homeric age it was the custom to *sit* at meals; but the recumbent posture was afterwards adopted, and the guests were arranged around the table on couches. Two persons usually reclined on each couch; or three among the Romans; but the number varied. (The manner of reclining at table is described under Accubation.) In eating, as the luxury of knives and forks was unknown, the Greeks made use of their fingers; but they used spoons in partaking of soup and other liquids. The distributor gave to each guest his proper portion of the viands, which were cut beforehand into small pieces. There were three courses. The first consisted of such things as were calculated to whet the appetite, though this was rather a refinement of the Romans; the second or principal course then appeared; and this was followed by the dessert, at which the delicacies were produced. The tables (which were not covered with cloths as with us) were wiped with sponges after each course. Water for washing the hands was also handed round, but every person brought his napkin with him. The guests arrayed themselves in white garments, wore chaplets of flowers on their heads, and often anointed the hair and beard with fragrant oils. The banqueting-room, too, was decorated with garlands of roses, which were suspended above the table as the emblem of silence or secrecy; and hence the phrase, to utter a thing *sub rosa*. All the requisites for the entertainment were provided by the *symposiarch*, or master of the feast, who was either the host himself or a person of his selecting; and the *king* of the feast, or *arbiter bibendi*, presided over the drinking. The cupbearers (generally beautiful boys) presented the wine in goblets, which were frequently of exquisite workmanship, and decorated with wreaths. The luxurious Romans drank out of cups made of crystal, amber, or the costly porcelain called *murrha*, as also of onyx, beryl, and richly-chased gold set with precious stones. The wine, which was usually much diluted with water, was mixed in a large vessel called a *crater;* and from that it was transferred to the goblets by

means of a *cyathus* or ladle. It was customary to introduce the drinking by making a libation of unmixed wine to the "Good Genius;" and this ceremony was usually accompanied with the singing of the *pæan*, and the playing of flutes. Then the mixed wine was produced, and the first cup was drank to "Jupiter the Preserver." The number of cups was regulated sometimes by that of the Graces, or more frequently by that of the Muses; yet even this number was often exceeded—for it was not unusual both to drink all round, and also to the health of absent friends and mistresses, besides as many cups as the name contained letters. In this, however, and likewise in other particulars, banquets differed with the character of the guests; for a symposium of young men and one of philosophers and statesmen had different kinds of entertainment. The *symposia* of Plato and Plutarch give us a lively idea of such entertainments. From them we learn that, besides the conversation, which was sometimes of a serious and philosophic cast, but frequently consisted in sallies of wit and repartee, together with enigmas and riddles (a very favourite kind of amusement), they had also singing and other music. When the repast was ended, the flute-players, female singers, dancers, and buffoons, were introduced; or the guests themselves engaged in games of various kinds, among which the *cottabus* is famous. (See COTTABUS.) At the close of solemn and splendid feasts the distribution of the *apophoreta* took place, which were presents given by the host to his friends to take home with them.

FEATHERS, the peculiar exterior covering of birds, constituting what is called their plumage. Feathers vary in size, form, colour, and function, in different species, in the several parts of the same individual, and also in the same bird at different stages of its existence; and their exquisite adaptation to the several ends they are designed to serve has often been adduced as illustrative of creative wisdom. "The covering of birds," says Paley, "cannot escape the most vulgar observation: its lightness, its smoothness, its warmth, the disposition of the feathers all inclined backward, the down about their stem, the overlapping of their tips, their different configuration in different parts, not to mention the variety of their colours, constitute a vestment for the body, so beautiful and so appropriate to the life which the animal is to lead, as that we should have no conception of anything equally perfect if we had never seen it, or can now imagine anything more so."

Feathers, when analyzed chemically, seem to possess nearly the same properties with the hair of mammifers and the scales of reptiles; but they differ essentially from the integuments of these classes of animals in respect to mechanical structure—being much more complex in their constituent parts. The principal parts of an ordinary feather are the tube or quill, the shaft or stem, and the vane. The quill is a hollow semi-transparent cylinder composed of coagulated albumen, and is more or less protracted. It closely resembles a thin piece of clear horn, both in appearance and chemical constitution; while at the same time it combines, in an eminent degree, the opposite qualities of strength and lightness. The horny substance of the quill in many species is disposed internally in longitudinal fibres, while the outer part is composed of transverse or annular fibres. Hence the reason why, in making a pen, the slit is always cleanest when the exterior or annular layer has been scraped off. The dry and shrivelled membranous substance inclosed in the cavity of the quill forms part of an apparatus that has been subservient to the growth of the other parts of the feather, and consists of an imbricated series of conical capsules communicating with each other. The quill is also provided at each end with a small orifice (termed respectively the upper and the lower umbilicus) through which nourishment is conveyed to the other parts of the feather.

The shaft, which is a continuation of the quill, and composed of an attenuated pellicle of the same substance, gradually passes into a sub-quadrangular form, narrowing until it forms a point at the tip. The back is more or less convex for some distance from its origin, and the face is formed of two convex surfaces which are separated by a groove that runs along its whole length, or of two inclined planes meeting at an obtuse angle; while the lateral surfaces are more or less plane. The white medullary substance forming the interior of the shaft, is called the *pith*—a substance *sui generis*, and which supplies strength and nourishment to the feather.

The vane, or that part which gives the feather its breadth, consists of two webs (one on each side of the shaft), and is by much the most complicated of all its parts. The webs consist of a series of laminæ called *barbs* or *rays*, which are set obliquely to, and are composed of the same material as, the shaft from which they spring. The barbs are arranged in close apposition, with their broad surfaces towards each other—a disposition that enables them to offer very considerable resistance to being bent out of their plane, or that direction in which they have to encounter the impulse and pressure of the air, particularly in the act of flight; while it admits of their yielding readily to the slightest pressure in the line of the shaft. The barbs taper to a point towards the outer edge of the vane; but at their base they are broad, (particularly in the great feathers of the wing,) and slightly hollowed on one side and convex on the other. This conformation both gives strength to each individual barb, and also enables it to afford support to its neighbour. But the most complex part of the mechanism of the vane is the apparatus of *barbules*, by means of which the barbs are kept firmly in apposition. The barbules are minute filaments that proceed from the upper part or edge of each barb, in two sets, one on either side, and having a direction, with respect to the barb, similar to that of the barbs with respect to the shaft. Those on the side next the quill are shorter, more adpressed, and curved upwards at the extremity; those on the side next the tip of the feather are longer, more patulous, and curved downwards: and when placed in apposition they form two distinct and continuous edges, the incurvate or anterior series of one barb overlapping and hooking into the recurvate posterior series of the barb next to it; and in this manner they give the barb a closeness and compactness of texture that resembles the effect of glutinous cohesion. When this connection is disturbed by external violence, the barbules reclasp when the barbs are again brought into apposition. When the barbs are pulled asunder in the plane of the web, their cohesion is found to be very considerable in most feathers: when the posterior barb is pulled downwards out of the plane of the web, the cohesion is found still greater: but when the anterior barb is pulled downwards, or the posterior barb upwards, there is no cohesion at all. The barbules themselves are frequently complicated by a similar apparatus, giving off laterally two series of filaments called *barbicels;* but these are much more sparse than those of the barbs, though they appear to serve a similar end, namely, that of retaining the barbules in apposition. When this clasping apparatus is wanting, as in the ostrich, the barbules hang loose and separate, and the feather is then termed a *plume*. In some birds, as the emeu, two plumy feathers arise from one quill; or even three, as exemplified in the cassowary.

There is in feathers the following gradation in respect to division:—1st, a feather may consist of a quill and a shaft, without any other part; 2d, of a quill, a shaft, and barbs destitute of barbules, as in the crest-feathers of the golden pheasant; 3d, of a quill, a shaft, barbs, and barbules, as in most birds; 4th, of a quill, shaft, barbs, barbules, and barbicels, as in the quills of the ring-tailed eagle, the albatross, and helmet-hornbill. In most birds, each feather possesses a downy tuft, more or less developed, at the upper end of

the quill; and this is termed the *accessory plume.* In the cassowary this development is two-fold. In the feathers of many birds the downy part occupies by far the greater portion, while in others it scarcely exists. As an example of feathers all downy may be mentioned the subcaudal feathers of the peacock, and the abdominal feathers of the eagle-owl, &c. Of such as have very little down may be mentioned the different species of penguin. On the different parts of the body in many birds there exist feathers of a piliform character, resembling stiff bristly hairs. Besides the feathers now described, the bodies of many birds are closely invested (underneath the feathers proper) with a soft down, the warmth or lightness of which is generally proportioned to the habits of the species; being usually most dense in aquatic birds, as in the eider-duck. Each down-feather consists of an extremely delicate shaft, from which proceed, in general, two sets of finely ciliated filaments. Down also constitutes the first covering of young birds, previous to the development of feathers, which they guide as it were through the skin, in the same manner that the old feathers during the moult of full-grown birds serve as the *gubernacula* of the new. It may be observed generally, that in some species the down presents certain modifications of structure different from that now described, as in the case of other kinds of feathers. In most birds, after the feathers have been removed, we find a number of simple feathers resembling hairs. These are the hairs singed off in a common fowl after it has been plucked. In the common pheasant their structure is as follows:—from a very short bulbiform tube rises a very slender roundish piliform shaft, somewhat resembling a hair of the human head, but much smaller and straight, and giving off at its extremity two or three short simple barbs on either side.

Every feather may well be said to be "a mechanical wonder," when we consider the perfection of its parts and the mechanism employed in its formation—the vessels that secrete the fluid material, and the moulds and capsules by which the process of formation is conducted, until the period when the protecting sheath gradually withers and crumbles away, leaving the young feather to unfold its beautiful and complicated structure. Ornithologists give special names to the feathers of the different parts of the body, indicative of their position or particular function; but an enumeration of these would be of little interest to the general reader, and may be found in any elementary treatise on ornithology.

As intimately connected with the plumage, it should be noticed that the feathered race generally are provided with a kind of oiling apparatus, situated at the base of the tail, and consisting of a double gland with a pore, filled with an unctuous matter, which the bird expresses by means of its beak and distributes over its feathers, thereby rendering them impervious to moisture.

As to the colours of the plumage, the variety is almost infinite, presenting every gradation from the most sombre shade and purest white to hues that rival in brilliancy the richest gems or the most gorgeous flowers; as in the humming-bird, creeper, and sun-bird. The feathers of young birds rarely exhibit the colours they are destined to assume at a later period: the livery of the female too is generally less lively, and sometimes altogether different from that of the male bird: and sometimes the summer plumage is quite distinct from that of winter. Moulting usually takes place after the female has laid her eggs, (with less regularity in the domesticated birds), and is characterized by the dulness and roughened aspect of the plumage, and the temporary loss of voice among singing birds.

Uses to Man.—Feathers make a considerable article of commerce; particularly those of the ostrich, heron, swan, eider-duck, peacock, goose, common domestic fowl, &c., which are used for plumes and ornaments, beds, pens, &c. It has often been said that living geese are plucked in some parts of Great Britain several times a-year; but we believe that this barbarous practice is by no means general, though it still exists in some places, as in Lincolnshire, and in the north of Ireland. The Somersetshire feathers once had a high reputation, but no extra quantity has been produced there for a long period. The common method of curing small feathers, such as those used for bedding, is to expose them to the sun in a dry room, and then to put them in bags and beat them with poles, to remove all adhering extraneous particles; but this object is now effected much more perfectly by steeping the feathers in a chemical solution, and then washing and drying them gradually, so as to prevent them shrinking. The Greenlanders use the downy skin of the eider-duck as a protection against cold. The feathers of the ostrich are much prized as ornamental articles of dress; and the capture of these birds for the sake of their plumes affords employment to many of the inhabitants of the desert. Feathers are also occasionally applied to a variety of other ornamental purposes, not the least curious of them being that of forming pictures, in the manner of mosaic, of the splendid feathers of the humming-bird, though it must be admitted that the effect is by no means commensurate with the labour required for their production. The French and Italians are particularly skilful in fabricating feathers into beautiful imitations of flowers.

FEBRIFUGE, an appellation given to such medicines as serve to mitigate or remove a fever.

FEBRUARY, the second month of the year. In ordinary years it contains 28 days; but in bissextile or leap-year, by the addition of an intercalary day, it consists of 29 days. This month was not in the Romulian calendar. In the reign of Numa two months were added to the year, namely, January at the beginning, and February at the end; and this arrangement was continued until B.C. 452, when the decemvirs placed February after January. The ancient name of *Februarius* was derived from the verb *februare*, to purify; or from *Februa*, the Roman festival of general expiation and lustration, which was celebrated during the latter part of this month. In February, also, the Lupercalia were held, and women were purified by the priests of Pan Lyceus at that festival.

FÉCAMP, a seaport-town of France, department of Seine-Inférieure, situated on the English channel, at the mouth of a small cognominal river 23 miles N.N.E. of Havre. Pop. about 10,000. It occupies the bottom and sides of a narrow valley opening out towards the sea between two high cliffs, on one of which stands a lighthouse. Its port, though small, is one of the best on the channel, and has latterly been greatly improved by the construction of an inner port with a fine quay, &c. It carries on a considerable trade in Baltic and colonial produce, brandy, salt, &c.; and sends out vessels to the whale, cod, mackerel, and herring fisheries. The river affords abundant water-power for numerous cotton, oil, and other mills. Fécamp has also sugar refineries, tanneries, building docks, and manufactures of hardware, candles, soda, &c. The town consists almost entirely of one street upwards of two miles in length. The church, a large and handsome edifice, is the sole remains of a celebrated abbey founded towards the end of the tenth century, and destroyed during the Revolution.

FEDERAL, of or belonging to a league or covenant: a term usually employed to designate the government of a confederacy consisting of several united sovereign states. The principal purposes for which such a union is formed are, the protection of the common interests of the members, their defence against the attacks of foreign enemies as well as against internal convulsions, and the superintendence of their political and commercial intercourse with other nations, together with the regulation of the commerce between the confederated states themselves. To accomplish these

purposes, the federation must be invested with full power to levy troops, to build and equip fleets, to raise the money requisite for the support of an army and navy, to prescribe rules for their government, and to direct their operations. The members of the union must therefore surrender to the joint body certain sovereign powers which they have been accustomed to exercise in their several states. The interpretation of the contract which determines the extent of the powers to be surrendered must belong to the joint body; but it will be necessary for the protection of the rights of the various members against the encroachments of the federation, that any one party should be allowed to withdraw from the union at pleasure. The degree to which the sovereign states united under one federal government have given up their individual rights varies considerably. In some confederations there is no federal government, and the union between the various associated states is not closer than a mere treaty, offensive and defensive, would effect between two states. In others the government is invested with unlimited discretion to take measures for the common defence—to make requisitions of men and money—to govern the common army and navy, and to direct their operations; and the proceedings of the government are made constitutionally binding upon all the associated states, even without their unanimous consent. In the old Germanic empire, one member might wage war with another; in the Swiss confederation, the different states are allowed to conclude treaties with foreign powers, unless they are expressly prohibited by the constitution; while the confederated states of North America have surrendered among other things all political power in so far as it relates to foreign affairs. Professor Austin makes a distinction between a supreme federal government and a system of confederated states. The former enforces its commands in each and all of the associated states, whereas the latter, through their representatives or delegates, may assemble and pass resolutions which concern all the members of the confederacy, yet leave these resolutions to be enforced in each state by its own sovereign power. In this system, therefore, each of the several societies is an independent political society, and each of their several governments is properly sovereign or supreme. For an example of this system of confederated states, the professor refers to the German confederation, which has succeeded to the ancient empire. "I believe," he says, "that the present diet is merely an assembly of ambassadors from several confederated but severally independent governments; that the resolutions of the diet are merely articles of agreement, which each of the confederated governments spontaneously adopts; and that they owe their legal effect in each of the compacted communities to laws and commands which are fashioned upon them by its own immediate chief. I also believe that the Swiss confederation was and is of the same nature. If, in the case of the German or of the Swiss confederation, the body of confederated governments enforces its own resolutions, those confederated governments are one composite state rather than a system of confederated states. The body of confederated governments is properly sovereign: and to that aggregate and sovereign body, each of its constituent members is properly in a state of subjection."

The principal examples of this form of government have been the confederacy of the ancient Grecian republics, and in more modern times, the Germanic empire, the Swiss republics, and the United States of North America. There is conclusive evidence that several associations existed at a very early period among the Grecian states, for the purpose of repelling the attacks of their common foes, and of protecting the temple of their common deity. The most important of these confederations was the union of the twelve tribes, which constituted the AMPHICTYONIC LEAGUE. All the members of this confederacy retained the character of independent states, and, though some of them were very insignificant, had equal rights and equal votes in the federal council, which met twice every year, in the spring at Delphi, and in the autumn at Anthela, near the pass of Thermopylæ. The deputies who were sent to these meetings were appointed in their respective states by lot, and each state had two votes. The council was empowered to watch over the temple at Delphi, and to guard the immense wealth deposited there—to decide all controversies between the members of the league—to inflict a fine upon the aggressor—to employ the whole power of the confederacy to punish those who should disobey its mandates—to admit new members—to declare and carry on war, and generally to adopt whatever measures it deemed necessary for the common welfare of the confederation. The Amphictyons were bound by an oath mutually to protect and defend the associated states, and to inflict vengeance on those who should sacrilegiously despoil the temple of the deity whose worship formed the external bond of union among them. The objects of the Amphictyonic confederacy were no doubt wise and humane, but they were never adequately carried out, and in their active interference in the affairs of Greece the council showed themselves more influential for evil than for good. The more powerful members successively tyrannized over the weaker. There was no cordial co-operation among them even in the midst of the most dangerous defensive wars, and their mutual jealousies and incessant quarrels paved the way for the ruin of their liberties and independence.

Another confederacy of Grecian republics was the famous ACHÆAN LEAGUE, which dates from the year B.C. 280, though it did not rise into importance till about thirty years later. The states composing this league, as in the former instance, enjoyed a perfect equality. They retained their municipal jurisdiction, and appointed their own officers, but they had all the same laws and customs, the same weights and measures, and the same money, though it is uncertain whether this was the result of their own choice, or proceeded from the authority of the federal council. This council had the sole right of peace and war, of sending and receiving ambassadors, of entering into treaties and alliances, and of appointing a prætor or chief magistrate, who, with the advice and consent of ten of the deputies, administered the government in the recess of the council. At first the council had two prætors or presidents, who were nominated alternately by the different towns, and were associated in the administration, but after a short trial only one was elected. The union among the members of the Achæan League was much closer, and its organization more judiciously framed than in the case of the Amphictyonic confederacy. The united testimony of all the historians who have taken notice of its affairs, shows that the government of this federal league was administered with far greater justice and moderation; and the citizens of the various states under its superintendence were much less turbulent and seditious than in any of the cities of Greece which exercised singly all the prerogatives of independent and sovereign states. The popular government, says the Abbé Mably, which was so tempestuous elsewhere, caused no disorders in the members of the Achæan republic, because it was there tempered by the general authority and laws of the confederacy.

In later times, another example of a federal government was exhibited by the GERMANIC EMPIRE, the administration of which was vested in a representative diet, in the emperor to whom the powers of the executive were entrusted, and in two judiciary tribunals (the imperial chamber and the aulic council) which possessed supreme jurisdiction in all disputes among the members of the confederacy. To the diet was entrusted the general power of legislating for the empire—of making war and concluding peace—forming alliances—assessing quotas of troops and money—constructing fortresses—regulating the coinage—admitting new members,

and subjecting refractory members to the ban of the empire. To the emperor belonged the exclusive right to make propositions to the diet—to negative its decrees—to name ambassadors—to confer dignities and titles—to fill vacant electorates—to receive and disburse the public revenues, and generally to watch over the public safety. In certain cases he was assisted by a council formed of the electors. In theory this federal constitution seemed well fitted to gain the end for which it was framed; but experience has shown that it afforded no security either against external dangers or internal dissensions. "The history of Germany," it has been justly said, "is a history of wars between the emperor and the princes and states—of wars among the princes and states themselves—of the licentiousness of the strong, and the oppression of the weak—of foreign intrusions and foreign intrigues—of requisitions of men and money disregarded or partially complied with—of attempts to enforce them, altogether abortive, or attended with slaughter and desolation, involving the innocent with the guilty—of general imbecility, confusion, and misery."[1]

The United Provinces of the Netherlands were a confederation composed of seven co-equal and sovereign states, each of which consisted of several equal and independent cities. The sovereign authority was vested in the states general, consisting usually of about fifty deputies, who held their seats, some for life, some for a fixed limited period, and in two cases during pleasure. In all important matters, not only the provinces, but the cities, required to be unanimous. The executive magistrate was the stadtholder, to whom was entrusted the command of the army and navy, with authority to appoint all naval and military offices, to assist at the deliberations of the states general, and to settle all disputes between the provinces. The history of this celebrated confederacy has shown that its practice differed widely from its theory; and the mutual jealousies of its members, and the weakness of the government, ultimately brought the league to anarchy and dissolution.

The Swiss Confederation consists of twenty-two sovereign cantons, united for "the maintenance of their liberty, their independence, and security against any attacks from abroad, as well as for the preservation of order and tranquillity at home." For these purposes, a certain fixed contingent of troops is furnished by each canton whenever required, amounting in all to about 34,000, and the reserve, in case of need, to as many more. A pecuniary contribution for defraying the military and other general expenses of the confederacy is also paid by each canton in proportion to its property and resources. The diet consists of the deputies of the twenty-two cantons, who are chosen by their respective governments. It is entrusted with authority to declare war, to conclude peace, and to form alliances with foreign powers; and on these occasions three-fourths of the votes are necessary to constitute a majority. All other questions are decided by a simple majority. The diet also appoints the military officers and the diplomatic agents of the confederation, settles disputes among its members, acts the part of mediator in cases of internal disturbances within a canton; and, in general, takes all steps that may be deemed necessary for the safety of the country. No canton is allowed to go to war with another canton, and the diet may have recourse to arms to punish the violation of this or of any other fundamental law of the confederacy. The ordinary sessions of the diet, which last about five weeks, are held annually in the chief town of one of three vororts, or directing cantons, Zurich, Berne, and Lucerne, which hold the office of vorort by turn, for two years. The council or executive of the directing canton for the time being, along with its burgomaster, is entrusted with the management of the affairs of the confederation during the recess of the diet, but it is assisted in its duties by a federal chancery, consisting of a chancellor and a secretary, both appointed by the diet.

It will be evident from these statements, that the Swiss republics do not form one united state, but rather a confederation of states, having each their own peculiar constitution. They have, properly speaking, no permanent federal executive, and the diet is merely an assembly of delegates, who vote according to the instructions given by their constituents.

In this respect the Swiss confederacy differs widely from the United States of North America, which have a permanent executive, with a federal treasury and army and navy at its disposal. The federal legislature or congress consists of two bodies—a house of representatives chosen for one or two years, and a senate for a period varying from two years to six—the former by popular election, the latter by the representatives of the twenty-four states. The congress has power to provide for the common defence and general welfare of the United States—to regulate commerce with foreign nations and among the several states—to levy taxes and coin money—to declare war—to raise and support armies—to establish and maintain a navy—to provide for organizing, arming, disciplining, and calling forth the militia—to admit new members into the Union—to constitute tribunals inferior to the supreme court—to regulate and dispose of the territory or other property belonging to the United States; and, in general, to make all laws which may be regarded as necessary for carrying into execution the foregoing and all other powers vested by the constitution in the government of the United States, and to propose amendments in the constitution, which, however, shall not be held valid unless ratified by the legislatures of three-fourths of the several states.

The executive power is vested in the president for the time being, who holds his office for four years, but is occasionally re-elected for four years more. He is commander-in-chief of the federal army and navy, and of the militia when called into active service; and has power, with the advice and consent of the senate, to make treaties, to appoint ambassadors, the judges of the supreme court, and the other public ministers, consuls, and officers of the United States, whose appointments are not otherwise provided for by the constitution. He has a partial and temporary veto upon the measures adopted by congress. But if, on reconsideration of the bill objected to by the president, two-thirds of both houses adhere to their approval of the measure, it becomes a law.

A few amendments have been made on this form of government since its promulgation in 1798, but the constitution itself has stood the test of more than half a century, though exposed to several by no means inconsiderable dangers. In 1827, the constitutional right of congress to legislate for all the states of the confederation was called in question by South Carolina, Georgia, and Virginia. The cause of this hostility to the Union was the reduction of the tariff on foreign produce, which was vehemently opposed by these states; but a compromise on the part of the Union restored the good-feeling of the disaffected provinces, although the principle of nullification was left unsettled, and still continues to be so. The late violent discussions on the slave question have likewise been attended with the same hostility, and a threat to dissolve the Union.—(St Croix *des Anciens Gouvernements; The Federalist;* Vieusseau's *History of Switzerland.*) (J. T—R.)

FEE, in *Law*, the same as feud or fief, properly signifies a conditional stipend or reward, and is applied to property held of a superior on condition of rendering him service. An estate of inheritance is said to be in *fee-simple* when it is held in the freest manner, clear of any condition, limita-

[1] *The Federalist*, vol. i., pp. 114–116.

tion, or restrictions to particular heirs, and descendible to heirs general, whether male or female, lineal or collateral. Limited fees are such as are burthened and confined with conditions or qualifications; and these may be divided into two kinds, viz., *qualified* or *base fees*, and *fees conditional* or *fees tail*. A qualified or base fee is such as has a qualification annexed to it, and which must terminate when the qualification subjoined to it is at an end; *e.g.* an estate granted to A and his heirs, *tenants of the manor of Dale*, is determined whenever A or his heirs cease to be tenants of that manor. A conditional fee at common law was a fee restrained to particular heirs exclusive of others; as, to the heirs of a man's body, by which collaterals were excluded. In such case, if the donee had no heirs of his own body, the land reverted to the donor on the death of the donee; but if heirs were born, his estate became absolute and unconditional, so that he might aliene it, and thereby bar not only his own issue, but also the donor, of his reversionary interest. If, however, the tenant did not so aliene the land, the condition still remained in force; for if the issue had afterwards died without any alienation, the land, in terms of the donation, reverted to the donor on the death of the donee. This naturally gave rise to fictitious sales of land by tenants in possession, as soon as they had performed the conditions specified in the grant; so that on the reconveyance of the land into their hands they held it unconditionally, or in *fee-simple*. To abolish this practice, the statute of 13th Edw. I., cap. 1, commonly called the statute *de donis conditionalibus*, was passed, enacting that from thenceforth the will of the donor be observed, and that the land should go to the heirs specified, if there were any, or if none that it should revert to the donor. Thus the donee had no longer a conditional fee-simple which became absolute and at his own disposal the instant any issue was born; but the estate was divided into two parts, leaving in the donee a new kind of particular estate, denominated a *fee-tail*, and vesting in the donor the ultimate fee-simple of the land, expectant on the failure of issue; which expectant estate is termed a reversion. Estates tail are either general or special; the former being where lands and tenements are given to one, and the heirs of his body; the latter is where the gift is restrained to certain heirs of the donee's body; as where lands and tenements are given to a man and his heirs by his now wife. Estates in general and special tail are further diversified by the distinction of sexes in such entails, for either may be in tail male or tail female. See Entail.

FEEJEE or Fiji Islands, a group of islands in the South Pacific, lying between S. Lat. 15. 30. and 19. 30., and E. Long. 177. and 182., and forming part of the Friendly islands. The group comprises upwards of 150 islands, 65 of which are inhabited. They are of volcanic formation, are rich and fertile, and some of them are very mountainous. The productions are sugar-cane, cotton, coffee, cocoa-nut, bread-fruit, oranges, melons, citrons, olives, guavas, and sandal-wood. The natives are well formed and active, but warlike and cruel. The principal islands are Kantaon, Ovolau, Ambau, and Muthuatu. The Feejee islands were discovered by Tasman in 1643. Pop. estimated at 133,000.

FEITH, Rhynvis, a distinguished Dutch poet, was born at Zwolle, in Overyssel, in 1753. He studied law at Leyden, but not requiring to follow out that profession for a subsistence, he devoted most of his time to the study of art and polite literature. He rose to be burgomaster of his native town, and was afterwards appointed receiver at the Admiralty College. In 1779 he obtained a prize for a poem on the blessings of peace, and in 1781 the gold medal of the Leyden Poetical Society for a treatise on the essential characters of epic poetry. Of his tragedies the best is his *Iñez de Castro;* and his poem of *The Grave* is reckoned one of the best didactic poems in the Dutch language. Many of his occasional pieces are remarkable for purity of sentiment and loftiness of moral aim. He died in 1824.

FELEGYHAZA, a town of Hungary, capital of the district of Little Cumania, on the road between Pesth and Temesvar, 65 miles S.E. of the former. Pop. about 16,000. It has a Roman Catholic church, gymnasium, high school, and a court of justice, in which the archives of the district are preserved. It has also an extensive trade in corn, wine, fruit, and tobacco, and large cattle fairs are held here. Some Roman antiquities have been discovered in the vicinity.

FÉLIBIEN, André, Sieur des Avaux et de Javercy, a distinguished French writer on various departments of art, was born at Chartres in 1619. In his twenty-eighth year he was appointed secretary to the French embassy at Rome, and availed himself of his sojourn in that city to cultivate the acquaintance of the greatest living exponents of art, the most notable of whom at that time was his countryman Poussin. On his return home he was promoted to a number of important offices in connection with the arts and manufactures, and was made councillor and historiographer to the king. He died in 1695. His principal works are his *Entretiens sur les Vies et sur les Ouvrages des plus Excellents Peintres Anciens et Modernes*, 1666–88, 5 vols. 4to; *Principes de l'Architecture, de la Sculpture, et de la Peinture, avec un Dictionnaire des Termes propres de ces Arts*, 1676, 4to; and *Origine de la Peinture*, 1660, 4to.

His son, Jean François, inherited to a certain extent his taste for the fine arts, and enjoyed considerable fame as the author of the *Collection Historique des Vies et des Ouvrages des Architectes les plus Celèbres;* and also for his comparative view of ancient and modern Versailles.

FELICITAS, Felicity, or *Happiness*, was deified by the ancients. Lucullus consecrated a temple to Felicitas, as also did Lepidus. This goddess is generally represented on medals with a cornucopia in one hand and a caduceus in the other.

FELIS. See index to Mammalia.

FELIX, M. Minucius, a distinguished Roman lawyer, concerning whose era there has been much dispute. Some critics refer it to the middle of the second century after Christ, others to the time of Diocletian, while St Jerome, whose testimony may be taken as final, places him between Tertullian and Cyprian, and thus assigns him to the first half of the third century. He is now best known as the author of *Octavius*, a dialogue on Christianity between a Christian convert and a pagan. This work is deservedly entitled to rank high among the early apologies of Christianity. It is characterized throughout by an impressive earnestness of tone, and closeness and cogency of reasoning, while the style is as remarkable for precision and terseness as the diction for grace and purity. It was long imagined that the *Octavius* formed part of Arnobius' treatise *Adversus Gentes*, and it was not till 1560 that this mistake was discovered, and the work assigned to its rightful author by Balduinus. Since that date many editions of the work have appeared.

Felix, the name of several Roman pontiffs. Felix I. was chosen bishop of Rome in 271, and suffered martyrdom in 275. Felix II., sometimes styled III. on account of an anti-pope who assumed the former title, reigned from 483 to 492. Felix III., called also IV., succeeded to the papal throne in 526, and died in 530. A detailed account of Amadeus VIII., Count of Savoy, who became pope under the title of Felix V., is given under Amadeus.

FELLENBERG, Emanuel von, a celebrated educationist, was born in 1771 at Berne, in Switzerland. His father was of patrician family, and a prominent public man in his native canton, and his mother was a grand-daughter of the celebrated Dutch admiral Van Tromp. In both of his parents he was peculiarly fortunate, and to the tender and pious care of his mother he used to attribute the suc-

cess of his efforts for the public good in after life. From her and from Pfeffel, the blind poet of Colmar, he received a better education than falls to the lot of most boys, while the intimacy of his father with Pestalozzi gave to his mind that bent which it afterwards followed. As soon as he was able he began to make it the object of his life to investigate thoroughly the social and moral condition of his countrymen, and, in so far as he could, to improve it. For this purpose he spent much of his time in travelling through Switzerland, usually on foot, with a knapsack on his back, visiting the hamlets and farm-houses, mingling in the labours and occupations, and partaking of the rude fare and lodging of the peasants and mechanics, and often extending his journeys into the adjoining countries. In 1790 he went to Tübingen, where he distinguished himself by his rapid progress in legal studies. After the downfall of Robespierre, he went to Paris and remained there long enough to be assured of the storm impending over his native country. This he did his best to avert, but his warnings were disregarded, and Switzerland was lost before any efficient means could be taken for her safety. Fellenberg, who had hastily raised a levy *en masse*, was proscribed, a price was set upon his head, and he was compelled to fly into Germany. He was shortly afterwards recalled however by his countrymen, and sent on a mission to Paris to remonstrate against the rapacity and cruelty of the agents of the French republic. But in this and other diplomatic offices which he held for a short time, he was witness to so much corruption and intrigue that his mind revolted from the idea of a political life, and he returned home with a view to devoting himself wholly to the education of the young. With this resolution he purchased the estate of Hofwyl, near Berne, intending to make agriculture the basis of a new system which he had projected—for elevating the lower and rightly training the higher orders of the state, and welding them together in a closer union than had hitherto been deemed attainable. His scheme at first excited only the ridicule of his friends, but in the course of a few years it began to attract the notice of foreign countries, and pupils from every country in Europe flocked to Hofwyl, at once for the sake of studying agriculture, now raised to the dignity of a science, and of imbibing those wholesome moral precepts of which the agricultural system was made the exponent. For 45 years Fellenberg, assisted by his wife, and latterly by his sons, conducted this institution and raised it to the highest point of prosperity and usefulness; and when at length he died, Nov. 21, 1844, he left behind him the reputation of one of his country's greatest benefactors.

FELLOW, in *Colleges*, a distinction which entitles the holder to a share in the revenues of the college. The nature of fellowships is more particularly explained under the head UNIVERSITIES.

FELO-DE-SE, one who commits felony by suicide, or who, being of sane mind and the age of discretion, deliberately takes away his own life. The chattels, real and personal, of a felo-de-se are forfeited to the crown, but not his lands of inheritance; nor is his wife barred of her dower. The forfeited chattels, however, are usually restored upon the payment of certain fees. Formerly, a felo-de-se was buried in the highway, with a stake thrust through his body; but this barbarous usage was abolished by act 4th Geo. IV., cap. 52, which provides that he be privately interred in a burial-ground, between the hours of nine and twelve at night.

FELON, in *Law*, a person guilty of felony.

FELONY, in the general acceptation of the law, comprehends every species of crime which occasions at common law the forfeiture of lands or goods. This most frequently happens in those crimes for which a capital punishment either is or used to be inflicted; for those felonies which are called *clergyable*, or to which the benefit of clergy extends, were anciently punished with death in all lay or unlearned offenders; though now, by the statute law, that punishment is for the first offence universally remitted. Treason itself, says Sir Edward Coke, was anciently included under the name of *felony;* and in confirmation of this we may observe, that the statute of treasons (25 Edw. III. cap. 2), speaking of some dubious crimes, directs a reference to parliament, that it may be there adjudged "whether they be treason or *other* felony." All treasons, therefore, strictly speaking, are felonies; though all felonies are not treason. And to this also we may add, that all offences now capital are in some degree or other felonies; but this is likewise the case with some other offences which are not punished with death, as suicide, where the party is already dead, manslaughter, and larceny; all which are, strictly speaking, felonies, as they subject those who commit them to forfeitures. Upon the whole, therefore, the only adequate definition of felony seems to be that which was before laid down, namely, an offence which occasions a total forfeiture of either lands or goods, or both, at the common law, and to which capital or other punishment may be superadded, according to the degree of guilt.

The word *felony*, or *felonia*, is undoubtedly of feudal origin, being frequently to be met with in the books of feuds, and in other works; but the derivation of it has much puzzled the juridical lexicographers Pratæus, Calvinus, and others. Some derive it from the Greek φηλός, *an impostor* or *deceiver;* others from the Latin *fallo, fefelli*, to countenance which they would have called it *fellonia*. Sir Edward Coke has given a still stranger etymology; that it is *crimen animo felleo perpetratum*, a crime perpetrated with a bitter or gallish inclination. But all agree in the description that it is such a crime as involves the forfeiture of the offender's lands or goods. And this gives great probability to Sir Henry Spelman's derivation from the Teutonic or German, in which language, indeed, as the word is clearly of feudal origin, we ought rather to look for its signification, than amongst the Greeks and Romans. *Felon*, then, according to him, is derived from two northern words, namely, FEE, signifying the fief, feud, or beneficiary estate; and LON, which means price or value. Felony is therefore the same as *pretium feudi*, the consideration for which a man gives up his fief; as we say in common speech, such an act is as much as your life or estate is worth. In this sense it clearly signifies the feudal forfeiture or act by which an estate is forfeited, or escheats to the lord.

To confirm this we may observe, that in the sense of forfeiture to the lord, the feudal writers constantly use it. For all those acts, whether of a criminal nature or not, which at this day are generally forfeitures of copyhold estates, are styled *feloniæ* in the feodal law: *scilicet, per quas feudum amittitur*. Thus, *si domino deservire noluerit; si per annum et diem cessaverit in petenda investitura; si dominum ejuraverit*, id est, *negaverit se a domino feudum habere; si a domino in jus eum vacante, ter citatus non comparuerit;* all which, with many others, are still causes of forfeiture in our copyhold estates, and were denominated *felonies* by the feudal constitutions. So likewise injuries of a more substantial or criminal nature were denominated *felonies*, that is, forfeitures; as assaulting or beating the lord; vitiating his wife or daughter, *si dominum cucurbitaverit*, id est, *cum uxore ejus concubuerit;* all these are esteemed felonies, and the latter is expressly so denominated, *si fecerit feloniam, dominum forte cucurbitando* And as these contempts or smaller offences were felonies or acts of forfeiture, of course greater crimes, as murder and robbery, fell under the same denomination. On the other hand, the lord might be guilty of felony, or forfeit his seignory to the vassal, by the same act as that by which the vassal would have forfeited his feud to the lord. *Si dominus commiserit feloniam, per quam vasallus amitteret feudum si eum commiserit in dominum, feudi proprietatem etiam do-*

minus perdere debet. One instance given of this sort of felony in the lord is beating the servant of his vassal, so that his service is lost; which seems merely in the nature of a civil injury, in as far as it respects the vassal. And all these felonies were to be determined *per laudamentum sive judicium parium suorum*, in the lord's court; as with us forfeitures of copyhold lands are presentable by the homage in the court-baron.

Felony, and the act of forfeiture to the lord, being thus synonymous terms in the feudal law, we may easily trace the reason why, upon the introduction of that law into England, the crimes which induced such forfeiture or escheat of lands (and by a small deflection from the original sense, such as induced the forfeiture of goods also) were denominated *felonies*. Thus it was that suicide, robbery, and rape, were felonies; that is, the consequence of such crimes was forfeiture: but by long use we began to signify by the term *felony* the crime actually committed, and not the penal consequence thereof. And upon this system only can we explain the reason why treason in ancient times was held to be a species of felony; we mean, because it induced a forfeiture.

Hence it follows, that capital punishment does not by any means enter into the true idea and definition of *felony*. Felony may be without inflicting capital punishment, as in the cases instanced of self-murder, manslaughter, and larceny; and it is possible that capital punishments may be inflicted, and yet the offence be no felony, as in the case of heresy, by the common law, which, though capital, never worked any forfeiture of lands or goods—an inseparable incident to felony. And of the same nature was the ancient punishment for standing mute, without pleading to an indictment; which at the common law was capital, but without any forfeiture, so that such standing mute was no felony. In short, the true criterion of felony is forfeiture; for, as Sir Edward Coke observes, in all felonies which are punishable with death, the offender loses his lands in fee-simple, and also his goods and chattels; but in such as are not punishable he loses his goods and chattels only.

There is a discretionary power in justices either to admit to bail, or to commit to prison, as to all felonies (except treason). The compounding of a felony by taking a reward for forbearing to prosecute is punishable with fine and imprisonment, and the mere concealment of a felony is similarly punishable.

FELSPAR. See MINERALOGY, and GEOLOGY.

FELT, a kind of stuff resembling coarse cloth, made of hair or wool, without weaving. The fur of the hare, rabbit, seal, beaver, and the wool of the sheep, are the materials chiefly used for making felt. The hairs and loose flocks of wool are thoroughly mixed together by an operation called *bowing*, which depends on the vibrations of an elastic string; when, in consequence of their anatomical structure, they become matted together. This mass, after undergoing pressure to render it firmer, is dipped into a liquor containing a little sulphuric acid; and, when intended to form a hat, it is first moulded into a large conical figure, which is afterwards reduced in its dimensions by working it with the hands. It is afterwards formed into a flat surface, with several concentric folds, which are still further compacted in order to form the brim and the circular part of the crown. It is then forced on a block, which serves as a mould for the cylindrical part of the hat. The nap or outer portion of the fur is afterwards raised by the application of a fine wire brush. The hat is subsequently dyed and stiffened with glue, or with an aqueous solution of shellac. It need scarcely be observed, that these processes are not applicable to the silk hat now in such very general use. See HAT-MAKING. Besides its use in hat-making, felt is much employed to encase the cylinders of steam-engines, and is also rendered waterproof to be applied in the roofing of houses and many other ways. Attempts have been made to form woollen cloths by a process similar to that of felting, without spinning or weaving; but the cloth made in this way has little strength or durability.

FELTHAM, OWEN, author of the *Resolves, Divine, Moral, and Political*, was a native of Suffolk. Of his private life so little is known that the dates of his birth and death can only be appoximately conjectured. He was born in the reign of James I., and he was alive in 1677. Beyond this nothing has been ascertained concerning him, except that his learning and great moral worth gained for him the favourable opinion of the Earl of Thomond, and that he enjoyed the hospitality of that nobleman for several years. His only work, the *Resolves*, which is a collection of moral essays, divided into centuries, is replete with the most profound thought and brilliant wit exercised on subjects chiefly moral and religious, and displays at the same time so true and great a knowledge of the world that readers of every class cannot fail to be interested and instructed by a perusal of its pages. It has been very frequently reprinted.

FELUCCA (Ital. *feluca*), a little vessel with oars and lateen sails, common in the Mediterranean. It has a rudder at the stem and another at the stern, to be applied as occasion requires.

FELTRE, the ancient *Feltria*, a town of Northern Italy, delegation of Belluno, and 16 miles S.W. of the town of that name. It stands on a hill at the foot of the Alps, near the Piave, and has about 5500 inhabitants. The town is partially fortified, and contains a handsome market-place, cathedral, numerous churches, an episcopal gymnasium, diocesan school, orphan asylum, &c. It has some trade in corn, wine, and oil, and manufactures of silk twist, wax, and leather.

FEMERN, an island in the Baltic, belonging to Denmark, and lying off the coast of Holstein, from which it is separated by the Femer-sund, a channel about a mile wide. Area, 70 square miles. Pop. (1846) 8860. The surface is low and level, producing corn, and affording good pasturage for cattle, but the people devote their attention principally to fishing. The chief town of the island is Burg, containing about 1800 inhabitants.

FEMME COVERT, in *Law*, a married woman: as *femme sole* signifies an unmarried woman.

FEMININE, in *Grammar*. See GENDER, and GRAMMAR.

FEN, low land occasionally overflowed with water, or abounding with pools or lakes, with intervening spots of dry land. See AGRICULTURE, vol. ii., p. 362, &c.; BEDFORD LEVEL; LINCOLNSHIRE; and M'Culloch's *Statistical Account of Britain*, vol. i., p. 24.

FENCES. See AGRICULTURE, vol. ii., p. 269; GARDENING; HORTICULTURE; FOREST; and M'Culloch's *Statistical Account*, vol. i., p. 467.

FENCE-MONTH, the month in which deer begin to fawn, when hunting in the forest is prohibited. It commences fifteen days before Midsummer, and ends fifteen days after it.

FENCING, is the proper use of the small-sword or foil. The small-sword is a light court-dress sword, made to taper gradually from the hilt to the point, and of a size regulated by the judgment of the wearer, if he understand the use of the weapon. The foil, with which the art of fencing is practised, is a small quadrangular blade, about the length of a small sword, and mounted in nearly the same manner; but, for the convenience of the exercise, it is made lighter, blunted, and covered with leather at the point, to prevent accidents in practice.

The first weapon in use among mankind, whether for offensive or defensive purposes, appears to have been the sword, and combat with this weapon is perhaps nearly as old as the world. The most ancient book extant makes frequent mention of the sword, and the same thing may be

said of Homer, who is full of continual allusions to this weapon. The earliest swords were probably made of wood, like those used by the natives of Mexico when first visited by the Spaniards; but after the discovery of metals, bronze swords were introduced, of which kind many have at different times been found in Ireland. As soon, however, as the art of tempering steel had been discovered, that metal superseded all other substances in the fabrication of arms; nor is it probable that any change in this respect will take place, or that any further improvement is attainable. The form of the sword, however, has varied at different times and in different countries. Those used by the Roman legions were short and strong, with a blade seldom exceeding nineteen inches in length, but two-edged, and calculated both for the cut and the thrust. The British swords, called *spathæ*, were large, long, and heavy; and the Saxon and the Norman partook of the same character. The ancient practice of the weapon was probably carried to its greatest perfection amongst the Romans, whose partiality for gladiatorial exhibitions formed a remarkable feature of their character. The various and complicated methods of combat in which this celebrated people took delight are either alluded to or described by most of their writers, particularly by Livy, Juvenal, Seneca, and Suetonius.

The history of the modern small-sword or rapier is involved in some obscurity. The latter term, though now considered as synonymous with the former, properly denotes a long, ordinary, old-fashioned, cutting sword. But modern usage has identified the expressions, and by a rapier is now always meant a sword for the thrust, in contradistinction to one constructed for cutting. The small-sword or rapier is undoubtedly very ancient, although there is reason to believe that it was not brought into general use until armour began to wear out of fashion. Since that time the art of fencing has always been considered as a gentlemanly accomplishment, and in many parts of the Continent it is cultivated with the greatest zeal and assiduity. Shakspeare, indeed, makes Hamlet, who lived at the court of Florwendillus, a fencer; but as our great dramatist has not been very careful in avoiding anachronisms, it may reasonably be doubted whether the small-sword has any claim to such antiquity. Some have maintained that the weapon was not used in England before the reign of Elizabeth; and Darcie (*Annals of Elizabeth*) informs us that one Rowland York, who appears to have betrayed Deventer to the Spaniards in the year 1587, was the first who brought into England "that wicked, pernicious fashion to fight in the fields in duels with a rapier called a tucke only for the thrust." Stowe also mentions that long tucks and long rapiers began about the twelfth or thirteenth year of Elizabeth, and that "he was held the greatest gallant that had the deepest ruffe and largest rapier. The offence," he adds, "to the eye of the one, and the hurt unto the life of the subject that came by the other, caused her majesty to make proclamation against them both, and to place selected grave citizens at every gate to cut the ruffes and breake the rapier's points of all passengers that exceeded a yard in length of their rapiers, and a nayle of a yard in depth of their ruffes."[1]

But at what time soever the small-sword came into use in this country, it is not surprising that, when once introduced, it should have been cultivated as the fairest and most equitable instrument of duelling. Before this period meetings for the purpose of single combat were utterly revolting to human nature. No regard was paid to equality of arms or numbers; advantages, however unfair, were seized whenever an opportunity offered; and the ferocious passions, instead of being curbed, had fuller scope given for their gratification. "The duellist of former times," says Sir Walter Scott, in a note to *The Lady of the Lake*, "did not always stand upon those punctilios respecting equality of arms, which are now judged essential to fair combat. It is true that in formal combats in the lists, parties were, by the judges of the field, put as nearly as possible in the same circumstances. But in private duels it was often otherwise." In the desperate combat which was fought between Quelus, a minion of Henry III. of France, and Antraquet, with two seconds on each side, and from which only two persons escaped alive, Quelus complained that his antagonist had the advantage of a poniard which he used in parrying, whilst his own left hand, which he was obliged to use for the same purpose, had been cruelly mangled. When he charged Antraquet with this odds, "Thou hast done wrong," answered the latter, "to forget thy dagger at home; we are here to fight, not to settle punctilios of arms." In another duel of a similar kind, however, a younger brother of the house of Aubange in Angoulême behaved more generously, and at once threw away his dagger when his antagonist challenged it as an undue advantage. Nevertheless, it would be difficult to conceive any thing more brutal and savage than the mode in which private quarrels were at this time conducted in France. Those who were most jealous on the point of honour, and who thence acquired the title of *raffinés*, did not scruple to avail themselves of every advantage of strength, numbers, surprise, and arms, in order to accomplish their revenge. See DUEL.

Brantôme, in his discourse on duels, informs us that the Italian masters of the science of defence made a great mystery of their art and mode of instruction; that they never suffered any person to be present except the scholar who was to be taught, and even examined beds, closets, and other places of probable concealment. The lessons of these teachers often gave the most treacherous advantages to their pupils; for the challenger having by usage a right to choose his weapons, frequently selected some strange and inconvenient kind of arms, the use of which he had practised under his instructor, and thus killed at his ease an antagonist, to whom, perchance, the weapon was presented for the first time on the field of battle. Nor can we doubt that the same, or even still more treacherous advantages, are taught by some Italian masters of the present day, especially when we learn, from an authentic publication of the life of a late pope, that in Rome upwards of a thousand persons annually fall victims to the stiletto, either by the hands of hired assassins, or in private quarrels. Dr Moore estimates the number of murders perpetrated by the dagger in Naples alone at not less than four hundred annually. Such are the cowardly and ferocious modes in which vengeance usually seeks its gratification amidst an enslaved and degraded people.

The practice of deciding duels with the sword, however, may be considered as now extinct in this country. When the rapier was looked upon as an indispensable part of a gentleman's dress, the facility of immediate rencounter which it offered gave occasion to frequent and dangerous brawls, by which the public tranquillity was disturbed, and the lives of peaceable citizens sometimes sacrificed. But still it may reasonably be doubted, whether the comparatively rare occurrence of duels since the introduction of the pis-

[1] In *The Two Angry Women of Abingdon*, a comedy printed in 1599, we find the following pathetic complaint: "Sword and buckler fights begin to grow out of use. I am sorry for it; I shall never see good manhood again. If it be once gone, this poking fight of rapier and dagger will come up; then a tall man, and a good sword-and-buckler man, will be spitted like a cat or a rabbit."

tol, has not been overbalanced by a long list of fatal results, not to mention amputated limbs and distressing mutilations. Be this as it may, however, the discontinuance of sword duels in England has, in a great measure, removed one of the chief objections against fencing; namely, that adroitness in the use of weapons creates a fondness for contention, and a disposition to indulge in violence and insult. Since arms have ceased to be worn, such an objection can no longer be urged against the art of defence; and it may perhaps be questioned whether it had much weight, even when arms formed part of the equipment of every one who called himself a gentleman. All parties were thus placed upon nearly an equal footing; and if turbulent characters went about armed, there was nothing to prevent the peaceably disposed from being as well provided as the brawlers, and also on a par with them in respect of skill in the use of weapons. If the thief makes use of a crowbar, the honest housekeeper has the protection of an iron bolt. The primary intention of fencing is the security of one's own person; and where the weapons and the art of using them skilfully were equally accessible to all, the evil disposed had no advantage, and therefore small temptation to indulge their turbulent propensities.

The practice of the foil in England, however, is now confined to the most laudable purposes, namely, the enjoyment of salutary recreation, and the acquisition of a graceful and unconstrained deportment. The beneficial effects of moderate fencing to persons of weak constitutions, or of studious and sedentary habits, have been attested by medical practitioners of the first eminence. On this subject the suffrages of the most distinguished members of the British schools of medicine and of surgery, which Mr Angelo has annexed to his engravings, illustrative of the fencing attitudes, seem completely decisive.[1] To the public speaker, also, the practice of the fencing-room has been found to impart an ease and freedom of gesture attainable perhaps by no other exercise, not excepting even the discipline of the ballet-master. A modern writer on the subject of delivery or elocution, gives it as his opinion that the use of the foil and the broadsword diffuses ease, elegance, and grace all over the body, and imparts to the look and gesture an appearance of intellectual vigour. It does more; it teaches invaluable lessons of patience and self-command, and contributes to discipline the temper, whilst it serves to develope the corporeal powers, and to strengthen them by unconstrained and salutary exercise. We may add here, that several works of merit have appeared on this subject; but the most valuable and complete one yet published is Roland's *Treatise on the Theory and Practice of the Art of Fencing*, Edinburgh, 1823; nearly all the others we have met with being deficient either in explanation or in practical utility.

Having already described the weapons used in fencing, we shall now proceed to give such definitions as appear to be requisite for conveying a general idea of the subject, referring the reader for the necessary details to the excellent work of Mr Roland, which will be found equally clear in its explanations, and comprehensive in its views of every branch of the art.

After the first positions have been acquired, the different modes of attack come to be considered. *Attacks* are made in three ways: first, by a quick thrust proceeding merely from the wrist, the arm at the same time being elevated and advanced, with the point directed towards the adversary's breast; secondly, by what is technically called an extension; and, lastly, by longeing and recovering. The *parades*, in which consists the defensive part of the art, naturally follow the attack. A parade is a defence of the body, made by an opposition of one's blade to that of an adversary, in such a situation as, upon his attack, to prevent the point of his sword hitting. The parades are eight in number, viz. six simple, and two round or counter parades, and they are called *quarte, tierce, circle, octave, prime, quinte*, and round or counter in quarte and tierce. When and how these parades are made in fencing may be learned by consulting Mr Roland's work (p. 32 et seqq.).

The next division of the subject includes *straight thrusts, simple disengagements*, and *bindings of the blade*. A *straight thrust* is used as an attack, when an antagonist, from his position on guard, leaves sufficient opening to enable him to be touched upon that side of the body on which blades are joined. When such an opportunity offers, the wrist must be suddenly raised, so as to bring the *forte* of one's sword to the *foible* of the adversary's; after which *longe* immediately on the same line to his breast, observing, however, to preserve a correct opposition. In fencing, *opposition* signifies the art of covering the body at the time of delivering a thrust, on that side where the foils happen to cross, in order to prevent an antagonist exchanging hits. The *disengagement* is made either as an attack, or as a return after defending one's-self from a thrust, and is executed both under and over the wrist or foils. A disengagement over the arm may be parried with tierce or prime, and, if made low, by the parade of circle; from the position of octave, by quarte, or, if the thrust be delivered low, by circle; from the position of quinte, by prime as the readiest defence, but quarte and tierce are also correct parades against this thrust. There are three different ways of *binding the blade*. Of these, *flanconnade* is the principal, as it is sometimes a safe attack when any other mode would be attended with considerable danger; it is also made as a *riposte*. The attack of flanconnade is commenced when the blades are joined in quarte, and it is parried either by octave or quinte, or by the parade of quarte. The return over the arm, after the parade of circle, is parried by prime or tierce, or by changing quickly to the counter in quarte. The return over the arm, after the parade of prime, is parried by prime or tierce, or, if made at a considerable distance, by the counter in quarte.

In fencing there are a great variety of *feints*, which it is not easy to describe intelligibly without figures. A *feint* is an intentional movement made to deceive an adversary. All thrusts, therefore, may, strictly speaking, come under the definition of feints, as the fencer's object, in all his attacks, is to deceive his antagonist. For the sake of convenience, however, straight thrusts and simple disengagements have been arranged under a separate head. In executing the feint called *one, two*, inside of the arm, supposing the adversary's body to be covered in quarte, the parade of tierce is deceived; commencing from the outside, that of quarte is deceived; from the position of the circle the octave, and from that of the octave the circle is deceived.

[1] "Perhaps there is no exercise whatever," says Mr Roland, "more calculated for these purposes (developing and cultivating bodily strength and activity) than fencing. Riding, walking, sparring, wrestling, running, and pitching the bar, are all of them certainly highly beneficial; but, beyond all question, there is no single exercise which combines so many advantages as fencing. By it the muscles of every part of the body are brought into play; it expands the chest, and occasions an equal distribution of the blood, and other circulating fluids, through the whole system. More than one case has fallen under the author's own observation, in which affections of the lungs, and a tendency to consumption, have been entirely removed by occasional practice with the foil; and he can state, upon very high medical authority, that since the institution of a *Salle d'Armes* at Geneva, scrofula, which was long lamentably prevalent there, has been gradually disappearing." (*Theory and Practice of Fencing*, p. 163.)

This feint, if made inside the arm, is parried by the parade of quarte, or by the counter in tierce, made upon an opponent's second disengagement; upon the outside of the arm, by tierce, prime, or the counter in quarte; and from the position of the octave, by octave or quinte. The feint *one, two*, is likewise made as a return after the parade of quarte or tierce, or sometimes after that of circle or octave. The *cut and disengage* is a species of *one, two*, in making which from the position of quarte, an adversary's parade of tierce is deceived, and from the position of tierce his parade of quarte. *Cut and disengage*, if made inside of the arm, is parried by quarte, or the counter in tierce; if outside, by tierce or counter in quarte. *Feint seconde* is another feint very nearly resembling *one, two*, and is generally made as a return after the parades of tierce, prime, or quinte. In this feint the octave or quinte is deceived; and it is parried by tierce, prime, or quarte, the two former being the readiest where quinte is the parade deceived, but if the feint has been answered with octave, the thrust must then be parried with quarte. The feint *one, two, three*, is made on either side of the blade, upon precisely the same principles as *one, two;* the only difference between them consisting in making one disengagement more in the latter than in the former movement. The *cut and one two* is a species of *one, two, three*. These feints, if made over the arm, are parried with the simple parade of tierce; if on the inside, with simple quarte. The other feints are, *doubling*, which, *mutatis mutandis*, is executed upon precisely the same principles; *one two and deceive the circle*, executed from the inside position of quarte; *one two and deceive the counter*, which may be made from either side of the blade, but is most frequently used commencing from the position of tierce; *feint flanconnade*, which can be commenced only from the engagement of quarte; *feint one two and deceive octave*, which is commenced either from the outside or inside engagement; *feint seconde and deceive quarte*, which is always commenced from the outside engagement, whether made as an attack or a return; *feint seconde and deceive tierce*, which differs from the preceding only in the last disengagement; *one two and deceive quarte from the position of the circle*, when the first disengagement is made over the adversary's wrist towards the body under the arm, and the second over the wrist towards the inside of the body; and *doubling on both sides of the arm*, which is too complicated a feint to be frequently used in actual fencing, because it is difficult to follow the adversary's sword with certainty through many different parades, and there is much danger of *time thrusts* upon feints which consist of so many disengagements.

Time thrusts are so called because the success of these movements depends entirely upon their being executed at the exact moment of time employed by the adversary in planning or in executing his attack; and, when made correctly, they are by far the most scientific movements in fencing. There are two sorts of time thrusts, in the execution of one of which it is necessary that the blades should cross each other, but for the completion of the other it is not absolutely necessary that the blades should even meet. Those time thrusts in the execution of which the blades cross are more scientific, and expose the fencer less to exchanged hits. There are two time thrusts *in opposition;* one the *time over the arm*, and the other the *time in octave*. The former is applicable to all thrusts, however simple or complex the feint may be, provided the longe is made upon the outside; whereas all longes directed to the inside of the body, or under the arm, are exposed to the time in octave; and thus almost every thrust made in fencing affords an opportunity for one or other of these two movements. Those time thrusts in which the opposition is not essential are made upon incorrect movements of the adversary, when he exposes himself by the wideness of his attacks, or by quitting the blade in a dangerous position, or by making too many disengagements in his feints, or by giving a variety of openings which the judgment of the fencer must determine how he is to take advantage of. This thrust is practised almost entirely upon irregular attacks, and requires great caution to be observed. It has been already stated, that time thrusts in opposition, when correctly made upon good attacks, are, perhaps, the finest movements in fencing; but young fencers should nevertheless attempt them very seldom, from the danger of misjudging the attack, and thus exposing themselves to the certainty of being hit. And the time out of opposition is attended with still greater hazard, as its success depends rather upon the wideness and irregularity of an adversary's movements, than on the security of one's own situation afforded by the opposition in the former species of time thrust.

When fencing was comparatively little known, it was thought necessary that there should be some intermediate practice for the pupil between the lesson of the master and his making the assault; for which purpose, it appears, he was taught to longe, at a proper distance, at the wall. This was called by the French *tirer au mur*, and was considered as useful for planting the learner well upon his legs, accustoming him to measure distance correctly, and causing his motions, in making his extension and longe, to follow one another in the proper succession. But as the art became better understood, observation induced masters to place pupils together for their mutual advantage, the one to attack by simple disengagements, the other to parry by quarte and tierce alternately; and this practice, from its origin, was for a considerable time called *tirer au mur*, a denomination which it still retains amongst fencers of the old school. It is now, however, generally known by the denomination of *quarte and tierce*, and, in its improved state, is not merely intended as an exercise for the scholar, but also as a graceful display of the principal motions of fencing; for which reason it should be invariably practised before commencing the assault, and in fencing before company it is never dispensed with. Quarte and tierce appears very simple in its execution, yet it is exceedingly useful to fencers in all stages of their progress, and difficult to acquire with such correctness that all its movements shall take place in their proper succession, and be made with the grace and precision characteristic of a good fencer. For a description of the method of thrusting quarte and tierce, we must refer the reader to the fifth chapter of Mr Roland's work, section first. The *counters* is also a practice of importance to young fencers, and should consequently be attended to by them.

In the language of the fencing-room, making the *assault* and *playing loose* are synonymous, signifying the practice of attack and defence, or, in other words, a just application of the lessons received, which, in fact, ought to be done as correctly as if with sword in hand. In the assault, the mere movements should be almost mechanical; for the mind being wholly employed in discovering and counteracting the designs of the adversary, as well as in concealing its own, the hand should, on the proper opportunity being given, instantly execute that which the mind conceives, without any consideration of the manner in which the particular motion is to be made, as loss of time would most probably prove fatal to its success. The rules to be observed are few and distinct. The first thing which the attention of a young fencer should naturally be directed to is, the most secure manner in which he can come into the position of the guard, when opposed to an adversary ready to take every advantage of his inexperience. Whilst advancing into distance, it is also an object of importance to have one side of the body secured by the position, particularly that side to which the antagonist's blade is opposed; so that, if he commence an attack during this movement, he must quit the blade in or-

der to direct his thrust or feint at any opening afforded him by the position of his opponent; and the opportunities of attack being few, his designs will thus be the more easily discovered. In short, the commanding an opponent's blade almost obliges him to effect some change in the relative situations of the contending parties, before he advances into distance; and as the necessity of such previous movement must be foreseen, any attempt of this kind is favourable for making an attack on him. And, generally, whilst standing in the position of the guard, it is an advantage to have one side of the body covered, and to command the foible of the adversary's blade. Straight thrusts and simple disengagements, executed with quickness and vigour, should frequently be attempted, even though they do not succeed in hitting; and this counsel should be particularly attended to in fencing with a stranger. Quick simple thrusts are almost the only certain way of ascertaining his favourite parades, and consequently of knowing by what feints to attack him with a probability of success. The suddenness and rapidity of the attack will inevitably extort from him the secret of his favourite defence.

Many masters of the old school, and some, too, of the present day, have treated *disarming* as a matter of importance in the art; but, from its inutility, not to mention danger, in the field, it is now considered by the highest authorities on the subject as incompatible with good fencing. Mr Roland, in the work already referred to, shows by what methods this may be accomplished, and at the same time demonstrates the utter uselessness of the trick, for it is no better. The only advantage of disarming indeed is that of annoying the person disarmed; for, sword in hand, it is rendered nugatory by the use of a sword-knot, with which, it may be presumed, every person at all acquainted with the weapon will take especial care to fasten it to his wrist in a serious affair. As the manœuvre of disarming may therefore be defeated by the most ordinary precaution, attempting it can serve no other purpose than to make one play heavily and unpleasantly; whilst, from the strength it requires for the execution of its movements, it takes from the necessary quickness, and affords an adversary favourable moments of attack during the time an attempt is being made to bind his blade. In short, disarming is considered as characteristic of unskilful fencing; since perfection in the trick can only tend to render fencing disagreeable with the foil and ineffectual with the sword. We may add, that *volting, demi-volting, pirouetting*, parrying with and opposing the left hand, are manœuvres now totally disused in fencing.

As far back as 1692 a very curious book on the subject of fencing was published by Sir William Hope; it is now very scarce. In 1780 a Lieutenant M'Arthur published a work on fencing, which he dedicated to the Duke of Argyll, and which, we believe, is considered as a respectable performance. But since the latter period nothing worth noticing appears to have been written on the subject, with the exception of Angelo's book, illustrated by engravings, and the works of the two Rolands; of these, the most complete and satisfactory is Mr George Roland's *Treatise on the Theory and Practice of Fencing* above referred to. The only standard French works on the subject are, a Treatise by M. Danet, director of the royal academy of privileged fencing-masters; and one by M. Laboissier; both works of great merit, and highly esteemed. (J. B—E.)

FENELON, François de Salignac de Lamotte, was descended of an ancient and illustrious family, and born at the castle of Fénélon in Périgord, on the 6th of August 1651. Under the eyes of a virtuous father, he advanced in his literary studies with equal rapidity and success; and being from childhood nurtured in classical antiquity, and in particular familiarised in his solitude with the masterpieces of Grecian genius, his taste was formed on the purest models, whilst his benign genius was simultaneously developed. Called to Paris by his uncle, the Marquis of Fénélon, to complete his philosophical studies, and commence the course of theology requisite for the vocation to which he was destined, he, at the age of fifteen, underwent the same trial as Bossuet, and preached before an auditory, less distinguished, perhaps, than that which assembled in the hôtel de Rambouillet, but still highly respectable, who listened to him with a mixture of surprise and admiration. But this premature reputation rather alarmed than gratified the Marquis of Fénélon, who, in order to withdraw the young apostle from the seductions of the world and of glory, placed him in the seminary of St Sulpice. In this retreat Fénélon imbibed the evangelical spirit, and acquired the friendship of the virtuous Tronson, the superior of the establishment; and here also he received holy orders. About this time his religious fervour inspired him with the design of devoting himself to the missions in Canada. But being thwarted in this scheme by the apprehensions of his family and the weakness of his constitution, he soon turned his regards towards the missions of the Levant, particularly Greece, where the sacred and the profane, St Paul and Socrates, the church of Corinth, the Parthenon, and Parnassus, equally invited his poetical and religious imagination. Fortunately for the Catholic church and for France, however, this project also misgave; and Fénélon, diverted from distant missions, devoted himself to an apostleship, which he thought not less useful, namely, the instruction of the *Nouvelles Catholiques*, or newly-converted women in Paris. The duties and cares of this employment, in which he buried his genius during ten years, prepared him for the composition of his first work, entitled *Traité de l'Education des Filles*, a masterpiece of delicacy and of reason, which has not been equalled by the author of *Emile* and painter of Sophie. This work was intended for the Duchess of Beauvilliers, the pious mother of a numerous family. In the modest obscurity of his ministry, Fénélon had already formed with the Dukes of Beauvilliers and of Chevreuse that virtuous friendship which resisted equally the seductions of favour and the frowns of disgrace, the smiles of the court and the decree of exile. But in the case of Bossuet he met with an attachment which was destined to be much less durable. Admitted into familiarity with this great man, Fénélon studied his genius and his life; and the example of Bossuet, whose polemical religion exercised itself in controversies and conversions, probably suggested to him the *Traité du Ministère des Pasteurs*, a work in which he combats the heretics with a moderation which formed no part of the character of his illustrious model. The subject, the merit of this work, and the all-powerful suffrage of Bossuet in its favour, induced Louis XIV. to confide to Fénélon the charge of a new mission to Poitou. The rigorous uniformity which the French monarch was desirous of establishing in matters of religion, and the resistance which sprung from the oppressive measures adopted for this purpose, often obliged the monarch to cause his missionaries be supported by troops. Fénélon, however, not only rejected peremptorily the co-operation of the dragoons, but even reserved to himself the choice of the ecclesiastical colleagues who should share with him in the ministry of persuasion and gentleness. He converted without persecuting, and made the faith of which he was the apostle an object of love instead of hatred. The importance which was then attached to such missions fixed all eyes upon Fénélon, who had so happily acquitted himself of that entrusted to his care.

A great object was now presented to his ambition and his talents. The dauphin, grandson of Louis XIV., had

at length passed the period of childhood, and the king was looking out for a person to whom the education of the young prince might be confided. This was in the year 1689. By the favour of Madame de Maintenon, virtue obtained the preference in this appointment. M. de Beauvilliers was named governor, and he recommended to the king Fénélon as preceptor of the young prince. These virtuous friends, seconded by the attentions of men worthy of imitating them, commenced the task of educating the future king; and history attests that there was never seen a more perfect concurrence of principle and exertion. But Fénélon, by the natural superiority of his genius, formed the soul of this reunion; it was he who, transported by the hope of one day realizing the *beau ideal* of a prince on the throne, and viewing the happiness of France as in a great measure dependent on the education of its future sovereign, destroyed with admirable art all the dangerous germs which nature and the premature sentiment of power had implanted in his youthful breast, and gradually moulded an almost indomitable character to the habit of the most salutary virtues. This system of education, precious vestiges of which remain in some of the writings of Fénélon, appears to have been a masterpiece of that genius which devotes itself to advance the happiness of mankind. When brought into the midst of the court, Fénélon, without intermingling in its intrigues, secured general admiration by the graces of his brilliant and ready wit, and the charm of his noble and eloquent conversation. In his character the apostle and the great lord seemed to be strangely united. Imagination and genius escaped him on all occasions; and the most refined politeness at once embellished and rendered pardonable in the eyes of courtiers, the ascendency of his talents. This personal superiority indeed excited much more admiration than even the writings which proceeded from his pen, and, at the period of his reception in the Academy, was made the subject of eloquent commendation. "On sent," says La Bruyère, writing of him soon afterwards, "la force et l'ascendant de ce rare esprit, soit qu'il prêche de génie et sans préparation, soit qu'il prononce un discours étudié et oratoire, soit qu'il explique ses pensées dans la conversation; toujours maître de l'oreille et du cœur de ceux qui l'écoutent, il ne leur permet pas d'envier ni tant d'élévation, ni tant de faculté de delicatesse de politesse." This ascendency of virtue, of grace, and of genius, which excited in the hearts of the friends of Fénélon a tenderness mixed with enthusiasm, and which had even won Madame de Maintenon, in spite of her distrust and reserve, proved altogether unavailing against the prepossessions of Louis XIV. This monarch no doubt esteemed the man to whom he had confided the education of his grandson, but he never had any relish for his society. It is supposed indeed that the brilliant and ready elocution of Fénélon was distasteful to Louis, intolerant as he was of any sort of pre-eminence except his own. But if we cast our eyes on the letter in which Fénélon, in an expansion of confidence, informed Madame de Maintenon "that Louis XIV. had no idea of his duties as a king," we shall probably find, in the expression of this honest but uncourtly opinion, a better explanation of the aversion of a monarch accustomed to adulation, than in any supposed jealousy of the superiority of his conversational powers. Fénélon passed five years in the eminent situation of preceptor to the dauphin, without asking or receiving any thing; and, indeed, during his residence at court he had preserved the most irreproachable disinterestedness. Louis XIV. however, who knew how to recompense merit, even though its possessor might not be personally agreeable to himself, wished to repair this oversight, and, in 1694, named Fénélon Archbishop of Cambrai.

But at this moment of favour and prosperity his credit was destined to receive a blow, which would have inflicted a mortal wound on a less inviolable reputation. Fénélon, whose natural temperament disposed him to cherish a lively and spiritual devotion, had for some time fancied that he recognised some of his own principles in the mouth of a pious enthusiast, who, no doubt, had great talents for persuasion, since she obtained an extraordinary influence over several superior minds. Madame Guyon, writing and discoursing on grace and on pure love, at first persecuted and arrested, soon afterwards admitted into the intimate society of the Duke of Beauvilliers, received by Madame de Maintenon, and authorized to disseminate her doctrine in St Cyr, then suspected by Bossuet, arrested anew, interrogated, and condemned, served as a pretext for the disgrace of Fénélon. The inexorable Bossuet, who loved not the mystical subtilties and refinements concerning divine love, with which the lively and tender imagination of Fénélon was captivated, wished to bring it about that the new Archbishop of Cambrai should himself condemn the errors of a woman who had been his friend. Fénélon, however, refused, both from conscience and delicacy, to gratify his antagonist in this particular. Fearing to compromise opinions which were dear to him, wishing to exculpate the pietism of Madame Guyon, whose only offence appeared to consist in some venial exaggeration about the love of God, and perhaps also shocked at the theological haughtiness of Bossuet, who pressed upon him as if for the purpose of proselytism, he stood upon the defensive, and published his *Maximes des Saintes*, which may be regarded as an indirect apology for, or even as a subdued exposition of, the principles of Madame Guyon. In an age when a religious opinion was a political event, the first appearance of this work excited murmurs of astonishment; and all those who had been secretly envious of the genius and the promotion of Fénélon, declared loudly against the errors of his theology. Bossuet, a man incapable of indulging mean or unworthy sentiments, but at the same time inflexible, impatient of contradiction, and regardless of all external observances, when he believed the faith to be compromised, denounced to Louis XIV. in the midst of his court, the alleged heresy of the Archbishop of Cambrai; and at the moment when this attack was made upon Fénélon, the burning of his palace at Cambrai, and the consequent loss of his library, manuscripts, and papers, put his patience to a new trial, yet only drew from him the touching remark, "It is better that the fire should have consumed my dwelling than the cottage of a poor labourer." Nevertheless Bossuet, committed by his declaration to the king, prepared to pursue his rival, and seemed eager to extort from him a recantation; whilst, on the other hand, Madame de Maintenon, hitherto the friend and protectress of Fénélon, treated him with the greatest coldness. In the mean time Fénélon submitted his book to the judgment of the holy see. Bossuet, however, having already composed remarks, in which bitter and vehement censure is surrounded with ostentatious expressions of friendship and regret, proposed a conference; but this Fénélon declined, preferring to defend his book at the tribunal to which he had appealed. It was then that he received orders to quit the court and retire into his diocese; a circumstance which occasioned great grief to the Duke of Burgundy. The cabal wished to profit by the fall of Fénélon to overthrow the Duke of Beauvilliers; but the latter was saved by his own virtuous conduct; for his devotion to the cause his unfortunate friend interested the generosity of Louis XIV. and their design miscarried. Notwithstanding the evident desire of this monarch, however, the court of Rome hesitated to condemn an archbishop so illustrious as Fénélon. But the repugnance evinced by Innocent VIII. only served to stimulate the talents of the accuser and accused; and, whilst

the judges (a commission consisting of ten cardinals) remained undecided, the writings of the two adversaries succeeded one another with prodigious rapidity. The contest had, in fact, now changed its character. After having exhausted the dogma, Bossuet threw himself upon the facts; and the *Relation du Quiétisme*, written with equal spirit and malignity, seemed calculated to involve Fénélon in a portion of the ridicule which inseparably attached to Madame Guyon. The Abbé Bossuet, an unworthy nephew of the Bishop of Meaux, extended still further these personal inculpations, and, having collected some odious rumours, sought to impeach the purity of Fénélon's character. Never did the indignation of a virtuous and calumniated spirit display itself in greater eloquence. Fénélon, in his defence, demolished these vile accusations; and it required new letters from Louis XIV. prepared by Bossuet, and new intrigues, carried even to the extent of menace, to extort from the court of Rome a reluctant condemnation, which, when obtained, was found to be softened both in the form and in the expressions.[1] But the long and glorious resistance of the Archbishop of Cambrai had exasperated to the utmost the resentment of Louis XIV.; and the hesitation of the court of Rome to condemn him rendered his disgrace at that of France more irrecoverable than ever. When the brief, so long delayed, and obtained after so much discussion and intrigue, at length arrived in 1699, Fénélon hastened to subscribe it, and to ratify his own condemnation by a mandatory letter, conceived in the most touching and simple language, although Bossuet did not fail to discover in it much parade and ambiguity.[2]

The modest submission of Fénélon, his silence, his episcopal virtues, and the admiration which these had inspired, would not, in all probability, have re-opened to him the doors of the court of Louis XIV.; but an unexpected event, which occurred at this time, served to irritate that monarch more than ever against him. The *Télémaque*, composed several years previously during the period of his favour, was published some months after the affair about Quietism, through the infidelity of a domestic who had been employed to transcribe the manuscript, and who, it appears, had contrived to take a copy for himself. The work, though suppressed in France, was reproduced by the presses of Holland, and obtained throughout all Europe a success which malignity rendered injurious to Louis XIV., by seeking in it allusions to the conquests and misfortunes of his reign. This prince, who had always disliked the political notions of Fénélon, and had even described him as "un bel esprit chimérique," regarded the author of *Télémaque* as a detractor of his glory, who to the guilt of ingratitude added the more irritating injustice of satire. There cannot be a greater absurdity, however, than to construe this production as a political satire, or to seek in it for allegorical and premeditated censure of Louis XIV.; all the details being, in fact, combined in the best manner imaginable for disconcerting allusions, and avoiding as much as possible the inevitable fatality of resemblances. We are convinced indeed that this generous precaution occupied the mind of Fénélon whilst composing the work, and that, writing for the happiness of nations, he selected those primitive manners, and antique forms of society, which are the most remote from the picture of life presented by modern Europe, but which served equally well to embody his poetical conception, and to suggest those instructive lessons which it was his grand object to inculcate. Besides, why should he have thought of representing Louis XIV. under the character of the imprudent Idomeneus, or that of the sacrilegious Adrastus, rather than under the masterly delineation of the great and virtuous Sesostris?

Fénélon, however, soon learned the indelible impression which *Télémaque* had produced upon the heart of the king; and, resigned to his banishment from court, which he had sometimes the weakness to call his disgrace, he sought to console himself for the loss of the royal favour by endeavouring to diffuse happiness around him in his retreat at Cambrai. The sanctity of the ancient bishops, the severity of the primitive church, the attraction of the most indulgent virtue, the charm of the most captivating politeness, the utmost eagerness to fulfil even the humblest duties of the ministry, indefatigable goodness, inexhaustible charity; such are the traits of Fénélon's character as delineated by an eloquent and virtuous prelate, who knew him well, and who dwells with enthusiasm on the picture which he has drawn of his illustrious friend. The first care of Fénélon was to instruct the clergy of a seminary which he had founded; nor did he even disdain to teach their catechism to the children of his diocese. Like the bishops of ancient days, he often ascended the pulpit of his cathedral, and, trusting at once to his faith and his feelings, spoke without preparation, diffusing all the treasures of his natural eloquence. When the misfortunes of the war, which chastised the ambition of Louis XIV., brought the allied army into the diocese of Cambrai, the occasion called for new efforts and new sacrifices upon the part of the good archbishop, who, by his wisdom, his firmness, and the nobleness of his language, inspired the hostile commanders with a salutary respect for the unfortunate provinces of Flanders. Marlborough and Eugène indeed were worthy of listening to the voice of the great man whose genius and worth they so well appreciated.[3]

The situation of Cambrai on the frontiers of France attracted to the archiepiscopal residence many strangers, none of whom approached or quitted its lord without being affected with a sort of religious admiration. Not to mention Ramsay, who passed several years under his roof, the celebrated Marshal Munich, and the unfortunate Chevalier de St George, called James III., experienced the delight of his society, and derived instruction from his superior sagacity. By the wise counsels which he gave to James III., Fénélon showed his high esteem for the English constitution, powerful alike against despotism on the one hand, and anarchy on the other. The archbishop was exempt from that narrow patriotism which undervalues whatever exists beyond the frontiers. His virtuous and benevolent spirit

---

[1] The interest of this discussion, so foreign to the ideas of our age, has been admirably preserved in the excellent *History of Fénélon* by M. de Bausset, in which will be found an animated picture of the court of Rome and of the court of France, which took such a lively interest in this frivolous question, which, however, was aggrandized by the opinions of the time, and the prodigious talents of the rival disputants.

[2] Pope Innocent, who appears to have heartily disapproved the violent proceedings adopted against the Archbishop of Cambrai, wrote thus to the prelates who had particularly distinguished themselves as adversaries of Fénélon: *Peccavit excessu amoris divini, sed vos peccâstis defectu amoris proximi;* one of the most pungent reproofs, perhaps, which is to be found in all history.

[3] It is now known that the *Vie du Prince Eugène*, though written as if it were an autobiography in the first person, is the production of the Prince de Ligne. In this clever performance, the veteran is made to speak thus of the great preachers of his time: "Quand Bourdaloue me fait tout craindre, Massillon me fait tout espérer. Nous sommes nés la même année, et je l'ai connu à son entrée dans le monde, parfaitement aimable. Bossuet m'étonne; Fénélon me touche. Je les avais vus aussi dans ma jeunesse; et Marlborough et moi, nous avons rendu *au dernier* tous les honneurs possibles, quand nous avons pris Cambrai." (*Vie du Prince Eugène*, p. 225. Paris, 1810, 8vo.)

concerned itself for the welfare of the whole human family. "I love my family," said he, "better than myself; I love my country better than my family; but I love the human race better than my country." The humanity of Fénélon was not, however, confined to exaggerated speculations and impracticable generalities, which always suppose great ignorance of the details of human affairs. His politics were not the dream of a virtuous but fanciful mind. He had seen and judged both the court and the world; he was acquainted with the history of all ages; and he was endowed with an independence of spirit which raised him above the prejudices of his age and nation. In the different memoirs which he addressed to the Duke of Beauvilliers may be seen proofs of the wisdom of his views respecting the greatest interests, particularly the succession to the throne of Spain, the policy best suited to Philip V., the views of the allies, the conduct of the war, and the necessity of peace. The disastrous war of the succession having brought the theatre of action near to the archiepiscopal residence of Fénélon, afforded him an opportunity, after ten years' absence, of seeing the young prince whom he had formed, and who had just assumed the command of the French troops. It cannot be disguised, however, that, in the command of armies, the pupil of Fénélon fell far below the promise of his youth and the opinion of France respecting him. The letters of the archbishop to the Duke of Burgundy, at this decisive epoch, evince a severe frankness, and show the ascendency which the master had acquired over the mind of the scholar; so much so, indeed, as to create a suspicion that the young prince, though well informed, docile, and virtuous, was of too timid a genius. In these letters also severe judgments are pronounced on all the generals who then formed the hope of France. Fénélon, in fact, though he possessed great sweetness of disposition, had not a little of domination in his character. His ideas were absolute and decisive; the promptitude and force of his mind rendered his judgments energetic and inflexible. But the continual attention which he gave to the political interests of France in no degree diminished his zeal for the affairs of religion and the church; and those who have been accustomed to honour him as a philosopher, will perhaps be surprised to find him entering into all ecclesiastical discussions with an ardour equal to that of Bossuet himself. When the unfortunate disputes about Jansenism were, after a long interruption, revived, Fénélon wrote against men who did not imitate him in his respect for the court of Rome, and he soon found himself engaged in a controversy scarcely less animated than that which had taken place concerning Quietism.

The courtiers supposed that in acting thus Fénélon had views of ambition and flattery. But if he had desired to regain the favour of the sovereign, he employed, about the same period, a much more effectual method for accomplishing his object, by feeding at his own expense the whole French army during the disastrous winter of 1709. His aim in both cases was to serve religion and his country. The same sentiments dictated the view which he presented the following year of the evils of France, and also the project of associating the nation with the government, by convoking an assembly of the notables, a proposition remarkable in itself, and still more so when considered in connection with subsequent events. In the memoir which contains the exposition of this scheme, Fénélon shows that he had rightly estimated the strength and the weakness of despotism, as well as the salutary power of liberty. Meanwhile, an unexpected event appeared to accelerate the moment when the counsels of Fénélon were to govern France. The grand dauphin died, and the Duke of Burgundy, long oppressed by the mediocrity of his father, saw himself all at once brought close to the throne of which he was heir, and to the king, whose stay and support he now became. His virtues, freed from a jealous tutelage, had at length scope for action; and the pupil of Fénélon showed himself worthy of his master. Full of hope and joy, the latter wrote to the young prince, who, according to St Simon, reigned in advance, "Il ne faut pas que tous soient à un seul, mais un seul doit être à tous pour faire leur bonheur;" language which, we believe, has but rarely been addressed to the heirs apparent of thrones. But whilst Fénélon was devising plans for promoting the welfare of France, and advancing the glory of its future sovereign, all his hopes were blasted by the sudden death of the young heir of the old king, who remained unshaken amidst all the humiliations of his glory, and all the disasters of his family. Fénélon survived this event some time, and, notwithstanding his grief, laboured to prevent the evils incident to a long and inevitable minority. In several confidential memoirs which he wrote on this subject, we discover the novelty of his political views, and that spirit of liberty which, in his age, was not the least of its innovations. One of these papers is devoted to a discussion of the probabilities of the guilt of the Duke of Orleans, and whether he was actuated by an ambition which required other crimes besides that which had been laid to his charge; a memoir in which, without dwelling upon all the horrors of the popular reports, he judges severely the scandalous profligacy of the Duke of Orleans, and condemns his vices in the tone and language which it became a Christian bishop to assume. The last public discussion in which Fénélon engaged related to the bull *Unigenitus*, which, as is well known, gave rise to much controversy, and occupied his attention towards the close of his life. Malignity has supposed that the zeal of Fénélon in this matter was sharpened by an old grudge against the Cardinal de Noailles; but when the conduct of this virtuous and excellent man seems to be authorized by his duty, it is not necessary to explain it by reference to his alleged weaknesses. Faithful above all things to his episcopal character, he conceived himself bound to combat errors which he considered as calculated to disturb the consciences of men, and to interrupt the repose of the church. But his wine of life was now upon the lees. His friends, like the travellers on the bridge in the Vision of Mirza, had dropped off one by one, till the Duke of Beauvilliers alone remained to him; and when the latter was also removed by death, Fénélon followed him to the grave at the brief interval of four months. This great and good man expired on the 7th January 1715, at the age of sixty-four; and his death, which a slight fall had accelerated, was, like his life, that of a virtuous and exemplary Christian bishop. In the *Dissertations* prefixed to this work (vol. i. p. 335) the reader will find the characters of Fénélon and Bossuet ably contrasted, by Sir James Mackintosh.

The following list of the works of Fénélon includes every thing of any consequence which proceeded from his pen: 1. *Traité de l'Education des Filles*, 1681 and 1687; 2. *Traité du Ministère des Pasteurs*, 1688, in 12mo; 3. *Explication des Maximes des Saints*, 1697, in 12mo; 4. *Aventures de Télémaque*, 1699, the editions of which are innumerable; 5. *Dialogues des Morts, composés pour l'éducation d'un Prince*, 1712, in 12mo; 6. *Dialogues sur l'Eloquence en général, et sur celle de la Chaire en particulier, avec une Lettre à l'Académie Française*, 1718, in 12mo; 7. *Examen de la Conscience d'un Roi*, 1734; 8. *Lettres sur divers sujets, concernant la Religion et la Métaphysique*, 1718; 9. *Démonstration de l'Existence de Dieu, tirée de la connaissance de la Nature, et proportionée à la faible intelligence des plus simples*, 1713, in 12mo; 10. *Recueil de Sermons choisis sur différents sujets*, 1710, in 12mo; 11. *Œuvres Spirituelles.* There is no very complete edition of the works of Fénélon. The clergy of France undertook one some years before the Revolution, and entrusted the preparation of it first to the Abbé Gallard, and afterwards to the Abbé de Querbeuf; but, from whatever cause, in this collection of the writings of Fénélon, which appeared at Paris in nine volumes 4to, 1787–1792, the reader will seek in vain for those

on Quietism and Jansenism, his *Explication des Maximes*, and his *Mandements*. In the edition of the *Œuvres de Fénélon*, published at Toulouse, 1809–1811, in nineteen vols. 12mo, the life of Fénélon by Querbeuf has been introduced, together with four *Instructions Pastorales*, and an *Abrégé des Vies des anciens Philosophes*, which are not contained in the former edition. Some years after the death of Fénélon there appeared *Recueil de quelques Opuscules de M. de Salignac de Lamotte-Fénélon, archevêque de Cambrai, sur différentes matières importantes*, in 8vo, a rare volume, which is precious as containing a detailed catalogue or notice of all his works, reprinted in the edition of *Les Aventures de Télémaque*, published at Lyons in 1815. The éloge of Fénélon by D'Alembert will be found in the *Histoire des Membres de l'Académie Française* (tom. i. and iii.) That of Laharpe gained the prize proposed by the Academy, whilst the abbé obtained the *accessit*. But the most complete biographical account of this illustrious man is that given by M. de Bausset, formerly bishop of Alais, in his *Histoire de Fénélon*, 1808, in 3 vols. 8vo, reprinted the year following with corrections and additions. (J. B—E.)

FENTON, Sir Geoffrey, an eminent writer and statesman during the reigns of Elizabeth and James I., and brother to Edward Fenton, the navigator, who accompanied Sir Martin Frobisher in his expeditions, and was afterwards sent out independently to endeavour to discover a north-west passage. Sir Geoffrey appears to have received a liberal education, and certainly gave many proofs of his acquaintance with ancient and modern learning. He is best known, however, for his translation of the *History of the Wars of Italy* by Guicciardini, which he dedicated to Queen Elizabeth. He also published, 1. Certain Tragical Discourses, written oute of French and Latin, 1567, in 4to; 2. An account of a dispute at Paris, between two Doctors of the Sorbonne and two Ministers of God's Word, 1571; 3. An Epistle, or Godly Admonition, sent to the Pastors of the Flemish Church at Antwerp, exhorting them to concord with other Ministers; translated from the original of Antonio de Carro, 1578; 4. Golden Epistles, containing variety of Discourses, both moral, philosophical, and divine, gathered as well out of the remainder of Guevara's works, as other authors, Latin, French, and Italian, 1577. The familiar epistles of Guevara had been published in English by Edward Fellowes, in 1574; but Fenton's collection consists of pieces not contained in that publication, and, like his translation of Guicciardini, has risen in public estimation since the language and literature of the Elizabethan age have been more generally studied. In the capacity of queen's counsellor or secretary, Fenton served for a considerable time in Ireland, where his conduct appears to have given great satisfaction to his royal mistress. To his honour be it stated, he took every opportunity of impressing on the mind of the queen the important truth, that the safety and glory of her government in that island depended on her subjects enjoying the protection of equal laws. He died at Dublin, Oct. 19, 1606. (J. B—E.)

Fenton, *Elijah*, an English poet of considerable note, was born at Shelton, near Newcastle-under-Line, in Staffordshire, on the 20th of May 1683. Being the youngest of twelve children, he was destined for the church as a profession; and with this view he was admitted a pensioner of Jesus College, Cambridge; but having refused to take the oaths to government, he was obliged to quit the university without a degree, and forced to trust to his abilities for a subsistence. His first employment promised more than it afterwards realized. He accompanied the Earl of Orrery to Flanders in the capacity of private secretary, and returned with his lordship to England in 1705. Being thus left without employment, he became assistant in a school at Headley, in Surrey, and was soon afterwards appointed master of the free grammar-school at Sevenoaks in Kent. In 1710 he was prevailed on to give up the drudgery of teaching for the worse drudgery of political dependence; Lord Bolingbroke, who had persuaded him to take this unwise step, having, with characteristic recklessness, neglected his interest, and left him disappointed and in debt. But not long afterwards he was appointed tutor to Lord Broghill, only son of the Earl of Orrery; and when this engagement expired, he was, on the recommendation of Pope, employed to give private instructions to Mr Craggs, secretary of state, who, feeling his own want of literature, was anxious, with the aid of such an instructor, to supply the deficiencies of his education. His next engagement was with Pope himself. The success of the translation of the Iliad having induced the latter to undertake that of the Odyssey, he, in order to lighten the task, resolved to engage auxiliaries; and, with this view, retaining twelve books for his own share, he distributed the remaining twelve between Broome and Fenton. Of these, according to Johnson and Warton, Fenton translated the first, fourth, nineteenth, and twentieth; though the Earl of Orrery has asserted that he translated double the number of books which Pope has acknowledged.[1] In 1723 his tragedy of *Mariamne* was brought out, and performed with such success that the author's profits are said to have amounted to nearly a thousand pounds. The poetical merit of this tragedy is considerable; but the diction is too figurative and ornate for a dramatic composition, and accordingly it has not retained its place on the stage. In 1727 Fenton superintended a new edition of Milton's *Poems*, to which he prefixed a life, of which Johnson has spoken with commendation; and in 1729 he published a splendid edition of Waller, with notes. The latter part of Fenton's life was passed in tranquillity. By the recommendation of Pope, Lady Trumbull appointed him tutor to her son, first at home and afterwards at Cambridge; and when he had acquitted himself of the duties of this office, she still retained him in her family as auditor of her accounts, in which capacity he seems to have enjoyed his ease, and found leisure to pay frequent visits to his literary friends in London. He died at East Hampstead, Berkshire, on the 13th of July 1730, and was interred in the parish church, where his tomb has inscribed on it an epitaph written by Pope. Fenton, naturally indolent, was capable of greater things than he performed. His reputation as a poet rests chiefly on his *Mariamne*, and his share in the translation of the *Odyssey*, which the readers of poetry have never been able to distinguish from the portion executed by Pope himself; but to his *Miscellaneous Poems*, published in 1717, he has been indebted for a place amongst the English poets in Dr Johnson's collection. Of his morals and conversation the account is uniform. "He was never named," says Dr Johnson, "but with praise and fondness, as a man in the highest degree amiable and excellent. Such was the character given of him by the Earl of Orrery, his pupil; such is the testimony of Pope; and such were the suffrages of all who could boast of his acquaintance." (J. B—E.)

FEOD, or Feud. See Feudal Law.

FEOFFMENT, in *Law* (from the verb *feoffare* or *infeudare*, to give one a fief), the gift or grant of any corporeal hereditament to another, by delivery of the possession of the hereditament conveyed and evidenced by an instrument in writing, without which, since the 29th Car. II., cap. 3, there can be no valid feoffment. This mode of conveyance is now seldom resorted to; the 8th and 9th Vict., cap. 106, sec. 2, having enacted that all corporeal hereditaments lie in grant as well as in livery of seisin, which was previously required to perfect the conveyance by feoffment, and a "grant" or *concessio* is now substituted.

FERALIA, in *Antiquity*, a festival observed by the

[1] In a letter to Mr Duncombe, Lord Orrery says, "His reward was a trifle, an arrant trifle. He has even told me that he thought Pope feared him more than he loved him. He had no opinion of Pope's heart; and declared him, in the words of Bishop Atterbury, '*Mens curva in corpore curvo.*'"

Romans on the 21st of February (Ovid says the 17th), in honour of the manes of their deceased friends and relations. Varro derives the word from *inferi*, or from *fero*, on account of a repast carried to the sepulchres of such as had that day the last offices rendered to them. Festus derives it from *ferio*, on account of the victims sacrificed. Vossius again derives it from the epithet *fera*, cruel, frequently applied to death. Macrobius (*Saturnalia*, lib. i., cap. 13) refers the origin of the ceremony to Numa Pompilius. Ovid, in his *Fasti*, goes back for its institution as far as the time of Æneas. He adds, that on the same day a sacrifice was performed to the goddess Muta, or Dumb; and that the persons who officiated were an old woman and a number of attendant young girls.

During the continuance of this festival, which lasted eleven days, presents were made at the graves of the deceased, marriages were forbidden, and the temples of the gods were shut. Whilst the ceremonies continued, it was imagined that the ghosts suffered no punishments in hell, but that their tormentors allowed them to wander round their tombs, and to feast upon the meats which their surviving friends had prepared for them. During the feralia public feasts were sometimes given to the people at the tombs of the rich and great, by their heirs or particular friends.

FERDINAND, a name common among the royal families of some of the European states. Of the most distinguished or notorious of those who have borne this title we may mention Ferdinand I. of Austria, younger brother of Charles V., born 1503, died 1564; his grandson Ferdinand II. of Austria, who came to the throne in 1619, and died in 1637. Of the Neapolitan Ferdinands may be noticed—Ferdinand I., natural son of Alfonso V. of Aragon and Sicily,—born in 1423, died in 1494; his grandson Ferdinand II., who died in 1496; Ferdinand III., who became Ferdinand V. of Spain and Ferdinand IV. of Naples, or I. of the united kingdom of the Two Sicilies, born 1751, died 1825. Of the Spanish Ferdinands the most noted was Ferdinand II. of Aragon, the husband of Isabella of Castile, born 1453, died 1516; by whose union the Spanish monarchy was consolidated.

FÈRE, LA, a fortified town of France, in the department of Aisne, situated on an island of the Oise, near its confluence with the Serre, 16 miles N.W. of Laon. It has a large arsenal, a school of artillery, a powder mill, and saltpetre works. Pop. 3129. La Fère was taken by the allies on 24th February 1814.

FERENTARII, in *Roman Antiquity*, light-armed troops who fought with missile weapons. See ARMY, *Roman*, vol. iii., p. 631.

FERENTINUM (now *Ferento*), in *Ancient Geography*, a city of Etruria, on the northern slope of the Ciminian hills, about five miles from Viterbo, and the same distance from the banks of the Tiber. It is only noted as the birthplace of the Emperor Otho, and as possessing a very old and splendid temple of Fortune.

FERENTINUM (now *Ferentino*), in *Ancient Geography*, a city of the Hernici, about 48 miles from Rome, in a S.E. direction on the side of a hill rising immediately on the left of the Via Latina. It appears to have been at one time a Volscian city, but soon after the defeat of that people by the Romans in B.C. 413 it was made over with the adjoining territory to the Hernici. In the war which this latter people waged with the Romans in B.C. 361 it was taken by the Roman consuls, but so leniently dealt with, that when the Hernici rebelled for the third and last time, Ferentinum was one of the three Hernican cities that refused to join the revolt. In consideration of this they were allowed by the conquerors to retain their own laws, which they preferred to the Roman code. After the social war, however, the Ferentines accepted the franchise. The ancient remains at Ferentino possess considerable interest. They consist chiefly of the old walls built somewhat in the cyclopean style, a kind of citadel on the top of the hill, on which the cathedral now stands, and various other portions of Roman buildings.

FERETRIUS, a surname of Jupiter, as the subduer of enemies, and to whom the Romans consequently offered the *spolia opima*.

FERG, or FERGUE, FRANCIS PAUL, a landscape painter, was born at Vienna in 1689, and there learned the first principles of his art. He successively practised under Hans Graf, Orient, and Thiele. The last of these, who was painter to the court of Saxony, having invited him to Dresden to insert small figures in his landscapes, Ferg repaired to that city, whence he proceeded into Lower Saxony, and painted for the Duke of Brunswick and for the gallery of Salzdahl. From Germany he passed over to London, where he might have lived in esteem and affluence, had he not, by an indiscreet marriage, involved himself in difficulties from which he was never able to extricate himself, and which, it is said, terminated only by his death from actual starvation. This pleasing artist, Walpole observes, had formed a manner of his own from various Flemish painters, though resembling Poelemburg most in the enamelled softness and mellowness of his colouring; but his figures are greatly superior, every part of them being sufficiently finished, and every action expressive. He painted small landscapes, fairs, and rural meetings, with much natural truth; his horses and cattle are not inferior to those of Wouwermans; and his buildings and distances seem to owe their respective softness to the intervening air, not to the pencil. More faithful to nature than Denner, he knew how to omit exactness when the result of the whole demanded less precision in parts. The greater number of his works are in London and Germany; and the price they now bear is the best proof of their real merit. He also etched well with aqua fortis; and his works of that description are highly esteemed by print-collectors.

FERGUSON, ADAM, LL.D., a distinguished philosopher and historian, born June 20, 1723, at Logierait in the Highlands of Perthshire, of which parish his father was minister. This excellent man had a numerous family, of whom Adam was his youngest son, by Mary Gordon, daughter of Mr Gordon of Hallhead, in Aberdeenshire.

It is believed that Adam received the first part of his education at the village school of his native parish, and thence he was removed to Perth, where he is said to have made uncommon progress in classical literature.

Towards the end of 1738 he entered the university of St Andrews. The Greek class in St Leonard's College was at this time taught by Mr Francis Pringle, the ablest Greek scholar Scotland then possessed; and in his class Adam Ferguson was enrolled as a *ternar*—that is to say, one who pays the lowest rate of fees. It has been alleged that he was admitted one of the foundation bursars, having stood first in the list of successful competitors; but if so, the victory was not very splendid, as, of the twelve who entered the class along with him, not more than eight (being of the denomination of ternars) could have been permitted to share in the contest. Ferguson appears to have acquired little more at this seminary than a high admiration of the Grecian and Roman literature, to the beauties of which he was more nearly introduced than he had hitherto been. He obtained the degree of master of arts May 4, 1742, when he had nearly completed his nineteenth year. In November of the same year he entered the divinity hall; and he studied also a year or two at Edinburgh; but there his attention appears to have been chiefly given to pursuits not immediately connected with his clerical views. In 1745, though he had studied divinity only one-half of the usual period, the General Assembly permitted his ordination by the presbytery of Dunkeld, on the representation that young Ferguson had

been pitched upon as the fittest person, from his knowledge of the Erse language, to fill the office of chaplain to the Highland regiment (the 42d) under the command of Lord John Murray. He continued attached to this regiment till 1757; about the beginning of which year he was elected keeper of the Advocates' Library, on the resignation of the celebrated David Hume; but this office he relinquished in about a year.

In the course of 1757 Ferguson rendered himself conspicuous by the interest he took in the success of the tragedy of *Douglas*, written by his familiar friend the Rev. John Home, and by his published defence of the *morality of stage plays*. When Home resigned his living in June of that year, Ferguson and he retired to Braid, in the vicinity of Edinburgh, and there spent several months in study, enlivened by the intercourse of friendship. Ferguson's campaigning experience appears to have given him a relish for a migratory life: he delighted particularly in taking occasional excursions to the Highlands, and rambling amidst the lakes and forests of Rannoch, or among his native hills. It was here that the lofty enthusiasm of his spirit was nursed and matured; and it may be said that the dignity and ease of manner for which he was distinguished above most of the literary men of his country, was acquired not so much in the intercourse of polished society, as in the wilds of Athole. To use his own expressive words:—"If I had not been in the Highlands of Scotland, I might be of their mind who think the inhabitants of Paris and Versailles the only polite people in the world. It is truly wonderful to see persons of every sex and age, who never travelled beyond the nearest mountain, possess themselves perfectly, perform acts of kindness with an aspect of dignity, and a perfect discernment of what is proper to oblige. This is seldom to be seen in our cities or in our capital; but a person among the mountains, who thinks himself nobly born, considers courtesy as the test of his rank."

In 1759 Ferguson succeeded Dr John Stewart as professor of natural philosophy in the university of Edinburgh. He had paid comparatively little attention to physical science; yet with only four months to prepare his course, he acquitted himself to the satisfaction of all.

Ferguson was appointed in 1764 to the chair of moral philosophy, which had long been a favourite object of his ambition. He entered on his new duties with a degree of spirit and activity from which the most splendid results were to be anticipated. In his discourses he seldom had recourse to notes, but trusted to his memory;—a method of lecturing liable to abuse, and generally unsatisfactory to the student, though in his hands happily executed. His class was crowded by great numbers of gentlemen of high rank and official station, as well as by younger students. Within little more than a year after he commenced his labours as a lecturer on morals, he published his *Essay on the History of Civil Society*, which was received with great approbation. Mr Hume, in a letter, congratulates the author on the success of the book, adding that he had "met with nobody that had read it who did not praise it." About this time Ferguson married Miss Burnet, a young lady nearly connected with his mother's family, and still more nearly related to his intimate friend Dr Black. Soon afterwards he began to cultivate a farm in the parish of Currie, and, at a considerable sacrifice of private interest, gratified his taste for improvement, by transforming a barren heath into a scene which became distinguishd for beauty and fertility. All this time, however, he continued to conduct the business of his class with unremitted diligence, but seized every interval of leisure to collect materials for a history of the Roman commonwealth. Whilst thus engaged, he was solicited by the guardians of Charles, Earl of Chesterfield, to superintend that young nobleman's education, which had been much neglected. The negotiation was conducted through the mediation of Dr Adam Smith; and Ferguson was persuaded to accept the charge, though it necessitated the suspension of his lectures in the university; but having obtained leave of absence for the next session, he joined his young charge at Geneva in May 1774. This connection, however, terminated about twelve months afterwards. In the meantime he had very nearly been deprived of his office in the university, the town-council before the conclusion of the session having thought fit to declare the chair vacant. His friends in the university, particularly Drs Robertson, Blair, and Black, were exceedingly indignant at this decision, and endeavoured to get it reversed. As the council, however, seemed to have determined to fill up the place by a new election, it became necessary to apply to the Court of Session to put a stop to their proceedings.

After his return, he continued, as formerly, to divide his time between his literary and agricultural pursuits, and engaged occasionally in the political controversies which agitated the country during the progress of the American war. Besides his pamphlet in answer to Dr Price's observations on liberty, he communicated his views from time to time to Sir William Pultcney, and other members of parliament; and when it was resolved by government to send out commissioners to quiet the disorders in the colonies, he was appointed secretary to the commission. It is well known that the commissioners returned without accomplishing the object of their mission; but they had an opportunity of acquiring more useful information of the state and temper of the country than government had received in all the previous course of the contest. Whilst Dr Ferguson was absent during the session 1778-1779, his place was supplied by Dugald Stewart, who, about five years afterwards, was destined to succeed him in the chair of moral philosophy.

In 1780 Dr Ferguson was seized with an attack of apoplexy, which, though not violent, was nevertheless sufficient to alarm his friends. This formidable affection did not in the slightest degree impair the force of his understanding; and so abstemious did he afterwards become, as not only to secure himself against the recurrence of the disease, but to enjoy almost uninterrupted health for more than thirty years. As he could not now venture to lecture extempore as formerly, he wrote out his course, availing himself of the notes taken by some of the more intelligent of his former pupils. He was now (1783) busy in carrying his great historical work through the press. This was the *History of the Progress and Termination of the Roman Republic*, 3 vols. 4to; a book which not only delights by the clearness of its narrative and the boldness of its descriptions, but instructs and animates by profound and masterly delineations of character, as well as by the philosophical precision with which it traces the connection of events.

No longer able for the fatigue of public teaching, in the following year he resigned his chair in the university. He was succeeded by Dugald Stewart, then professor of mathematics; and an arrangement was made by which Dr Ferguson retained the salary. He now proceeded to revise the notes of his lectures on ethics and politics; and in 1792 they were published under the title of *Principles of Moral and Political Science*. Though composed under disadvantageous circumstances, this work contains an admirable view of the systems both of ancient and modern philosophers, particularly respecting the foundations of moral approbation, and the sources of private happiness and public security. Dr Ferguson, now in his seventieth year, resolved to pay a visit to the ancient metropolis of the world. He passed a short time at some of the principal cities of Europe, Berlin, Vienna, Florence, Naples, and Venice, and resided part of the winter of 1793 at Rome, in all of which places his reception was extremely flattering. He was elected a member of the Academy of Berlin, as well as of other learned societies. Upon his return to Britain in 1794, he took up

Ferguson. his residence at Nidpath Castle in Tweeddale, from which he soon removed to Hallyards on Manor Water, and in this agreeable retreat he spent the next fourteen years of his life. At last, however, when his sight and his hearing had in a great measure failed, he took up his abode at St Andrews. Here his strength gradually declined, but the vigour of his mind continued unimpaired to the last hour of his life. He died, after a short illness, Feb. 22, 1816, in the ninety-third year of his age, leaving three sons and three daughters.

In the various situations which it was his lot to occupy, he had uniformly conducted himself with a dignity and decision which bespoke the elevation and force of his mind. In private life his conversation was easy and elegant, and, among his intimate friends, enlivened by a fascinating gaiety and refinement of humour.

Among his writings are—*The Morality of Stage Plays seriously considered.* Edinb. 1757. *A Pamphlet on the Militia.* Lond. 1758. *The History of the Proceedings in the case of Margaret, commonly called Sister Peg.* Three editions. Lond. 1762. Another, 1777. *Analysis of Lectures on Mechanics.* Edinb. *An Essay on the History of Civil Society.* Lond. 1767. This book has passed through many editions, and has been translated into almost all the European languages. *Analysis of Pneumatics and Moral Philosophy.* Edinb. 1766. 12mo. *Institutes of Moral Philosophy*, 1769; 319 pages 12mo. Another edition, 1773; 294 pages. A translation of this edition into French was published at Geneva in 1775, and revised by the author. A third edition, enlarged, was published at Edinb. 1785; 317 pages, 12mo. This elementary work has been used as a text book in several foreign universities. Remarks on a pamphlet published by Dr Price, entitled *Observations on the Nature of Civil Liberty, &c.* Lond. 1776. *The History of the Progress and Termination of the Roman Republic.* Lond. 1783. 3 vols. 4to. A translation into German was printed at Leipsig in 1784. It has been translated into several other modern languages, and has passed through a number of English editions. *Principles of Moral and Political Science.* Lond. 1792, 2 vols. 4to. *Minutes of the Life and Character of Joseph Black, M.D.*, 1801. (Published in the *Transactions of the Royal Society of Edinburgh.*) *Biographical Sketch or Memoir of Lieutenant-Colonel Patrick Ferguson.* Edinb. 1817, printed, but not published for sale. He left behind him many papers; but a great mass of letters and other valuable documents had been indiscriminately destroyed by his direction some years before his death.

Ferguson, *James*, an eminent experimental philosopher, mechanist, and astronomer, was born at Keith, in Banffshire, in 1714, of parents in very humble circumstances. At an early age his extraordinary genius began to unfold itself. He first learned to read by overhearing his father teach his elder brother; and he had made this acquisition before any one suspected he had done so. He soon discovered a peculiar taste for mechanics, which first indicated itself on seeing his father use a lever; and having pursued this study a considerable time, even when very young, he at length made a watch in wood-work, from having once seen one. As he had no instructor, nor any help from books, everything he learned had all the merit of an original discovery; and such in fact he very naturally believed it to be. As soon as his age permitted he went out to service; but he met with hardships in this humble capacity which rendered his constitution feeble through life. Whilst he was servant to a farmer, whose goodness he acknowledges in the modest account of himself which he prefixed to his *Mechanical Exercises*, he frequently contemplated the stars; and he began the study of astronomy by constructing, from his own observations alone, a celestial globe. His kind master observing these marks of his ingenuity, procured him the countenance and assistance of some neighbouring gentlemen, by whose help and instructions he went on acquiring further knowledge, and was at length sent to Edinburgh. There, having obtained some notion of drawing, he began to take portraits in miniature, by which means he supported himself and family for several years, both in Scotland and England, whilst engaged in pursuing more serious studies. In London he first published some curious astronomical tables and calculations, and afterwards gave public lectures on experimental philosophy, which he repeated in most of the principal towns in England with general approbation. He was elected a fellow of the Royal Society without paying for admission; and he had a pension of L.50 per annum given him, unsolicited, by King George III. on his accession, who had heard his lectures, and who frequently sent for and conversed with him on curious topics. He also received several presents from his majesty, and from other patrons of merit. The degree of consideration which Mr Ferguson attained by the strength of his natural genius alone is in fact known to every one. In astronomy and mechanics he was pre-eminently distinguished, even in this nation of philosophers; and he might justly be styled self-taught, or rather heaven-taught; for in his whole life he had not received above half a year's instruction at school. He was a man of the clearest judgment and the most unwearied application to study; benevolent, gentle, and innocent in his manners as a child; humble, courteous, and communicative; and, instead of pedantry, philosophy seemed to have produced in him only diffidence and urbanity. Altogether his history is in its way one of the most interesting and instructive that has ever been recorded. He died in 1776, at the age of sixty-two.

The following is a list of Mr Ferguson's published works:—1. Astronomical Tables, and Precepts for calculating the true times of New and Full Moon, 1763. 2. Tables and Tracts relative to several Arts and Sciences. 3. An easy Introduction to Astronomy, 1769, 2d edition. 4. Astronomy explained upon Sir Isaac Newton's Principles, 1772, 5th edition. 5. Lectures on Select subjects in Mechanics, Hydrostatics, Pneumatics, and Optics, 1772, 4th edition. 6. Select Mechanical Exercises, with a short account of the Life of the Author by himself, 1773. 7. The Art of Drawing in Perspective made easy, 1775. 8. An Introduction to Electricity, 1775. 9. Two Letters to the Reverend Mr John Kennedy, 1775. 10. A third Letter to the Reverend Mr John Kennedy, 1775. Mr Ferguson also communicated several papers to the Royal Society, which were printed in their Transactions. In 1805, a valuable edition of his Lectures was published at Edinburgh by Dr, now Sir David, Brewster, in two volumes 8vo, with notes and an appendix, intended to adapt the whole to the actual state of science.

Ferguson, *Robert*, a Scottish poet who acquired a considerable share of celebrity at a very early period of life, was born at Edinburgh on the 5th of September 1750 or 1751. His father, whose name was William, paid court to the muses as well as the son; but he wisely relinquished the study of poetry for the more certain emoluments of trade and commerce, and was employed in different mercantile houses both in Edinburgh and in Aberdeen. He was an accountant in the Linen Hall when he died, but never acquired anything like an independent fortune.

The subject of this notice was of a weak and delicate constitution during infancy; so much so, indeed, that small hopes were entertained of his ever reaching the years of manhood. Yet such were the care and attention of his parents, that he was able to attend an English school by the time he was six years of age, when his progress was considered as very extraordinary; and it proved no less rapid at the High School of Edinburgh, which he attended for four years, acquiring a competent knowledge of the Latin tongue with very little labour or exertion. He then went to the grammar-school of Dundee, and in two years afterwards to the university of St Andrews, which his father preferred to Edinburgh, because a gentleman of the name of Ferguson had left two bursaries for the education of as many boys of the same name.

Ferguson's health was never at any time impaired by severe study; yet he kept alive at the university the opinion which had been entertained of him whilst at school, and he was decidedly the first mathematician of his own standing. He was patronized by Dr Wilkie, professor of natural philosophy, and also known as the author of the *Epigoniad*, who conceived an attachment for him, as much perhaps for

Feriæ.

his poetical as his mathematical talents. This kindness was repaid by Ferguson, on the death of Dr Wilkie, by a beautiful eclogue to his memory, written in the Scottish dialect.

He returned to Edinburgh when he had finished his studies, without having fixed on any particular employment; for although he was destined for the church by his father, on the death of the latter he paid but little attention to the expostulations of his mother. He was, however, induced to attempt the study of the law, in which, as might have been expected, he made no proficiency. He seems, however, to have turned a wishful eye to some sinecure place, in order to obtain which he paid a visit to a rich uncle who resided at Aberdeen, hoping that, through his influence, he might be settled in a manner suited to his merit. But in this expectation he was completely disappointed; for although his uncle at first showed him every mark of attachment, his fondness decreased by degrees; and in six months he desired his nephew in an abrupt manner to leave his house, without attempting to procure for him any kind of living.

His necessities at this period were so great that he copied papers in the commissary clerk's office for so much per sheet, an employment which he soon left in disgust. His exuberant wit, equalled only by his good nature, thoughtlessness, and social propensities, made all who knew him receive him with affection; but his powers of song and talents for mimicry often led him into the company of the dissipated, whose example could not fail to do him essential injury, and who had neither the power nor the inclination to provide for him through life. The irregularities in which he was thus led to indulge often awakened in him the reproaches of conscience; and the conversation of a minister, who understood his manner of life, appears to have made a deep impression on his mind. His remorse, indeed, soon afterwards assumed the appearance of absolute despair. His sprightliness entirely forsook him; but he gradually recovered from this despondency, and his health was at length fully restored. Soon afterwards his head was cut so severely by a fall, that he became delirious from the loss of blood; and in this condition he remained for some months, till the want of sleep and perpetual delirium put a period to his existence on the 16th of October 1774. He was buried in the Canongate churchyard. Over his grave a monument was erected by Robert Burns, who loved his genius, and naturally sympathized with failings akin to his own. Had Ferguson united prudence with his abilities, he would have no doubt risen to distinguished eminence in the literary world. His poems in the Scottish dialect have been very much admired by his countrymen; and when we reflect that they were composed in the intervals of dissipation, they must be considered as unequivocal evidences of his genius. (J. F. S.)

FERIÆ, in *Roman Antiquity*, holidays, or days upon which the people abstained from work. Proclamation was generally made by the herald, by command of the *Rex Sacrorum* or *Flamines*, that all should abstain from business; and whoever transgressed the order was severely fined.

The *feriæ* were of two kinds, public and private. The public *feriæ* were fourfold; first, *Stativæ*, which were kept as public feasts by the whole city upon certain immoveable days appointed by their calendar, as the *Compitalia*, *Carmentalia*, and *Lupercalia;* secondly, *Feriæ Conceptivæ*, which were moveable feasts, the days for the celebration of which were fixed by the magistrates or priests, as the *Feriæ Latinæ*, *Paganalia*, *Compitalia*, and others, which happened every year, though the days for observing them were left to the discretion of the magistrates or priests; thirdly, *Feriæ Imperativæ*, which were instituted by the mere command of consuls, prætors, or dictators, upon the gaining of some victory or other fortunate event; and, fourthly, *Nundinæ*. The *private* feriæ were holidays observed by particular persons or families, on several accounts, as birthdays, funerals, and the like. The *feriæ* belonged to the *dies festi*, and formed one division of them.

Feriæ Latinæ || Fermanagh.

FERIÆ *Latinæ*, a festival at which a white bull was usually sacrificed. On this occasion the Latin and Roman towns provided each a quantity of meat, wine, and fruits; and during its celebration the Romans and Latins swore eternal friendship to each other, taking home a piece of the victim to every town. The festival was instituted by Tarquinius Superbus, when, having overcome the Etruscans and made a league with the Latins, he proposed to build to Jupiter Latialis a common temple, at which both nations might meet and offer sacrifices for their common safety. At first the solemnity lasted but one day, but it was at different times extended to ten days. It was held on the Alban Mount, and celebrated with chariot races at the capitol, where the victor was treated with a large draught of infusion of wormwood.

FERISHTA, MOHAMMED CASIM, a celebrated Persian historian, was born in 1570, at Astrabad, on the shores of the Caspian Sea. While he was still a child his father was summoned away from his native country into Hindustan, where he held high office in the Deccan; and by his influence the young Ferishta received court promotion. In 1589 Ferishta removed to Bejapore, where he spent the remainder of his life under the immediate protection of the Shah Ibrahim Adil II. At the court of this monarch he died in 1611. Large portions of his History have been translated into English, particularly by Jonathan Scott. In the introduction a resumé is given of the history of Hindustan prior to the times of the Mohammedan conquest, and also of the victorious progress of the Arabs through the East. The body of the work contains much information on the geography and climate of Hindustan. Ferishta is reputed one of the most trustworthy of the oriental historians, and his work still maintains a high place as an authority.

FERMANAGH, an inland county in the south-western portion of the province of Ulster in Ireland, bounded on the north by Donegal and Tyrone, on the east by Tyrone and Monaghan, on the south by Cavan, and on the west by Cavan and Leitrim. According to the Ordnance Survey, it comprises an area of 714 square miles, or 457,195 acres, of which 289,228 are arable, 114,847 uncultivated, 6155 in plantations, 210 in towns, and 46,755 under water. In proportion to its area, therefore, Fermanagh has a greater quantity of land covered with water, and, in proportion to the arable land, a smaller extent of ground occupied by towns and villages, than any other county in Ireland.

Fermanagh was made shire ground in the eleventh year of the reign of Queen Elizabeth, and divided into the eight baronies of which it still consists, viz.

Baronies.	Contents in acres.			Annual valuation.		
Clanawley	75,286	3	35	£21,523	10	1
Clankelly	39,068	0	34	16,559	6	5
Coole	18,963	2	36	8,762	7	7
Knockninny	30,604	0	7	10,565	7	4
Lurg	83,109	2	33	27,217	17	6
Magherastephana	61,729	0	6	24,973	18	1
Magheraboy	94,171	1	13	31,905	3	1
Tirkennedy	54,353	3	3	£29,160	14	5
Total	457,286	3	7	£170,668	4	6

These baronies are subdivided into 23 parishes, all of which are in the diocese of Clogher excepting three, which are included in Kilmore diocese. The county is within the military district of Belfast, with barrack stations at Enniskillen and Belleek. The union workhouses are at Enniskillen, Lisnaskea, and Lowtherstown, and part of the county is comprised in the adjoining unions of Clones and Ballyshannon. The net annual value of property rated to the poor is L.195,864, and the amount of property valued under

the 6th and 7th Will. IV., cap. 84 (Griffith's valuation) is L.170,668.

The surface of the county of Fermanagh is uneven, exhibiting generally a succession of abrupt eminences of slight elevation. The borders towards Tyrone and Cavan, on the east, are mountainous. The north-western portion towards Leitrim presents one continuous mass of hills, many of them high, rough, and boggy. Of these Belmore Mountain, on the northern edge of Lower Lough Macnean, attains an altitude of 1312 feet. From the summit of the Toppid Mountain the greater part of Fermanagh, Tyrone, and Lough Erne may be seen. Quilca Mountain, partly in this county and partly in Cavan, rises to a height of 2188 feet. The south-eastern portion of the county is generally flat or but slightly elevated.

The great feature of the county is Lough Erne, which divides it nearly throughout its whole extent from north-west to south-east. This fine sheet of water forms two long lakes about five miles apart, connected by a fine river or strait, which, at about two-thirds of the distance from the Upper Lake, divides into two branches, leaving between them an island on which the principal part of the county town of Enniskillen stands. They are distinguished by the names of the Upper and Lower lakes. The former, or the more inland and southern lake, which lies between Belturbet and Enniskillen, is eleven miles in length, and from half a mile to six miles in width. The Lower and northern lake, which lies between Enniskillen and Belleek, is thirteen miles long, and from two to ten broad. The borders of both lakes are finely broken by numerous bays and inlets, formed by the projections of the surrounding hills, and both are studded with islands. Popular report makes the number of these equal to that of the days of the year; and, if all the detached points of rock or land visible above water were taken into the account, this number would not be much above the truth. There are not, however, more than 150 which deserve the name of islands. These are in general well formed for scenic effect, and some are planted, chiefly with ash and oak, to the water's edge. The largest of them, named Boa or Bow Island, containing about 1400 acres, is situated near the western extremity of the lake. But Devenish Island, near its eastern end, which comprises only about 80 Irish acres, of great fertility, is of much greater interest, from having on it one of the most perfect pillar towers in Ireland. Its height is 82 feet, and its circumference 49. It is built of cut stone, and finished at the top with a conical roof. Near the summit of the hill which forms the island is the abbey of St Mary's, of which the belfry staircase and some of the Gothic pillars still remain. At the foot of the hill is a church dedicated to St Molush; and in its vicinity are the remains of that saint's house, roofed and finished with cut stone. Within a few paces of the house is a stone trough, about six feet long, said to have been his bed, in which those affected with various complaints perform certain prescribed ceremonies, in the hope of obtaining relief. In the island of Ennism'saint are the ruins of an abbey founded by St Nevnid, whose festival is annually celebrated in it. The saint's bell, ornamented with gold and silver, is, says Archdall, still preserved in the island, and held in such veneration by the lower classes of people that it is often judicially tendered to swear on. "Next to the rock of Cashel," says Inglis, "I look upon Devenish Island to be the most interesting spot in Ireland, to those who are attracted by the union of the antique and picturesque." Belle-isle, containing about 112 acres, once the favourite residence of the Earl of Rosse, and celebrated as well for its natural beauties as for the taste displayed in its improvements, has been suffered to fall into such decay that scarcely a vestige remains of what it once was. Belle-isle is connected with the main land by a bridge. Lough Erne is navigable during the winter season through its whole extent to the fall of Belleek, within four miles of Ballyshannon. The navigation of the lake is chiefly carried on by small vessels called cotts, worked by oars; while a broad paddle at the stern serves instead of a rudder. A steamer of 20 horse power also plies between Enniskillen and the Ulster Canal at Wattle Bridge. Two other lines of inland navigation have been completed, one commencing at Lough Erne, and terminating at Lough Neagh; the other proceeding from the southern end of the Upper Lough Erne to the village of Leitrim, where it communicates with the Shannon. There are some smaller lakes in the county, the largest of which are Lough Melvin, on the borders of Leitrim, and Lough Macnean, on the confines of Cavan and Leitrim.

The only river of importance is the Erne, which rises in the county of Cavan, and after passing through Belturbet, falls into Lough Erne at its south-eastern extremity: thence, passing by Enniskillen, it enters the Lower Lake, at the north-western extremity of which it again narrows into a river, and, passing through Belleek, forms a fine water-fall, bursting out through a thick wood in a broad sheet: afterwards breaking over a ledge of shelving rocks, it foams through the arches of the bridge here thrown over it, after which it still maintains a rapid current, during a course of nine miles, in which it crosses many lesser ridges of rock, and at length precipitates its water down a noble cataract into the Atlantic at Ballyshannon. The other rivers are, the Arney, the Ballenclarogh, the Ballycassidy, the Clodagh, the Kish Water, the Moorlaugh, and the Sills; all of which, together with upwards of 50 smaller streams, contribute to feed the Loughs Erne.

The railway from Londonderry to Enniskillen is complete, and the lines from Dundalk and Newry are (1855) in progress. There is also a line of railway projected to Sligo from Enniskillen.

The geological structure of the county consists of yellow sandstone and carboniferous limestone, alternating with tolerable regularity. Red sandstone exists in Toppid Mountain. Yellow sandstone, well adapted for building, lies round the town of Enniskillen. Millstone grit occupies a district between the two sandstone formations. A beautiful species of brown marble is found near Florence-court, a limestone district; but it requires to be worked to a greater depth than at present in order to procure blocks and slabs free from flaws. Coal is said to have been found in Glengarron Hills; but there is no reason to suppose that it exists in such abundance as to become of importance in a commercial point of view.

Mineral springs are numerous. Rutty gives a list of 19, mostly sulphureous, but none are frequented by strangers.

The population of this county, according to the several authorities, the earlier of which cannot be relied on, has been stated as follows:—

1760, De Burgo	28,860
1792, Beaufort	71,800
1812, Parliamentary census	111,800
1821, Ditto	130,997
1831, Ditto	149,763

Baronies.	1841.			1851.		
	Males.	Females.	Total.	Males.	Females.	Total.
Clanawley	10,238	10,127	20,365	7,446	7,265	14,711
Clankelly	8.245	8,510	16,755	5,395	5,591	10,986
Coole	4,421	4,513	8,934	2,793	2,875	5,668
Knockninny	5,406	5,589	10,995	4,307	4,399	8,706
Lurg	13,536	14,052	27,588	9,990	10,397	20,387

Magherastephana	11,046	11,516	22,562	8,492	8,881	17,373
Tirkennedy	12,323	12,733	25,056	9,990	10,387	20,377
Total	76,982	79,499	156,481	56,807	59,200	116,007

Fermanagh.

The proportion of the number of males and females in this county is therefore about the average proportion for all Ireland, but above that of the inland counties, where, contrary to the general rule, the male population in several instances exceeds the female in number, which it never does in any of the maritime counties excepting Wicklow, in the neighbourhood of the metropolis. Between 1841 and 1851 the population of Fermanagh decreased 25 per cent., being 5 per cent. more than the average decrease for all Ireland in the same period, and nine per cent. more than the average for the province of Ulster.

The state of education, according to the returns made under the population act in 1821, and the Board of Education in 1824–26, was as follows:—

	Boys.	Girls.	Total.
1821	4032	2303	6335
1824–6	5845	3948	9793

Of the numbers in the latter return, 5283 were of the Established Church, 246 were Roman Catholics, 4204 Dissenters, whilst of the religious opinions of 60 there was no return. Eighteen schools, containing 1012 pupils, were supported by grants of public money; fifty-nine, containing 3433 pupils, by voluntary subscription; and the remaining 163 schools, containing 5348 pupils, were wholly maintained by the fees of the pupils. In 1854 there were 137 national schools in operation, attended by 8846 children—5275 boys and 3571 girls.

Near the town of Enniskillen is the well-endowed Royal School of Portora, founded in the reign of Charles II. According to the latest returns, there were 85 boys in the school; and in 1853 the rents received were L.1757, and the salaries paid to masters and assistants amounted to L.850.

Previously to the Union, the county was represented in the Irish parliament by four members, two of whom were returned for the county at large, and two for the borough of Enniskillen. At that period the number was reduced to three, one having been deducted from Enniskillen. No alteration in this arrangement was made by the Reform act. Since the Union, both town and county have been represented exclusively by members of the Tory party.

The state of the constituency at the four periods following, viz.—the first, before the disfranchisement of the forty-shilling freeholders, which took place on the passing of the Catholic Relief bill; the second, subsequent to that event, but previously to the passing of the Reform bill; the third, subsequent to the Reform act; the fourth, under the 13th and 14th Vict., cap. 69, was as under:—

	L.50.	L.20.	L.10.	40s.	Total.
1st Jan. 1829	252	183	—	6443	6878
1830	254	256	522	—	1032
1832	178	250	1001	—	1429
1853	—	—	—	—	4365

This county is almost exclusively agricultural. Farms vary from nine acres, chiefly under tillage, to large tracts for grazing.

The number of holdings of every class in 1852 and 1853 was as follows:—

	Not exceeding 1 acre.	From 1 to 5 acres.	From 5 to 15 acres.	From 15 to 30 acres.	From 30 to 50 acres.	From 50 to 100 acres.	From 100 to 200 acres.	From 200 to 500 acres.	Exceeding 500 acres.
1852	470	1,229	4,777	4,691	2,111	1,046	270	85	17
1853	466	1,167	4,845	4,654	2,088	998	276	83	17
Difference for 1853,	– 4	– 62	+ 68	– 37	– 23	– 48	+ 6	– 2	Nil.

The number of holdings exceeding one acre in extent amounted in 1852 to 14,226, and in 1853 to 14,128, being a decrease of 98, showing that this county is not one of the exceptions to the general practice latterly prevailing in Ireland of consolidating farms.

Much land has heretofore been let in the gross to middlemen, who sublet it to smaller tenants. Landowners of this description were distinguished by the name of ternybegs, or little landlords—from the Irish *tiernagh*, a prince, and *beg*, little. There is much land belonging to the see of Clogher in the county. Rents are sometimes paid in the mountainous districts in young cattle, butter, and yarn. Oats and barley are the kinds of grain chiefly raised; wheat is little grown. The manures are marl, limestone, limestone gravel, bog-mould, and bog-ashes. The marl is white and light, found under bogs and in banks. That about Florence-court is upon clay and gravel, with springs under it, which cause the marl to assume sometimes a tuberous form, coloured by oxide of iron.

The extent of land under crops of various descriptions from 1846 till the present year (1855) has been ascertained to be as follows:—

Years.	Corn, Beans, and Peas.	Potatoes.	Turnips.	Mangel Wurzel and other Green Crops.	Flax.	Meadow and Clover.	Total.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
1847	55,233	3,681	3,575	961	1,221	28,712	93,383
1848	55,852	9,185	4,606	1,481	1,131	30,170	102,425
1849	55,097	11,093	5,980	2,769	1,015	29,919	105,873
1850	52,698	13,736	5,280	1,982	1,283	28,685	103,664
1851	53,082	13,059	5,724	2,602	2,800	30,468	107,735
1852	48,709	13,594	5,407	2,534	2,537	32,784	105,565
1853	45,387	16,924	5,509	2,232	3,988	34,128	108,168
Average	52,294	10,181	5,154	2,080	1,996	30,709	103,830

The total produce of corn, beans, and peas in 1853 was 31,675 tons, or an average of 612 lbs. per head on the population, being 88 lbs. less than the average for all Ireland; the produce of the potato crop in the same year was 979,620 barrels; average per head 169 stones, the average production for the whole country being 140 stones. In the returns to an inquiry instituted into the comparative care or negligence prevailing in the cultivation of

Fermanagh.

farms and the condition of road-sides as to weeds in the 32 counties of Ireland, Fermanagh is numbered 14 in the list of comparative freedom of farms from weeds, and 4 in that representing the comparative condition of the road-sides.

Timber is more general in Fermanagh than in some of the neighbouring counties. Beech grows to a large size. Ash is peculiarly abundant in Fermanagh as well as the adjoining counties of Cavan and Tyrone. About sixty years ago, in a mountain glen connected with the demesne of Florence-court, the upright variety of yew tree, known as the Irish yew, and a valuable object in pleasure-grounds from its elegant and compact growth, was first observed.

Concurrently with the decrease in the number of hold ings in Ireland, the quantity of stock has largely increased. The following table exhibits the quantity of live stock in this county from 1846, and its estimated value since 1849.

Years.	Horses.	Mules and Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.	Estimated Value.
	No.	No.	No.	No.	No.	No.	No.	£
1847	6,081	3,965	75,689	8,364	6,248	2,138	110,297	...
1848	6,510	4,338	81,710	8,871	8,089	2,229	151,622	...
1849	6,773	4,662	87,657	10,279	13,000	2,572	167,179	662,367
1850	6,446	4,527	88,040	10,260	14,745	2,722	180,594	664,665
1851	6,518	4,749	88,651	11,371	17,843	3,055	195,674	675,185
1852	6,416	4,521	85,102	12,555	16,853	3,461	191,728	650,981
1853	6,814	4,750	94,735	14,791	19,113	3,787	209,561	723,022
Average.	6,508	4,501	85,940	10,927	13,698	2,852	172,522	675,224

The trade of the county in butter is considerable, and the linen manufacture, of a coarse description of goods, chiefly for domestic use, is carried on to a small extent. The number of scutching mills in the county is 10, all of which are moved by water-power.

Fermanagh has few resident proprietors of high rank or large income, all members of the Established Church deriving their titles to their estates from Elizabeth, James I., or Cromwell. The English family of the Coles received large grants of land, and in 1760 John Cole was created Baron Mount Florence, and his successor Viscount and Earl of Enniskillen. The family mansion and demesne of Florence-court is among the most beautiful in the country. The mansion of Castle Coole, the seat of the Earl of Belmore, is built of Portland stone, in the Grecian style of architecture after a design by Wyatt, and at a cost of upwards of L.200,000. Among the many other fine residences in this county are Ely Lodge, the seat of the Marquis of Ely; Castle Caldwell; Riversdale; the modern Castle of Crum, the seat of the Earl of Erne; Castle Saunderson, &c.

A class of yeomanry is to be met with in this county who distinguish themselves by the character of being "as good Protestants as any in Ireland." These are farmers, who hold tracts of land of considerable extent, and were settled in the county when the right to the elective franchise was exclusively in the hands of Protestants. At that period Catholic tenants were often turned out of their farms, and sent farther up the mountains, to make room for the privileged class. The population of Fermanagh are in general a fine race, and Mr Foster remarks, that "the difference in the appearance of the people themselves in Leitrim and Fermanagh is as remarkable as the difference in dress and houses, and in the appearance of the country. At Ballinamore, in Leitrim, at a fair—with at least 10,000 men present, amongst whom I walked, and to whom I spoke, I scarcely saw a man above 5 feet 4 inches in stature, and I do not think I saw a dozen men in the whole fair so tall as myself. In the streets of Enniskillen every third man I met was a bigger man than myself."—*Letters on the Condition of the People of Ireland.*

Enniskillen is celebrated as a depot for obtaining recruits for the army. A regiment of horse was raised here in the time of King William, which is still distinguished by the name of the Enniskillen dragoons. This circumstance, together with the general habits and character of the peasantry, has tended to keep up a military spirit throughout the county.

The only large town in Fermanagh is the neat respectable-looking county town of Enniskillen, situate on an island having an area of sixty-two acres, formed by the river connecting the upper and lower Loughs Erne, and partly on the adjoining mainland on both sides, which communicate with each other by two bridges. It was founded in 1612 by William Cole, ancestor of the Earl of Enniskillen, to whom the chief portion of the town still belongs. It contains a parish church, a Roman Catholic chapel, Presbyterian and Methodist meeting-houses, and the usual buildings common to county and assize towns, but none of any great architectural pretensions. The corporation styled the "Portreve Free Burgesses and Commonalty of the Borough of Enniskillen," is now extinct, and its property vested in town commissioners. The population of Enniskillen in 1851 was 6000, and it was the only place in the county containing more than 2000 inhabitants.—(*Thom's Almanac*, &c.) (H. S—R.)

Fermat.

FERMAT, Pierre de, equally celebrated as a restorer of ancient mathematics, and an original author of modern improvements, was born at Toulouse about 1595. His public life was occupied by the active duties attached to the situation of a counsellor for the parliament of Toulouse, in which he was distinguished both for legal knowledge and for strict integrity of conduct. Though the sciences were the principal objects of his private studies, he was also an accomplished scholar, an excellent linguist, and even a respectable poet.

His *Opera Mathematica* were published at Toulouse, in two volumes folio, 1670 and 1679: they are now become very scarce. The first contains the *Arithmetic of Diophantus*, illustrated by a commentary, and enlarged by a multitude of additional propositions. In the second we find a *Method for the Quadrature of Parabolas* of all kinds, and a *Treatise on Maxima and Minima, on Tangents and on Centres of Gravity;* containing the same solutions of a variety of problems as were afterwards incorporated into the more extensive method of fluxions by Newton and Leibnitz; and securing to their author, in common with Cavalleri, Roberval, Descartes, Wallis, Barrow, and Sluse, an ample share of the glory of having immediately prepared the way for the gigantic steps of those illustrious philosophers. The same volume contains also several other treatises on *Geometric Loci*, or *Spherical Tangencies*, and on the *Rectification of Curves*, besides a restoration of *Apollonius's Plane Loci;* together with the author's correspondence, addressed to Descartes, Pascal, Roberval, Huygens, and others.

It was too much Fermat's custom to leave his most important propositions wholly undemonstrated; sometimes,

perhaps, because he may have obtained them rather by induction than by a connected train of reasoning; and in other cases, for the purpose of proposing them as a trial of strength to his contemporaries. The deficiency, however, has in many instances been supplied by the elaborate investigations of Euler and Lagrange, who have thought it no degradation to their refined talents to go back a century in search of these elegant intricacies, which appeared to require further illustration. It happened not uncommonly that the want of a more explicit statement of the grounds of his discoveries deprived Fermat, in the opinion of his rivals, of the credit justly due to him for accuracy and originality. It was thus that Descartes attempted to correct his method of *maxima* and *minima*, and could never be persuaded that Fermat's first propositions on the subject were unexceptionable. Fermat was however enabled to pursue his favourite studies with less interruption than Descartes; and the products of his labour were proportionate, as Lacroix remarks, to the opportunities he enjoyed, as well as to the talents he possessed.

There is a very ingenious proposition of Fermat which deserves to be particularly noticed, on account of the discussion that it not long ago excited among mathematical philosophers. He has demonstrated that the true law of the refraction of light may be deduced from the principle, that it describes the path by which it can arrive in the shortest possible time from any one point of its tract or course to another; on the supposition, however, that the velocity of light is inversely proportional to the refractive density of the medium: and the same phenomena of refraction have been shown by Maupertuis to be deducible, upon the opposite supposition with respect to the velocities, from the law of the minimum of action, considering the action as the product of the space described into the velocity. But the law of Fermat is actually a step in the process of nature, according to the conditions of the system to which it belongs in its original form; whilst that of Maupertuis is at most only an interesting commentary on the operation of an accelerating force. It was Newton who showed the necessary connection between the action of such a force and the actual law of refraction; demonstrating that all the phenomena might be derived from the effect of a constant attraction, perpendicular to the surface of the medium: and, except in conjunction with such a force, the law of Maupertuis would even lead to a false result. For if we supposed a medium acting on a ray of light with two variable forces, one perpendicular to the surface, and the other parallel to it, we might easily combine them in such a manner as to obtain a constant velocity within the medium, but the refraction would be very different from that which is observed, though the law of Maupertuis would indicate no difference; so that the law must be here applied with the tacit condition that the refractive force is perpendicular to the surface. In Laplace's theory of extraordinary refraction, on the contrary, the tacit condition is, that the force must *not* be perpendicular to the surface; so that this theory not only requires the gratuitous assumption of a different velocity for every different obliquity, which is made an express postulate, but also the implicit admission of the existence of a force, determinate in direction and in magnitude, by which that velocity is modified, and without which the law of Maupertuis would cease to be applicable. It may indeed be said, that the supposition of a medium exhibiting unequal velocities, and attracting the light perpendicularly, is unnatural, and that the law is the more valuable for not being applicable to it; but a mathematical equation is true even with respect to impossible quantities, and a physical law, however useful it may be, requires physical proof; and it will not be asserted that the law of Maupertuis has been or can be established by physical evidence sufficiently extensive to render it universal.

Fermat died at Toulouse in the end of 1664, or beginning of 1665, at the age of seventy. He left a son, Samuel de Fermat, who was a man of some learning, and published translations of several Greek authors. (T. Y.)

FERMENTATION. See Brewing, Chemistry, Wine-Making.

FERMO, the ancient *Firmum*, an archiepiscopal city of central Italy, capital of a cognominal delegation in the Papal States, 34 miles S. by E. of Ancona. The city is surrounded by old walls, and has besides the cathedral numerous churches and convents, a university, and two fine collections of statuary and paintings. Lactantius and Galeazzo Sforza were born here. The port, Porto di Fermo, is situated on the Adriatic, about four miles from the town. The harbour is small, but has some trade in corn, silk, and woollens. Pop. 7000.

FERMOY, a market-town of Ireland, county of Cork, situated on the Blackwater river, 20 miles N.E. of Cork, and 137 miles from Dublin. Previous to 1791, Fermoy was a mere hamlet, but about that time the proprietor, Mr Anderson, commenced a series of improvements; and shortly afterwards infantry and cavalry barracks were erected, commanding an important pass of the Blackwater, which is one of the principal northern approaches to Cork. The river is here crossed by a stone bridge of 13 arches, erected in 1689. Besides the parish church and Roman Catholic chapel—both elegant edifices—Fermoy has also a Roman Catholic college, a nunnery, court-house, theatre, bridewell, and workhouse. It has likewise several extensive flour mills, two paper mills, and a considerable trade in flour and agricultural produce. Market-day, Saturday. Pop. (1851) 5844, besides 2682 in workhouse.

FERN or Farn Islands, a group of small islets and rocks, 17 in number, lying off the coast of Northumberland, but included in the county of Durham. There are two lighthouses on these islands. It was here in 1838 that Grace Darling and her father in stormy weather rescued the passengers of the "Forfarshire" steamer. The Fern Islands are frequented by immense numbers of sea-birds.

FERNANDO DE NORONHA, an island in the South Atlantic, lying about 70 leagues from the coast of Brazil. It is about 20 miles in circumference, and the surface is rugged and is mountainous. It has several harbours defended by forts, and serves as a place of banishment for criminals from Brazil. N. Lat. 3 56., W. Long. 32. 28.

FERNANDO PO, or Fernão do Pão, an island on the W. coast of Africa, lying in the Bight of Benin, about 20 miles from the mainland, in N. Lat. 3. 25., E. Long. 8. 50. It is about 44 miles in length from N.N.E. to S.S.W., and about 20 in breadth. The coasts are steep and rocky, and the interior is mountainous. A ridge of mountains towards the centre of the island rises to the height of 8000 feet, and is terminated at each extremity by a peaked mountain,—the one at the N. extremity attaining a height of 10,700 feet. The southern extremity of the island is also intersected by several steep mountains, varying from 1000 to 3000 feet. These mountains are covered, most of them to their summits, together with the intervening valleys, with dense forests of shrubs and lofty trees of luxuriant growth. The rocks are of volcanic origin; and the soil is rich and fertile, producing rice, sugar-cane, cotton, tobacco, yams, palms, &c. Sheep, goats, fowls, turtle, and fish, are abundant. The climate is salubrious, though the rainy season lasts from May to December, and is succeeded by a season of dense fogs. The harbours are small, the largest being Port Clarence on the northern shore. This island was discovered in 1471 by a Portuguese navigator, whose name it bears. It was taken possession of by Spain in 1778, but abandoned in 1782. The English in 1827 formed a settlement here, but relinquished it in 1834; the Spaniards resumed possession of it in 1844, and have given it the name of

Puerto de Isabel. The native population is estimated at about 15,000.

FERNEL, Jean François, a distinguished French physician, was born at Clermont in 1497. His immense general erudition, and the skill and success with which he sought to revive the study of the old Greek physicians, gained for him a great reputation, and ultimately the office of physician to the court. He practised with very great success, and at his death in 1558 left behind him an immense fortune. His principal works are, *Monalosphærium, sive Astrolabii genus, generalis Horarii Structura et Usus*, Paris, 1526; *De Abditis rerum Causis*, a work which went through thirty editions in a short time; *Medicina, ad Henricum II.*, &c., which was also very frequently reprinted; and *Consiliorum Medicinalium Liber*, Paris, 1582, a work which enjoyed a similar distinction.

FERNEY, a village in the arrondissement of Gex, department of Ain, France, 5 miles N.W. of Geneva. It is celebrated as having been for nearly 20 years the residence of Voltaire, and hither the greatest personages of the time eagerly resorted to pay their respects to that great genius. Previous to his purchase of the estate in 1758, Ferney was a wretched hamlet, consisting of a few hovels. He formed it into a neat little town, colonized it with industrious artizans, chiefly watchmakers from Geneva, and drained and planted the adjacent grounds. The château in which he resided has been so much altered by the present proprietor, that scarcely a relic of Voltaire now remains.

FERNS, *Filices*. See Botany.

FEROE ISLES. See Faroe.

FERONIA, an ancient Italian divinity (related to Tellus), the patroness of woods and orchards, and the guardian deity of freedmen. Several groves were consecrated to Feronia; and in these, on the festivals of the goddess, great markets were held. Her chief sanctuary was at Terracina, near Mount Soracte. Strabo relates, that those who sacrificed to Feronia walked barefoot on burning coals without being hurt. She is variously represented;—viz. as the goddess of liberty; of commerce and traffic; or as a goddess of the earth.

FEROZEPOOR, a town of Hindustan, and the chief place of a British district of the same name, which, upon the demise of its native ruler in 1835, lapsed to the British government as the paramount power. Since its occupation by its new masters great improvements have been effected. Both town and fort were, in the first instance, new-modelled and rebuilt of burnt brick; the streets have now greater width, and the colonnaded rows of shops exhibit the aspect of an extensive mercantile city. From its position Ferozepoor is well adapted for a commercial entrepôt, being situate near one of the great ferries over the Gharrah, and possessing the means of easy communication with the lower part of the Punjaub and Sinde, afforded by that river and its recipient the Indus. It was here that in November 1838 the interview took place between Runjeet Singh, then ruler of the Punjaub, and Lord Auckland the governor-general, on which occasion 10,000 men rendezvoused at the town previously to their advance to the invasion of Afghanistan. Ferozepoor is distant N.W. of Calcutta 1181 miles. Lat. 30. 55., Long. 75. 35.

FEROZESHAH, in Hindustan, a village situated a few miles from the left bank of the river Sutlej. Here, on the 21st December 1845, the camp of the Sikhs was attacked by the British army under Sir Hugh Gough (afterwards Lord Gough), and Sir Henry Hardinge (afterwards Lord Hardinge). The camp was formidably intrenched, and the contest was most severe. The fall of night did not altogether put an end to it, the guns of the assailants continuing to play on part of the enemy's intrenchments. On the 22d fighting was resumed, and the final result was a complete triumph to the British arms; but it was dearly purchased. The loss of the victors was immense; and among the killed were included some of the best and most distinguished officers of the British army. Through a mistake, the force employed in the attack was lamentably deficient in the two important arms of war, cavalry and artillery; which led to a prolongation of the conflict, and might have affected its termination. Lat. 30. 52., Long. 74. 50.

FEROZPOOR, a town of Hindustan, and the principal place of the district of the same name, in the British province of Goorgaon. The jaghire or feudal possession of Ferozpoor, containing an area of about 140 square miles, was bestowed in the beginning of the present century by Lord Lake upon the Nawaub Ahmed Buksh Khan, in consideration of certain diplomatic services rendered by him at the court of the ruler of Alwur. The Nawaub, dying in 1827, was succeeded by his son Shumsooddeen Khan. The two younger brothers of Shumsooddeen having well-founded claims upon a portion of the inheritance, Mr William Fraser, the British political agent at Delhi, exerted himself to induce the British government to make a partition in their favour. The result was the murder of Mr Fraser at Delhi, by the hand of an assassin in the employ of Shumsooddeen. This took place in October 1835. Shumsooddeen was brought to trial for the murder, and being duly convicted, was hanged; and his possessions being declared forfeited, Ferozpoor was incorporated with the British province of Goorgaon. The town is distant N.W. from Calcutta 895 miles. Lat. 27. 47., Long. 77. 1.

FERRARA, a celebrated city of the Papal States, capital of a cognominal legation, and the seat of an archbishopric, is situated in a low marshy plain on the left bank of the Volano, an arm of the Po, about five miles S. of the main channel. Ferrara is said to have had its origin about the middle of the fifth century, and was walled by the exarch of Ravenna in 585. In 657 it was made the seat of a bishopric, and of an archbishopric in 1735. In 1240 the family of Este became hereditary princes of Ferrara, and continued to hold it sometimes under the pope and sometimes as independent princes, till the reigning branch became extinct in 1597, when it was finally attached to the papal dominions. During the latter part of this period Ferrara was the seat of one of the most polished and refined of the Italian courts, and is said to have contained more than 80,000 inhabitants. Ferrara receives an additional lustre from its connection, about this time, with the names of Ariosto, Tasso, and Guarini. In the fifteenth century it was famous for its school of painting, which ranked as one of the first in Italy. Calvin and other French reformers found an asylum here when driven from France in the early part of the sixteenth century. In 1796 Ferrara was taken by the French, and became the capital of the department of Bas-Pô, but was restored to the pope in 1814. The city has long been in a state of decay, and is only interesting to the traveller from its associations with the past: grass now grows on its once well-trodden streets, and many of its splendid palaces are uninhabited, and rapidly going to decay.

> "Ferrara! in thy wide and grass-grown streets,
> Whose symmetry was not for solitude,
> There seems, as 't were, a curse upon the seats
> Of former sovereigns, and the antique brood
> Of Este, which for many an age made good
> Its strength within thy walls, and was of yore
> Patron or tyrant, as the changing mood
> Of petty power impelled, of those who wore
> The wreath which Dante's brow alone had worn before."
>
> *Childe Harold*, iv. 35.

Being the most northern city in the Papal States, Ferrara is strongly fortified, and is defended on the western side by a pentagonal citadel, which, in accordance with the treaty of Vienna, is garrisoned by Austrian troops. The old ducal palace, now the residence of the legate, stands in the middle

of the town, and is surrounded by wet ditches, and flanked with towers. The cathedral, a vast untasteful edifice, consecrated in 1135, is adorned with sculptures, bronze statues, frescoes, and paintings. Many of the other churches contain many finely sculptured monuments and paintings by the great masters of the schools of Bologna and Ferrara. The theatre is one of the largest and finest in Italy. The university, founded in 1390, and revived by Leo XII., is noted for its faculties of law and medicine. The public library, founded in 1740, contains about 80,000 printed volumes and 900 manuscripts, among which are the manuscripts of the works of Ariosto and Tasso. The house in which Ariosto lived is still in existence. The bust on his tomb in the church of the Benedictines was, towards the middle of the last century, struck by lightning, and the iron laurels that wreathed its brow were melted; a circumstance alluded to by Lord Byron in *Childe Harold* (iv. 41). In 1801 the remains and tomb of Ariosto were removed with great pomp to the public library, and here are also his arm-chair and ink-stand. In the lunatic hospital of Santa-Anna a small room on the ground-floor is still shown as that in which Tasso was confined. In the principal square are bronze statues of two of the dukes of Ferrara. The manufactures and trade of the town are inconsiderable. Pop. about 25,000, of whom about 2000 are Jews, who reside together in the *ghetto* or Jews' quarter.

The Legation of Ferrara is the most northern in the papal dominions; and is bounded on the N. by the main branch of the Po, which separates it from Austrian Lombardy, W. by the duchy of Modena, S. by the legations of Ravenna and Bologna, and E. by the Adriatic. The surface is generally flat, and being in many parts below the level of the Po it is protected from inundations by strong embankments along the river. (See Po.) A considerable portion of the eastern part of the legation is constantly under water. Area 1042 square miles. Pop. (1850) 229,862.

FERRIER, Barbara, a distinguished Scottish novelist, was born at Edinburgh in 1782. Her father was associated with Sir Walter Scott as one of the clerks of the Court of Session, and this connection opened up to Miss Ferrier the best literary society of her birth-place. She made her *début* in literature in the novel of *Marriage* published anonymously in 1818. Though the success of this tale was very flattering, she never dropped the mask, and her subsequent novels, *The Inheritance*, and *Destiny or The Chieftain's Daughter*, given to the world respectively in 1824 and 1831, also appeared without the author's name. This circumstance led Sir Walter, when alluding to her in his *Tales of My Landlord* as a skilful delineator of Scottish life and character, to describe her as his "sister shadow, the author of the very lively work entitled *Marriage*." At a later period, talking from a more intimate knowledge, he praised her as "a gifted personage, having, besides her great talents, conversation the least *exigeante* of any author, female at least, whom he had ever seen among the long list he had encountered with; simple, full of humour, and exceedingly ready at repartee, and all this without the least affectation of 'the blue-stocking.'" A perusal of Miss Ferrier's works would lead the reader to expect in her the very character limned by her great friend in this brief sketch. All her works show a keen insight into human nature, especially in its foibles and oddities, great breadth of comic humour, and an exhaustless fund of racy and caustic wit. Character-drawing, however, is her forte. All her *dramatis personæ* are vigorously, sometimes even deeply, drawn. Far more truly than it was said of Miss Burney by Dr Johnson, may it be said of Miss Ferrier, that she is a complete character-monger. Even her earliest tale, confessedly weak in the matter of plan, is a perfect gallery of portraits. The plots of her later novels are much more carefully wrought out, and, with equal merits of detail, far more artistic in their general effect. The dialogue is well maintained, spirited, and natural throughout. Scotch is freely used, and besides being peculiarly pithy and terse, is so idiomatic, that on any but a native ear much of its charm must be thrown away. As Miss Ferrier wrote neither for fame nor money, she was saved from all the annoyances that beset the literary career. Her circumstances placed her above the small jealousies of literary rivalry, and enabled her to hold back her works until they had received the highest polish she could give them. The pains and toil of this process were cheerfully undergone by the novelist. Long before her death she had the satisfaction of seeing that she had not toiled in vain. Her works have taken their place in the permanent literature of the country, and vindicated their author's title to rank with the Edgeworths and Austens of the first half of the nineteenth century.

Miss Ferrier spent the greater part of her long life in Edinburgh, in the enjoyment of peace and quiet, and in the performance of every good and virtuous deed. She died in November 1854, in the seventy-third year of her age.

FERROL, a sea-port town of Spain, province of Coruña, and one of the first naval arsenals in the kingdom, is situated on the N. arm of the Bay of Betanzos, 12 miles N.W. of the town of Coruña. The harbour, which is one of the best in Europe, is deep, capacious, and secure; but the entrance, which is a strait about two miles in length at the narrowest part, only admits one ship at a time, and is commanded on either side by strong forts. The town is protected on the land-side by a wall, on which 200 cannon might be mounted. The dockyard is divided into two parts, the outer being the smaller, and the whole occupying a space of more than 115,000 square yards. Behind the inner dock are the dwellings of the operatives, and in the N. angle are the foundries, rope-walks, and magazines. They are all, however, as well as the arsenal, in a neglected and ruinous condition. The old town is very irregular, but the new town is a parallelogram of seven streets in width by nine in length, intersecting each other at right angles, and has two squares, in one of which is a fountain, erected in 1812 in honour of Cosme Churruca, a naval officer, killed at Trafalgar. The Alameda, or public walk, is between the new town and the Astillero or dockyard. Ferrol contains two hospitals, three large churches, a monastery, consistory, prison, naval barracks, academies of navigation and mathematics, and has 16,641 inhabitants.

FESTUS, Sextus Pompeius, a celebrated Latin grammarian of uncertain date, but who probably flourished in the third century of the Christian era. His celebrated work *De Verborum Significatione*, a valuable treatise on many obscure points of grammar, mythology, and antiquities, was an epitome of the voluminous work of M. Verrius Flaccus, a grammarian who flourished in the reign of Augustus. In compiling this abridgment Festus had made a few alterations, and inserted some critical remarks of his own, besides omitting altogether such ancient Latin words as had long been obsolete. These he discussed in a separate work now lost, entitled *Priscorum Verborum Libri cum Exemplis*. Of Flaccus' work only a few fragments have come down to us. Of Festus' epitome only one original copy is known to be in existence, and that in a very imperfect form. After passing through very many vicissitudes, it found a temporary shelter in the Farnese Library at Parma, whence in 1736 it was taken to Naples, where it now lies. At the close of the eighth century Paulus Diaconus, who happened to possess a copy of Festus' work, epitomized it; but as he was himself a poor scholar, he allowed countless errors to creep into his abridgment. From this work of his, and the solitary mutilated copy of the original which still survives, some of the most distinguished scholars of modern Europe have attempted to reconstruct the important treatise of Festus. Of the early editions the best are

those of Scaliger, published in 1565, and of Fulvius in 1581, by both of which editors many of the blanks are filled up by conjecture. But by far the best of existing editions is that of K. O. Müller, Leipzig, 1839. Festus' work is in many respects extremely valuable. He gives not only the meaning of every word, but also its etymology; and this work, fragmentary as it is, has thrown much light on the language, mythology, and antiquities of ancient Rome.

FETIALES, or FECIALES, in *Roman Antiquity*, a college of priests, whose duty it was, when any dispute sprang up between their countrymen and a foreign state, to demand satisfaction, decide if war were necessary or advantageous, and perform the solemn rites consequent on the declaration of hostilities or the ratification of peace. The institution of this college is attributed by common consent to Numa. They are believed to have been twenty in number, and to have been originally chosen from the noblest families. Their office lasted for life, and their persons were deemed peculiarly sacred. The etymology of the word is very uncertain. By some it is derived from the same root with *fidus* and *fœdus;* by others from *ferio* or *facio;* while some modern scholars trace it to the Greek φημί. A detailed account of their principal duties will be found under CLARIGATIO.

FETICHE, the symbolic representation of the tutelary deity worshipped by the negroes of Africa. Anything appears to serve for a fetiche; as a tree, a stone, the beak of a bird, the fin of a fish, &c. See CONGO, vol. vii., p. 246.

FEU, in *Scots Law*, is used in contradistinction to ward-holding or military tenure, to signify that holding where the vassal makes a return in grain or money in lieu of military service. The person so holding is termed a *feuar;* and the rent paid *feu-duty*.

FEUD, or DEADLY FEUD, among our Saxon ancestors, was used to signify an irreconcilable enmity, to be satisfied only with blood. Such enmity and revenge were sanctioned by law. Thus when a man was killed, if no pecuniary satisfaction were made to his kindred, it became lawful for them to avenge themselves by slaying his murderer.

FEUDAL LAW is that system of Gothic jurisprudence which reached its full maturity during the middle ages, and which long continued to regulate the tenure of real property in the principal countries of Europe. The relations of lord and vassal have undergone very essential changes, the knight no longer holds his estate on the condition of military service, and most of the feudal incidents have been gradually superseded as unsuitable to the spirit of modern times; but this law has left many deep traces behind it, and is so closely interwoven with our national institutions, that it could not without great difficulty be entirely disentangled. Where the substance has almost totally vanished, the form is in some instances not very advantageously retained.

Of the word feudal many different etymologies have been proposed. According to Somner, who treads in the steps of Selden and Spelman, feud is a German compound, which consists of *feh, feo,* or *feoh,* signifying a salary, stipend, or wages, and of *hade, head,* or *hode,* signifying quality, kind, or nature; so that, in its primary acceptation, feudum, or land held in fee, was such as was held in *fee-hode,* by contraction *feud* or *feod;* that is, in a stipendary way, with the acknowledgment of a superior, and a condition of returning some service for it, on the withdrawing of which, the land was revertible to the superior.[1] Sir Martin Wright has remarked that "this etymon not only suggests the most probable account of the word, but gives us the clearest description of the thing itself."[2]

The origin of the feudal system is a question which has been long and much agitated, and different authors have arrived at very different conclusions. "It has puzzled the learned," says Dr Stuart, "to discover the nation of the barbarians which first gave a beginning to fiefs. No inquiry could be more frivolous. In all of them they must have appeared about the same period; and they prevailed in all of them in consequence of the similarity of their situation on their conquests, and in consequence of their being governed by the same customs. It is not therefore to the principle of imitation that their universality is to be ascribed."[3] But the most comprehensive and the most decided opinion is that of Mr Pinkerton, who avers that "the feudal system, about which so much noise is made, is the natural fruit of conquest, and is as old in the world as conquest. A territory is acquired, and the state, or the general, bestows it on the leaders and soldiers, on condition of military service, and of tokens acknowledging gratitude to the donors. It was known in the Greek heroic ages. It was known to Lycurgus, for all the lands of Sparta were held on military tenure. It was known to Romulus, when he regulated Rome. It was known to Augustus, when he gave lands to his veterans, on condition that their sons should, at fifteen years of age, do military service. The reason it did not preponderate and corrupt in Greece and Rome was, that it was stifled by the necessary effects of cities, as above mentioned. In Persia, where there were no cities of any power or privilege, it preponderated and corrupted at an early period. The feudal system, whether in its original democracy, or corrupted into aristocracy, must limit the power of kings; for men who hold their possessions on military service, must of course have arms in their hands: and even in absolute governments the soldiers are free, witness the prætorian bands and armies of imperial Rome, and the Turkish janisaries. By the feudal system every man held arms and freedom in his hands. Montesquieu has begun his account of the feudal system with that of the ancient Germans, given by Tacitus,[4] and prides himself in leaving off where others began. A writer more profound would leave off where Montesquieu begins."[5] This last sentence may be considered as a modest attempt at impressing the reader with an opinion that Pinkerton is a writer more profound than Montesquieu; but, without acquiescing in all his notions, we may at least admit that of the feudal system many authors have taken a view much too narrow and limited. The peculiar relation of lord and vassal, of territorial grants and the tenure of military service, is doubtless to be traced in very remote ages and countries. All the feudal incidents it may often be difficult to detect; but wherever we find portions of land granted to military vassals under the condition, express or implied, of following the standard of their lord, we there find the most essential characters of the feudal system. The order of chivalry may not be found completely engrafted: there may be no denomination equivalent to that of knight, and such incidents as those of relief, aids, and wardships, may be wanting; but instead of a faint analogy, there may still be a very close resemblance between one system and another.

Feudal Law.

"It has been very common," says Mr Hallam, "to seek for the origin of feuds, or at least for analogies to them, in the history of various countries. But, though it is of great importance to trace the similarity of customs in different parts of the world, because it guides us to the discovery of general theorems as to human society, yet we should be on our guard against seeming analogies, which vanish away when they are closely observed. It is easy to find partial resemblances to the feudal system. The relation of patron and client in the Roman republic is not unlike that of lord and vassal, in respect of mutual fidelity; but it was not founded on the tenure of land nor military service. The veteran soldiers, and, in later times, some barbarian allies of the emperors, received lands upon condition of public defence; but they were bound not to an individual lord, but to the state. Such a resemblance to fiefs may be found in the zemindaries of Hindostan, and the timariots of Turkey. The clans of the Highlanders[1] and Irish followed their chieftan into the field; but their tie was that of imagined kindred and respect for birth, not the spontaneous compact of vassalage. Much less can we extend the name of feud, though it is sometimes strangely misapplied, to the polity of Poland and Russia.[2] All the Polish nobles were equal in rights, and independent of each other; all who were less than noble, were in servitude. No government can be more opposite to the long gradations and mutual duties of the feudal system."[3]

Macieiowski, a learned civilian of our own age, discovers manifest vestiges of the feudal system among the ancient inhabitants of Tuscany.[4] To the ancient relation of patron and client, the origin of feudal tenures was traced by Budæus, one of the first lawyers in modern times who applied a very ample store of classical erudition to the illustration of Roman jurisprudence.[5] The same opinion was adopted by Zasius, but it has deservedly been rejected by most of the subsequent commentators; nor is it easy to acquiesce in the speculation of Connanus, who deduces the principles of this law from the fraternities of Soldurii among the ancient Gauls.[6] The assignment of lands by the Roman emperors makes a nearer approach to the proper point. After Augustus had supplanted his rivals, he parcelled certain lands in Italy among his veteran soldiers; and to the classical reader it is well known that, upon this occasion, Virgil was deprived of his little patrimony. The example was followed by other emperors. Alexander Severus allotted to officers and soldiers various lands which had been acquired on the frontiers, and which were to descend to their heirs on the condition of performing military service. This was a plan for securing a permanent guard in the outposts of the empire; and, as Taurellus and Gothofredus have remarked, it bears some resemblance to the feudal system;[7] but Hotman has very clearly pointed out the distinction between these military retainers and the feudal vassals.[8]

Sir Thomas Craig has not overlooked the strong resemblance between the feudal tenures and the Turkish timars.[9] "The Spahyes," says Dr Thomas Smith, "are another great support of the Turkish empire; soldiers who are obliged to serve on horseback by the tenure of the lands (*timars*) and estates they are possest of; these being not only the reward of their sweat and blood, but ties and obligations to further service in the field upon the first summons; each bringing so many horses with him according to the value of what he holds, which is the reason they do not receive an asper of pay out of the Grand Signior's exchequer, and are therefore known by the name of Timar-Spahyes, or *Feudatory*, to distinguish then from other Spahyes who live in the cities, and have not obtained a piece of land."[10] A more recent author represents this military establishment as still unchanged. "These," says Dr Walsh, "are a kind of feudal cavalry, possessing hereditary lands, on the tenure of appearing in the field when called on. If they have no male children, the lands devolve to the commander, who assigns them to others on the same terms, and so the corps is kept up. It consists of sixteen legions; who are perhaps the best mountain horsemen in the world."[11] Major Denham discovered traces of the same system at Bornou in the interior of Africa. "The feudal law," as he informs us, "exists here in full force; and a man unwilling to serve, provides one or more substitutes, according to his means."[12] Here however we have but an inadequate representation of the feudal system. In the centre of India, this system is to be found in a more complicated and perfect form. Of its present character and condition in Rajasthan, some very curious and interesting details have been furnished by Lieut. Col. Tod, who supposes Asia to have been the cradle of feudalism. "The perfection of the system in England," he remarks, "is due to the Normans, who brought it from Scandinavia, whither it was probably conveyed by Odin and the Sacasenæ, or by anterior migrations,

---

[1] "They are at present," says Dr Smollett, "as free and independent of their chiefs as the law can make them; but the original attachment still remains, and is founded on something prior to the feudal system, about which the writers of this age have made such a pother, as if it was a new discovery, like the Copernican system. Every peculiarity of policy, custom, and even temperament, is affectedly traced to this origin, as if the feudal constitution had not been common to almost all the nations of Europe. For my part, I expect to see the use of trunk-hose and buttered ale ascribed to the influence of the feudal system." (Miscellaneous Works; vol. vi. p. 275.)

[2] With respect to the state of vassalage in those two countries, consult Mr Coxe's Travels into Poland, Russia, Sweden, and Denmark, vol. i. p. 118. 137. vol. ii. p. 93. 110. Lond. 1784, 2 vols. 4to.

[7] Taurelli de Militiis ex casu, ad Ant. Augustinum Epistola, p. 83. Gothofredus ad Cod. Theodos. lib. vii. tit. xv. p. 305. "Quæ pleraque ad feudorum naturam proxime accedunt," says this most able commentator. Haloander supposes feuds to be mentioned in the Novels under the name of *militiæ*. "Animus erat in finem adjicere Feudorum Consuetudines, quas veteres appellare solebant jura militiarum, et Imp. nominat στρατειας." See his dedication prefixed to *Novellarum Constitutionum Dn. Justiniani Principis, quæ exstant, et ut exstant, Volumen.*" Norembergæ, 1531, fol. This opinion has however been refuted by different writers. "Militiæ enim," says Contius, "fuerunt officia certa ministris magistratuum assignata, quæ pecunia vendi poterant, et ideo in commercio erant, ut fuit officium apparitorum. Apparet ergo multum differre militiam a feudo. Nam militia est jus personæ; feudum in rebus immobilibus et quasi in possessione consistit." (Fornerii et Contii Tractatus de Feudis, p. 84. Leovardiæ, 1694, 8vo.)

from Asia; which would coincide with Richardson's hypothesis, who contends that it was introduced from Tartary. Although speculative reasoning forms no part of my plan, yet when I observe analogy on the subject in the customs of the ancient German tribes, the Franks, or Gothic races, I shall venture to note them. Of one thing there is no doubt—knowledge must have accompanied the tide of migration from the east: and from higher Asia emerged the Asi, the Catti, and the Cimbric Lombard, who spread the system in Scandinavia, Friesland, and Italy."[1] Nor was this system confined to the continental part of Asia: Molina informs us that it prevailed to a great extent in the island of Japan.[2] That the germ of the feudal system first appeared in Asia, is at least highly probable. Its earliest traces have been discovered among the Gothic tribes of Europe. Successive swarms of Goths moved towards the north-western parts of the old world; and when they had subdued many different nations, it may be presumed that they settled the conquered provinces according to some general plan which they had learned in the east. Of the Asiatic tribes it is one great characteristic to adhere, from one century to another, to the customs of their ancestors. This remark is signally verified in the history of the Chinese and Hindus; and it seems applicable to all the other tribes of men who inhabit that quarter of the globe.

Of the early progress of the feudal system, so able a delineation has been given by Dr Stuart, that we are here tempted to introduce a long extract from his work. Having quoted a passage from Tacitus,[3] he proceeds with the subsequent commentary. "This passage abounds in instruction the most important. It informs us that the German had no private property in land, and that it was his tribe which allowed him annually for his support a proportion of territory; that the property of the land was invested in the tribe, and that the lands dealt out to individuals returned to the public, after they had reaped the fruits of them; that, to be entitled to a partition of land from his nation was the distinction of a citizen; and that, in consequence of this partition, he became bound to attend to its defence, and to its glory. With these ideas, and with this practice, the Germans made conquests. In conformity therefore with their ancient manners, when a settlement was made in a province of the empire, the property of the land belonged to the victorious nation, and the brave laid claim to their possessions. A tract of ground was marked out for the sovereign; and, to the inferior orders of men, divisions corresponding to their importance were allotted. But while, in their original seats, such partitions were annual, it was expedient that they should now be invested in the possessor. A more enlarged idea of property had been gradually unfolding itself; and though it was convenient to, and suited the views of a narrow community, to take back its land, the measure was not practicable in an extensive society. Nations were no longer to shift their habitations. The boundaries of particular states were to be respected. The tribe ceasing to wander, the individual was also to be stationary. The lot or partition now received by him, was to continue in his possession, and to be an object of his industry. He was to take root, if I may so speak, in a particular spot. He was to bestow on it his affection; it was to feed and to enrich him with its produce. His family was to feel an interest in his estate; his sons were to succeed him. Heirs were to fail in the blood of the proprietor. It affected him, that the crown or a stranger should possess the subject of his toils and attentions. The powers of sale and donation came to be understood. The right of holding a landed territory with no limitation, and of disposing of it at pleasure, was known and prevailed.... When we mount up to the origin of customs, we are to be struck with their simplicity. The lot or partition to the sovereign was to constitute his domains. It was to support his splendour, to defray the expenses of government, and to maintain his household. The lot or partition to the individual was to give rise to allodiality. It was the land which was free, in contradistinction to tenure; and, being still the mark of a citizen, it subjected him as in Germany, to the general obligation of taking arms in defence of the community.[4] But the domains of the sovereign, and the lands of lot or partition to the people, could not exhaust all the territory of a conquest. They were principal and natural objects of attention; yet, after their appointment, there were much extensive property, and many fair possessions. The ancient maxims of the people did not allow them to seize these by a precarious occupation. Men who had connected the property of land with the tribe, and not with the individual, could not conceive any title in consequence of which they might arrogate possessions to humour their fancy, or to flatter their pride. Their ancient notions continued their operation: the community was concerned with what no man could claim. The lands accordingly which were assigned neither to the sovereign nor to the people, which formed not the domains of the former, nor the partitions of the latter, were the lands of the state or the fisc."[5]

[2] "Illud obiter dixerim, apud Japonenses nil videri esse frequentius quam feuda. Cum enim bellis perpetuo in ea ingenti insula principes inter se contendant, antiquo inter eos more, quæ unusquisque bello obtinet, continuo dividit inter suos duces, et alios quos diligit, cum onere sibi serviendi in bello, et alia onera præstandi; mutatque dominos de uno loco in alium, auferendo ab eis quæ possidebant, et alia eis largiendo. Majores autem dinastæ sub supremo aliquo principe ita constituti, divisa habent loca, quibus dominantur, in alios sibi inferiores, cum eisdem oneribus sibi inserviendi in bello et præstandi alia realia onera, et illi in alios, quousque devenitur ad infimos *tonos*, quos ipsi vocant, qui similiter dominantur unusquisque in suo oppido, et simili fere lege, ut vassalli ipsum comitentur in bellum, et servitia alia realia præstent. Mores tamen et usus feudorum non iidem, sed diversi in aliquibus sunt apud ipsos ab iis qui in Germania, Gallia, et Italia vigent." (Molina de Justitia et Jure, tom. ii. col. 1062. edit. Mogunt. 1659, 6 tom. fol.)

[3] Tacitus de Moribus Germanorum, cap. xxvi.

[4] "The allodial lands," as Dr Stuart remarks, "were enjoyed in full property, and are therefore opposed to feudal or beneficiary possessions, which were received with limitations, and under the burden of military service to the grantors." The word *al-od* is supposed to be equivalent to *all-hood*, and therefore to indicate completeness of possession. It is synonymous with *udal*, which is employed to denote the right of such lands in Orkney and Zetland; "whereby," as Lord Stair has stated, "without any infeftment, investiture, or other right or writ, they enjoy lands and hereditaments." (Institutions of the Law of Scotland, b. ii. tit. ii. § 11.) See likewise Lord Bankton's Institute of the Laws of Scotland, vol. i. p. 541. This word is evidently borrowed from the ancient Norwegian language. In the Islandic language, *ódal* signifies allodial property, but it also signifies *res derelicta*. (Haldorsonii Lexicon Islandicum, vol. ii. p. 121.) It is not therefore improbable that the term was originally applied to lands which, having been found deserted, were occupied without form or ceremony.

[5] Stuart's View of Society in Europe, p. 24.—It is not the object of this article to attempt a developement of the feudal system, but merely a faint outline of the history of the feudal law. Besides the different works which we here have occasion to quote, particularly those of Stuart and Hallam, we may refer the English reader to Dr Robertson's View of Society in Europe, prefixed to his History of Charles V.

Feudal Law.

Du Moulin has traced the origin of the feudal law to the Franks, by whom he supposes it to have been introduced into Gaul.[1] Grotius and other writers have, with greater probability, represented it as having been widely diffused at an early period.[2] Lombardy has frequently been regarded as the place of its origin, because to that country we are indebted for the ancient digest of this consuetudinary law.[3] The *Feudorum Consuetudines* are said to have been compiled by Gerardus Niger, who is likewise called Capagistus, and by Obertus de Orto or Horto, who were both lawyers and consuls of Milan.[4] They lived in the reign of Frederick the First, surnamed Barbarossa, which commenced in 1152, and terminated in 1190. Whatever share they might have in preparing the materials, it may perhaps be suspected that they did not digest the work in its present form. Their opinions are on some occasions placed in opposition to each other, and are quoted as if from distinct works. Thus in lib. ii. tit. li. § 3. "Similiter si quis investitus fuerit de feudo, ita ut ad fœminas transiret, et duas filias tantum reliquerit, quarum una filium habeat, et altera filiam; utrum post mortem illarum masculus tantum feudum habere debeat? Secundum Gerardum, masculus tantum: Obertus contra." And in § 6 of the same title: "Similiter feudum lege commissoria datum non valet, id est, si ad certum tempus pecunia non solvatur creditori, ut habeat in feudum. Gerardus. Et secundum Obertum, valet." On other occasions, both names are subjoined: "Gerardus et Obertus." It might indeed be conjectured that the work was arranged by their joint labour; and that when any difference of opinion occurred, they took care to state it in this formal manner. Du Moulin supposes Obertus to have been the sole compiler. We are assured by Odofredus, a commentator on the Code, who lived about the year 1250, that Hugolinus, otherwise called Hugo a Porta Ravennate, who died in the year 1168, added the feudal law to the ninth collation of the Novels, and that it was received as a tenth collation.[5] Some writers consider the statement as a mere device, intended to enhance the authority of this branch of jurisprudence. The feudal law is commonly subjoined to the *Corpus Juris Civilis*, of which many of the older civilians regarded it as a component part. "The last tome of the civile law," says Sir Thomas Ridley, "is the Feudes, that is, the books of customes and services that the subject or vassall doth to his prince or lord, for such lands or fees as he holdeth of him."[6] In the common editions, the *Feudorum Consuetudines* are divided into two books; but the edition of Cujacius, Coloniæ, 1588, 8vo, exhibits a new arrangement, with a series of five books. The first book he ascribes to Gerardus, the second and third to Obertus; the fourth is taken from several ancient authors, and the fifth consists of imperial constitutions relative to matters of feudal cognizance. To the common editions in two books, are likewise appended constitutions of several emperors; and two of them, issued by Henry the Seventh, are described by the term *Extravagantes;* a term which is also used in the canon law, to denote documents which wander beyond the limits of a particular collection.[7] The work itself is partly composed of such constitutions; and the entire collection closes with an instrument relative to the peace of Constance, *De Pace Constantiæ*, concluded, on the one part, between the emperor Frederick the First, his son Henry king of the Romans, and certain nobles of Germany, and, on the other, various cities of Lombardy, the march of Ancona, and Romagna.

These books of the feudal law are evidently written by individuals familiar with the doctrines and the phraseology of the civil law; and the new system of jurisprudence may be considered as a scion from the old. The composition necessarily partakes of the general barbarism of the age to which it belongs, nor are the materials reduced to a systematic or lucid form.[8] Some of the more classical civilians have therefore treated this law of Lombardy with the utmost contempt.[9] As to the authority which properly belongs to it, the feudalists have entered into much discussion, and have maintained various opinions. Some of the early writers represent it as having been sanctioned by different emperors, particularly by the first three Fredericks, but others consider this sanction as more than doubtful. Craig is induced to suppose that the feudal law must have derived its authority from some imperial rescripts, although they have not descended to our time; for he cannot conceive that the emperors would otherwise have permitted it to be taught in the schools, and observed in the judicatories. Du Moulin, on the other hand, considers the private part of the compilation as unwritten law, "jus non scriptum," adopted at Milan, and the remainder, the constitutions interspersed, as written law, "jus scriptum," retaining its force within the limits of the empire.[10] This appears to be a very sound opinion; nor do we think it necessary to mention the various suggestions and speculations of other writers. In many different countries, this compilation has been received and partly adopted as consuetudinary law, and in all those countries has been modi-

[8] "Stilus forensis est, qualis jurisconsultorum ejus temporis esse potuit: scripti enim sunt seculo inerudito, neque fieri potuit quin aliquod ejus seculi vitium contraxerint. Verba ipsa Latina, nisi si quæ sint fori propria. Phrasis, sive, ut grammatici loquuntur, constructio Longobardica est, ut facile quivis sine interprete sensum percipere potest. Tumultuarie sane sunt conscripti, ex adversariis sive schedis Gerardi et Oberti relictis, ab alio puto quam ipsis collectis. Obertus enim et Gerardus, prout quæque facti species occurrerat, consulti quid de eo sentirent, scripto declararunt. Hæc eorum adversaria, post eorum excessum, aliquis juris feudorum studiosus in libros redegit, sine delectu, sine methodo, quod non est negandum: ita tamen eorum responsa celebrata sunt, et in honore habita, ut pro jure certissimo a posteris adhuc sint usurpata." (Cragii Jus Feudale, p. 36.)

[9] "Feuda postremo," says Taurellus, "quæ non minus barbaro quam inepto, et sibi parum constanti, ac vix meo judicio legi digno volumine continentur." (De Militiis ex casu, ad Ant. Augustinum Epistola, p. 81.) See likewise Gravinæ Origines Juris Civilis, p. 103. edit. Mascovii.

[10] Molinæi Commentarii in Parisienses Consuetudines, p. 24.—See likewise Duck de Usu et Authoritate Juris Civilis, f. 35. b. Bitschii Commentarius in Consuetudines Feudorum, p. 14. G. A. Struvii Syntagma Juris Feudalis, p. 30.

fied by tacit usage, or by express enactments, nor has it any other authority except such as it has thus obtained. The Lombardic body of law is described as "Feudorum Consuetudines," and "Jus Feudale commune;" the first title denoting that it is consuetudinary or unwritten law, and the second, that it has obtained more or less authority wherever the feudal law has been adopted.

The substance of these books was digested into a new form by Antonius Minuccius a Prato Veteri, a professor in the university of Bologna, who was born about the year 1380;[1] and his labours are said to have received the sanction of the emperor Sigismund, as they certainly did that of Frederick the Third.[2] Haloander had originally intended to subjoin it to his edition of the Novels; but it was not till after a long interval that the work was first published by Schilter. Another digest of the same materials was afterwards undertaken by Bartholomæus Baraterius or de Barateriis, who was a native of Piacenza, and was successively a professor at Pavia and Ferrara. Having completed his work in 1442, he dedicated it to the duke of Milan. It was first printed at Paris in the year 1612.[3] Neither of these works seems to have obtained any permanent footing, even in the universities of Italy. The books of the feudal law were exhibited in a German dress by Dr Lorenz Weidmann, who likewise introduced some changes of arrangement. His work, *Die Lehenrecht verdeutscht*, was printed by Schoiffer of Mainz in the year 1530.

The principles of the feudal law had soon begun to be taught in the universities. The text was illustrated by many glosses and commentaries; and many summaries and treatises have from time to time been added. The principal feudalists who preceded his own time, are thus enumerated by Dr Duck: "Horum librorum authoritatem augent egregii illi jurisconsulti qui ad eos glossas, commentarios, et tractatus scripserint. Glossas in Feuda scripserunt Bulgarus, Pyleus, Ugolinus, Vicentius, Jac. Goffredus, aliique; sed Jac. Columbinus eorum ultimus omnes superavit, et post eum, ait Jason, nemo glossas in Feuda scribere tentavit.[4] Alii summas et tractatus de Feudis composuerunt, Odofredus, Jac. de Arena, Hostiensis, Jac. Ardizoni, Zasius, Rebuffus, Hannetonius, Henr. Rosenthall, aliique, qui omnem Feudorum scientiam amplissime tradiderunt. Commentarios in Feuda scripserunt Jac. de Belvisio, Andr. de Iserma, Baldus, Jac. Alvarottus, Math. de Afflictis, Fr. Curtius, Jac. Cujacius, aliique, in quibus eminet Cujacii elegantia et literarum splendor, authoritas et judicium Jac. de Belvisio et Baldi, quorum ille octies se legisse libros Feudorum Papiæ testatur, Baldus vero commentarios suos scripsit postquam jus civile per quadraginta septem annos professus insignem famam acquisiverat. Et inter hos omnes e glossographis Jacobo Columbino, e summistis Jacobo Ardizoni, e commentariis Jacobo de Belvisio primus locus ab omnibus conceditur."[5] To this enumeration some names ought perhaps to have been added, particularly those of Hotman and Vulteius. Of the more recent commentaries on the text, the most copious is that of Caspar Bitsch, professor of law in the university of Strasburg.[6] Among the systematic treatises which have appeared since the publication of Duck's very useful work, it may be proper to mention the elder Struve's *Syntagma Juris Feudalis*, which contains much information in a form not very elegant or attractive.[7] Many elementary works, such as those of Schilter, Stryk, and G. L. Böhmer, and an immense number of detached dissertations, have from time to time been published in Germany, where every province of jurisprudence is most laboriously cultivated. Of separate tracts on the feudal law, an ample collection was published in Jenichen.[8] Various writers treat of this law as it has been adopted and modified in different countries. Thus the feudal law, as applied in Scotland, has been illustrated with much learning and ability by Sir Thomas Craig, one of the greatest lawyers whom his country has produced. One of the earliest books on the law of England is Thomas Littleton's treatise on tenures; and the feudal law of that country was afterwards discussed by Sir Henry Spelman, Sir Martin Wright, Sir Jeffrey Gilbert, and various other writers.

In France the feudal law was embodied in the *loi coutumier* of different provinces; and many curious reliques of jurisprudence have thus been preserved. The most interesting of these are perhaps the *Coustumes de Beauvoisis*, digested by Philippes de Beaumanoir.[9] Montesquieu has described it as an admirable work,[10] and has quoted it upon many different occasions. "This treatise of Beaumanoir," says Mr Barrington, "is so systematical and complete, and throws so much light upon our ancient common law, that it cannot be too much recommended to the perusal of the English antiquary, historian, or lawyer. He kept the courts of the Comte de Clermont, and gives an account of the customary laws of Beauvoisis (which is a district about forty miles to the northward of Paris) as they prevailed in the year 1283. He is consequently a more ancient writer than Littleton, and, to speak with all due reverence of this father of our law, perhaps a better writer. It need hardly be said that the customs of

[9] Coustumes de Beauvoisis, par Messire Philippes de Beaumanoir, Bailly de Clermont en Beauvoisis, Assises et bons Usages du Royaume de Jerusalem, par Messire Jean d'Ibelin, Comte de Japhe et d'Ascalon, S. de Rames et de Baruth, et autres anciennes Coutumes; le tout tiré des manuscrits, avec des notes et observations, et un glossaire pour l'intelligence des termes de nos anciens auteurs, par Gaspard Thaumas de la Thaumassiere, Ecuyer, S. de Puy-ferrand, Bailly du Marquisat de Château-neuf-sur-Cher, Avocat en Parlement. Bourges, 1690, fol.—Of the *Assises de Jerusalem*, a new and complete edition, in three volumes quarto, was in 1830 announced by Cotta of Stuttgard. The editors are E. H. Kausler and J. C. Bluntschli, who promise a very careful revisal of the text, with copious and various illustrations; and, for the satisfaction of many readers, we may add that they write, not in German, but in Latin. Of the second part, the *Assise de la Court des Borgés*, the original has not yet been printed. Some extracts, relative to maritime law, may be found in Pardessus, *Collection de Lois Maritimes antérieures au XVIIIe Siècle*, tom. i. p. 275. Paris, 1828, 4to.

[10] Montesquieu de l'Esprit des Lois, liv. xxvi. chap. xv.

the two countries were at this time very similar, especially of the more northern parts of France: if we wanted other proof, the commentators on the oldest French law books cite Littleton as illustrating their customs."[1] Of the customary laws of France the other collections are very numerous.[2] Nor must we here neglect to particularize a very curious relique of early jurisprudence, the *Assises de Jerusalem*, which are decidedly of a French origin. After the conquest of the holy city in the year 1099, the barons who led the crusade elected Godefroy de Bouillon king of Jerusalem; and it was one of the new sovereign's first cares to form a body of laws for the government of his subjects. By the counsel of the patriarch, and of his princes and barons, " et des plus sages homes qu'il pooit avoir," he appointed wise men to make enquiry at persons from different countries as to the particular usages of those countries. Having received the desired information in writing, he again assembled his principal adherents; and having laid this document before them, and caused it to be read, he afterwards, with their counsel and concurrence, selected what to him seemed good, " et en fit assises et usages que l'on deust tenir et maintenir, et user au royaume de Jerusalem, par lesquels il, ses gens, et son peuble, et toutes autres manieres des gens alans, et venans, et demorans, fussent governés et menés à droit et à raison el dit royaume." They were called *Assises* from the circumstance of their having thus been confirmed in an assembly of the chief persons of the state. They were afterwards modified and enlarged by this king and his successors; and about the year 1250 were arranged by Jean d'Ibelin, Comte de Japhe et d'Ascalon, Seigneur de Rames et de Baruth. Having been adopted in the kingdom of Cyprus, they were revised in the year 1369 by sixteen individuals nominated in an assembly of the estates of that kingdom. They had been translated into Greek for the benefit of those subjects who did not understand the original language; and of this version some portions have been preserved in the Royal Library at Paris. After Cyprus had fallen under the dominion of the Venetians,[3] the book was translated into the Italian language.[4] It is generally admitted that the laws thus adopted in the kingdoms of Jerusalem and Cyprus, were in a great measure derived from the customs and usages of the kingdom of France.

The feudal system seems to have arrived at maturity during the reign and in the dominions of Charlemagne and his immediate successors. The reliques of their legislation are to be found in the *Capitularia Regum Francorum*, of which we have given a separate account. As the empire of Charlemagne not only included France and Germany, but likewise a great portion of Italy, and some portion of Spain, a certain uniformity of laws and usages was naturally promoted by this political union. " Feudal tenures," it is stated by Mr Hallam, " were so general in the kingdom of Aragon, that I reckon it among the monarchies which were founded upon that basis. Charlemagne's empire, it must be remembered, extended as far as the Ebro. But in Castille and Portugal they were very rare, and certainly could produce no political effect. Benefices for life were sometimes granted in the kingdoms of Denmark[5] and Bohemia. Neither of these, however, nor Sweden,[6] nor Hungary, comes under the description of countries influenced by the feudal system. That system, however, after all these limitations, was so extensively diffused, that it might produce confusion, as well as prolixity, to pursue the collateral branches of its history in all the countries where it prevailed."[7] The prevalence of the feudal law in Lombardy has already been mentioned; and it sooner or later extended its influence to almost every corner of Italy, including the islands as well as the continental states.[8] In England and Scotland it struck a very deep and vigorous root. Its progress in the former country seems to be correctly stated by Blackstone. " This feudal polity," he remarks, " which was thus by degrees established over all the continent of Europe, seems not to have been received in this part of our island, at least not universally, and as a part of the national constitution, till the reign of William the Norman. Not but that it is reasonable to believe, from abundant traces in our history and laws, that even in the times of the Saxons, who were a swarm from what Sir William Temple calls the same northern hive, something similar to this was in use; yet not so exclusively, nor attended with all the rigour that was afterwards imported by the Normans. For the Saxons were firmly settled in this island, at least as early as the year 600; and it was not till two centuries after, that feuds arrived to their full vigour and maturity, even on the continent of Europe."[9] Craig supposes the feudal law to have been established in Scotland before it was established in England;[10] but this is an opinion which apparently must continue to rest on conjecture, and not on historical evidence. (D. I.)

Edinb. 1779, 8vo. Lord Kames, whose speculations often rest upon a very insecure foundation, is pleased to express himself in the following terms: " I entertain some doubts whether the feudal law was introduced into Scotland so early as in the reign of Malcolm II. What to me brought this thing first under suspicion, is a fact that can be made extremely evident. When one dives into the antiquities of Scotland and England, it will appear that we borrowed all our laws and customs from the English. No sooner is a statute enacted in England, but, upon the first opportunity, it is introduced into Scotland; so that our oldest statutes are mere copies of theirs. Let the Magna Charta be put into the hands of any Scotsman, without giving its history, and he will have no doubt that he is reading a collection of Scots statutes or regulations. Now it is a point settled among the best English antiquaries, that the feudal law was introduced into England by William the Conqueror. I need not spend time upon this topick, after what is said by the accurate Spelman, and by our countryman Craig. Joining these two things together, a strong presumption arises, that the feudal law made its progress from England to this country, as all the English statutes, making improvements and alterations upon it, certainly did. But this presumption receives additional force,

FEVER is the term applied to a class of diseases characterized generally by increased heat of surface, frequency of pulse, and disturbance of the various functions. All fevers, whatever be their nature, usually commence with general feelings of illness, such as restlessness, irritability, languor, pain in the back and all the joints, sensations of coldness, even though the body may feel hotter than usual, generally terminating in shivering more or less severe; the features assume a peculiar and shrunken appearance, and the eye is muddy and more or less injected. This *cold* stage is usually followed by a hot one, when the skin has a dry burning sensation, with hot dry tongue, increased pulse, &c.; and this stage again terminates in a more or less copious sweating, which forms the third stage of the disease. These three stages may be passed through in one day, after which the person may be restored to health. The malady is then termed a "weed" or ephemeral fever. On the other hand, these three stages may recur day after day at stated intervals, when the disease is styled an intermittent fever. The malady, however, may continue many days without being marked by the occurrence of remissions or intermissions, when it is termed a continued fever. When this last form is attended with marked eruptions or rashes on the skin, the disease receives the name of an eruptive fever. Fevers are hence conveniently divided into three distinct classes. 1. Continued fevers, as typhus; 2. Periodic fevers, as ague and yellow fever; 3. Eruptive fevers, as smallpox, measles, and scarlet fever.

Of all classes of disease fevers are the most common, and not only attend in one or other of their forms almost every derangement and injury of the human body, but by their mortality they constitute one of the chief outlets of life. When they rage as endemics or epidemics they are among the most severe and fatal of diseases. In intertropical regions, after the subsidence of the rains, when the almost vertical sun causes the malarious exhalations to arise in prodigious quantities, all the low-lying districts become so unhealthy that no white man exposed to their influence escapes fever in one form or other, and even the black races suffer severely.

All fevers when they appear as epidemics seem to have certain features in common, whether they belong to the class of continued, periodic, or eruptive fevers. Thus the virulence of all is increased by the want of cleanliness and of ventilation in the dwelling, by the overcrowding in a confined space or dwelling, by the want of personal cleanliness, by the use of indigestible or unwholesome food, by residence in a damp low-lying locality, or where exhalations from damp ground, from putrescent heaps, from marshes, drains, or ditches abound. Hence the prevalence of fevers in all marshy districts; hence the mortality from fevers in armies when kept long encamped on the same spot of ground; hence the ravages of fever among our overcrowded and under-fed lower classes, and among the Irish in the late fever epidemics. A certain elevation of temperature, combined with the miasmatous exhalations from damp grounds, appears to be necessary to the existence of certain forms of fever. Thus yellow fever north of the equator only breaks out after the heavy rains of July and August, when the ground, saturated with the heavy rains, begins to throw off copious exhalations under the influence of the almost vertical sun. It scarcely ever appears where the mean temperature of the months during which it breaks out is below 70° Fahr., or where the ground is 2500 feet above the level of the sea; hence it chiefly appears only during the months of September and October. South of the line, the corresponding period when this deadly fever prevails is March and April; and at these periods all low marshy coasts ought to be avoided by whites, as this disease falls with especial severity on them. In more temperate climes, or during the other months of the year in intertropical regions, intermittent fevers (or agues) of more or less severe type, seem to take the place of yellow fever; while typhus fever is the peculiar epidemic of crowded towns and of localities ill-ventilated, ill-drained, or exposed to the miasmata arising from decomposing animal or vegetable matter, in the more temperate regions of the earth.

Much may be done by draining and ventilation for the prevention of fever; and many instances are recorded where both typhus and yellow fever have been almost quite extirpated by improved drainage and ventilation. A large tenement in Glasgow, formerly notorious as a nest for typhus, is an instance of the first, and New York and several towns in North America are instances of the other.

As fevers form the especial scourge of adult life, the means of preventing these attacks merit much attention; and were sanitary measures more rigidly enforced in all our towns it cannot be doubted that the misery, destitution, suffering, and orphanage which prevail so much among the lower classes would be greatly diminished.

FEVRE, Tannegui Le, a distinguished French scholar, was born at Caen in Normandy in 1615. The numerous difficulties which opposed his early education he overcame by his own diligence and ability, and was at length enabled to enter the Jesuit College of La Flèche, where he greatly distinguished himself. Refusing to take orders in the Romish Church, he left Normandy for Paris, where he was appointed by Richelieu inspector of the press of the Louvre. After the Cardinal's death he retired to Langres and finally to Preuilly, where he openly professed the doctrines of the Reformed faith. He was immediately offered a chair in the Academy of Saumur, which he shortly afterwards exchanged for a more eligible appointment in Heidelberg. In this latter city he died Sept. 12, 1672. Le Fèvre is perhaps fully better known as the father of Mme. Dacier than from the merits of his editions of some of the classics.

The following list contains the most important of these works:—Editions of several works of Lucian; Longinus's *Treatise on the Sublime*; the Fables of Phædrus; Lucretius; the *Histories* of Ælian; Eutropius, Justin, Terence, and Horace; the *Library* of Apollodorus; Virgil; the *Panegyric of Trajan* by Pliny the younger; Dionysius of Alexandria, Anacreon, and Sappho; French translations of the *Festinus* of Xenophon, the *First Alcibiades* of Plato, the *Treatise on Superstition* by Plutarch, and the *Life of Aristippus* by Diogenes Laertius; the translation into Latin verse of the *Fables* of Lokman; *Diatribe Fl. Josephi de Jesu Christo testimonium suppositum esse*; *Epistolarum partes II.*, Saumur, 1659, 1665, in two vols. 4to; *Les Vies des Poëtes Grecs*, 1665, in 12mo, to which is subjoined *Le Mariage de Belfégor*, translated from the Italian of Machiavelli, and the Life of Theseus, translated from the Greek of Plutarch; *Méthode pour commencer les Humanités Grecques et Latines*, in the *Mémoires de Littérature* of Sallengre; *Notes* on the *Scaligeriana Prima*. (See *Mémoires pour servir à la Vie de Tannegui Lefevre*, by Fr. Graverol, 1686; and the *Mémoires de Nicéron*.)

FEZ, an extensive country of Africa, and at one time the most flourishing kingdom in the northern part of that continent. It now, however, forms a province of the empire of Marocco.

Fez, or Fas, the capital of the above kingdom, was built in 793 A.D., by a prince named Edris, and having soon risen to be a city of the first magnitude, became the capital of the western Mohammedan states. In the twelfth century it is said to have contained seven hundred temples and mosques, and other public edifices, a number of which were erected upon a magnificent scale, and adorned with a profusion of marble pillars. It was at one time held in the

when it is considered, that if we had the feudal law before it came into England, it must have been taken from some other people than the Normans, with whom we had no commerce." (*Essays upon several subjects concerning British Antiquities*, p. 4. Edinb., 1747, 8vo.) Of such random assertions as these, it would be superfluous to attempt a formal refutation.

highest veneration; and when the road to Mecca was shut up, in the tenth century, pilgrimages to Fez were performed by the western Moslems, who considered it as a place nearly equally sacred with that where the Prophet had been born. It was also distinguished for its learning, at a time when the Saracens may be said to have enjoyed a monopoly of all the knowledge which then existed. Its schools of philosophy, medicine, and astronomy, were famous throughout the Mohammedan kingdoms of Spain and Africa, and were not only resorted to by the youth of these countries, but likewise by Christians. When the Moors were driven out of Spain, Fez became the resort of numerous refugees, who, being superior in knowledge and civilization to their original countrymen, introduced several of the arts, the practice of which for a time retrieved the decaying fortunes of the city. But it gradually sunk with the declension of arts and wealth in Northern Africa; and when the kingdom of which it was the capital became incorporated with the empire of Marocco, it ceased to possess almost any political importance. Fez is situated in a funnel-shaped valley open only on the N. and N.E., and drained by one of the upper branches of the Seboo River, in N. Lat. 34. 6. 3., W. Long. 4. 58. 15. The vicinity is fertile and well cultivated, being covered with fields, gardens, and orange-groves. Fez consists properly of two parts, the old and the new town, the latter standing on a height and overlooking the former. In old Fez the streets are narrow, unpaved, and dirty, especially in rainy weather; and from the great height of the houses, are dark and gloomy. They are crossed at different intervals by high walls, which prop up the bulging and leaning walls of the buildings on each side. These cross-walls are perforated with arched passages, which being closed at night cut off all communication between one part of the city and another. The houses are built around court-yards, and have a mean and ruinous appearance. The windows are either very small or they are altogether wanting. The different stories are surrounded with galleries supported by colonnades, by means of which the adjoining rooms communicate. The new town is better laid out and built than the old one, and contains several palaces, numerous mosques, and other public buildings. The palace of the sultan is composed of a great number of court-yards which serve as entrances to the apartments. Fez at present contains about 100 mosques, which are all built on a uniform plan. They consist of a court-yard surrounded with arcades, and having on the S. side a covered square. The chief mosque, called *El Carubin*, was built during the flourishing period of the city, and is described by Leo Africanus as being a mile and a half in circumference. It possesses a great number of arches and gates, upwards of 300 pillars, and two handsome fountains in the court. The minaret contains globes and astronomical instruments brought from Europe, but they are now neglected, and most of them useless. The mosque dedicated to Edris, the founder of the city, is much frequented, and is a sanctuary for thieves and murderers. The public baths are numerous, and the city is abundantly supplied with water. The various trades and the different articles sold are divided into classes in separate streets, so that a whole street is occupied by those pursuing one traffic or art. Provision markets are numerous, and the inhabitants of the surrounding country daily resort in great numbers to the town as to a fair. Fez is still considered one of the principal seats of Mohammedan learning, and has schools attached to many of the mosques.

The manufactures of Fez consist of woollen *hhaïks*, sashes, and silk handkerchiefs, slippers of good leather, which they tan remarkably well, red felt caps, some coarse linen cloth, fine carpets, a curious kind of earthenware, weapons of several kinds, saddlers' ware, jewellery, and copper utensils. The arts here find little encouragement, and are indeed far inferior to those of Europe, except in the preparation of leather, and in the fabrication of carpets and of hhaiks, which the manufacturers know how to weave as fine and as transparent as gauze. They are also expert workers in wax, weapons, and harness. The heat during the summer is very great; but in other seasons of the year, particularly winter, the climate is agreeable. With regard to the number of inhabitants, much difference of opinion prevails among travellers.

FEZZAN, a country of considerable extent in Northern Africa. Its northern boundary is the village of Bonjem, which, according to Dr Vogel, is situated in Lat. 30. 34. 58. N. South of this point it extends six degrees and a half of latitude, or about 450 miles, and is bounded in that quarter by what are called the Wells of Meshroo. To the south and south-east is the country of the Tibboos, to the south-west that of the nomadic Tuaricks, and to the north-west the borderers are Arabs. Of this tract of country it is calculated that about 300 miles, stretching from north to south, are cultivated. The greatest breadth is estimated at 350 miles, the Black Haratch to the east and other deserts to the south and west being included in its territory. Fezzan may be said to consist of a chain of verdant islands embosomed in an ocean of sand. Fine yellow sand, and a species of gravel, cover the whole surface of the plains, except where the Soudah and Haratch extend. It is only in the immediate neighbourhood of towns that the palm is cultivated, and that corn and esculent plants, of which a little is raised with great difficulty and labour, are produced. The plains of the desert consist of red sand and sandstone, containing gypsum and rock-salt, associated with beds of dolomite and carbonate of lime. Soda, alum, saltpetre, and sulphur, are also found in this country.

In order to convey as clear and intelligible a view of Fezzan as possible, we shall follow the route generally pursued by travellers in proceeding from Tripoli to Mourzouk, the capital, and thence to the other parts of the country which have been described. Bonjem is a small place with 120 inhabitants, and a few small gardens, and is only 204 feet above the level of the sea. The water of the numerous wells is strongly purgative. About half a mile beyond the walls of Bonjem, which is the northern frontier, stands a Roman castle, situated among some high sand-hills. It is of an oblong form, having in the centre of each of the walls a large arched gateway, between two strong towers. After leaving this interesting ruin, the traveller proceeds over a barren desert called Klia, the soil of which, where clear of sand, consists of gypsum intermixed with numerous shells. Twelve miles south-south-east from Bonjem is that remarkable hill called the Bazeen, 70 feet high, and consisting of limestone. Further on is a similar hill called Khayrna, resembling a tent, and 120 feet high. Twenty-two miles from Bonjem the road leads through a defile called Hormut Emhalla, or the Pass of the Army. After crossing a range of table-mountains called Elood, running north-east and south-west, it passes through a stony and very uneven plain, encircled with mountains, to the pass of Hormut Tazzet, which appears to be situated about sixty miles from Bonjem. After clearing this pass, the road opens upon a plain called El Grarat Arab Hoon. The journey now becomes harassing, on account of the scarcity of vegetation and water, and the frequency of sand-winds. The first place of importance that is met with on this route is Sockna, near which are a plantation of palms and two wells of fresh water.

Sockna, which is about half way between Tripoli and Mourzouk, is situated on an immense plain of gravel 1036 feet above the level of the sea. It is bounded to the south by the Soudah Mountains, at the distance of about fifteen miles; to the eastward by the mountains of Wadan, at the distance of about thirty miles; to the westward by a distant range of hills; and to the northward by the country above

Fezzan.

described. The town, which is about a mile in circumference, is walled, and contains about 2500 persons. The streets are very narrow, and the houses are built of mud mixed with small stones. The water is almost all brackish or bitter. In the immediate neighbourhood there are several hundred thousand date trees, which pay duty to the government. Sockna pays of duty annually about 2000 dollars, exclusively of a tax of one dollar on every 200 date trees. The Tripoli money is the currency of Sockna; and this occasions a considerable loss to the traders who are obliged to pay their taxes in Spanish dollars, which they purchase at exorbitant prices. The dates grow in a belt of sand, at the distance of two or three miles from the towns; and their quality is far superior to any produced in the north of Africa, in consequence of which they bring a very high price in Tripoli. In the gardens situated about three miles from Sockna, barley, maize, a small quantity of onions, and a few other garden-stuffs, are cultivated. But there is little or no other kind of vegetation, so that all the animals are fed on dates. This place is infested with an immense quantity of flies, attracted probably by the dates, which are preserved in storehouses. The men have in general a clean and neat appearance, whilst the woman are pretty and handsome, but remarkable, it seems, for their love of intrigue. The latitude of Sockna is 29. 4. 4. N., the longitude 16. 18. 30. E.

East of Sockna stands the town of Hoon. It is smaller than the former, but is built and walled in the same manner. Palm groves and gardens approach close to the walls of the town, and completely conceal it. The soil is sand, but it is fertilized and refreshed by little streams from wells of brackish water. Twelve miles east by north of Hoon stands the town of Wadan. Its external aspect is pleasing, being built upon a conical hill, on the top of which are some enclosed houses called the castle; but internally it is inferior to the two other towns in point of neatness, comfort, and convenience. There is here a well of great depth, cut through the solid rock. The bulk of the inhabitants of Wadan are *schereefs*, that is, pretended descendants of the Prophet, and Arabs who act as shepherds. A few miles eastward of the town there is a chain of mountains, which, with the town itself, derives its name from a species of buffalo called *wadan*, which is found here in immense numbers. There is also a great abundance of ostriches amongst these mountains, by hunting which many of the natives obtain a subsistence. At all the three towns, Sockna, Hoon, and Wadan, it is the practice to keep tame ostriches in a stable, and in two years to take three cuttings of the feathers.

The whole way to Mourzouk is now an almost uninterrupted succession of stony plains and gloomy wadys, with no water but that of wells, generally muddy, brackish, or bitter, and placed at widely extended intervals. Sand winds also prevail, and their visitations are at all times harassing, and not unfrequently destructive. Several towns or villages are situated in this long and dreary waste, and they are usually encircled with groves of palm. Sebha, which stands in latitude 27. 2. 34. N., and 1380 feet above the level of the sea, is a mud-walled town picturesquely situated on a rising ground, and surrounded by a palm grove. Two marches farther on lies Ghroodwa, a small and miserable collection of mud huts. The palms here, which are the property of the sultan, extend from ten to fifteen miles east and west. The leading features of the above remarkable tract of country may be shortly described. The chain known by the name of the Soudah, or Jebel Assoud, that is, Black Mountains, commences near Sockna, and extends from north to south three days' journey, but in so tortuous a direction as not, according to Major Denham, to exceed thirty-five miles in a straight line, and only twenty-five according to Dr Vogel. To the westward they extend as far as the well of Assela, on the road to Shiati, a district to the westward of Sebha, where the red clay hills continue unbroken, and unite with those of Benioleed in Tripoli. To the east they extend three days to a wady called Temelleen, which lies on the way to Zella or Zula near Barca. They form, indeed, a branch or continuation of the mountainous desert called Haratch el Assouat, which was traversed by Horneman in his route from Cairo to Mourzouk. That traveller gives a fearful description of this wild region, so much dreaded by those who have had to traverse it. The mountain presents the appearance of an imperfect cone, and the rock, upon fracture, seemed to Horneman to consist of ferruginous basalt. Range upon range of black and dreary mountains, intersected by narrow and dismal ravines rather than valleys, rose before his view. Here and there, however, the eye was relieved by the sight of patches of vegetation, approaching even to luxuriance, from the rains which fall in this hilly region. Contiguous to the Black lies the White Haratch, a chain of mountains composed of friable limestone, and abounding in petrifactions. To the south of Sockna, the description of the Jebel Assoud, as given by Major Denham, exactly corresponds to that of the Black Haratch. Dr Oudney describes the hills as from 400 to 600 feet in height, the tops being in general tabular, but a few are irregular, and two or three terminate in conical peaks. The sides of all of them are covered with a considerable quantity of debris. The Black Mountains consist of yellow sandstone impregnated with iron, from which its crust receives a black colour, appearing in the sun's rays a deep blue. Large round patches of a yellow or brown colour are often seen on these black rocks, which give to the whole a most remarkable appearance. The summits are low and flat, and the valleys mostly circular or oval-shaped hollows, whilst the sides of the mountains are in many instances overhung by pillars, curved, inclined, and perpendicular. Animal and vegetable life is entirely absent in this region, which vividly recals to mind a landscape by moonlight. The whole exhibits a scene of barrenness which, according to Major Denham, cannot be perfectly described, either by poet or painter. After these dreary wastes have been passed, the hills of Zeghren commence. They run nearly east and west, are low, long, oval, and truncated at the top, and altogether different from any others which Denham and Oudney had seen. The town of Zeghren, according to the former traveller, is better built than any other in Fezzan.

Mourzouk, the capital of Fezzan, which, according to Dr Vogel, stands in latitude 25. 55. 16. N., and longitude 14. 10. 15. E., 1495 feet above the level of the sea, is a walled town, containing about 2000 inhabitants, very much mixed. The walls are built of mud, but sufficiently thick and high to guard the place from attack. As a substitute for stones, which are not to be found, the people use baked clay, a substance which is found sufficiently durable, as rain is here unknown. The houses are generally of one story; the doors are low and without hinges, but made to move upon a pivot. The streets are small and narrow, but there are numerous open spaces, destitute of buildings, and covered with sand, on which the camels of the traders remain. Many palms grow in the town, and a few red peppers and onions are cultivated. The street of entrance is a place about a hundred yards broad, leading to the walls which surround the castle, and is extremely elegant. The castle itself is an immense mud edifice, about ninety feet in height, and furnished with small battlements immensely broad at the base, but gradually tapering to about four feet in thickness at the top. Like all the rest of the buildings, the castle has no pretensions to regularity. It is the residence of the sultan, whose apartments are of the best quality, although, on account of the enormous mass of wall, all the rooms are of very small dimensions. The more spacious houses in Mourzouk are constructed in the manner which we shall

now endeavour to describe. A large door, sufficiently high to admit a camel, opens into a broad passage, in which there is a stable, and near it a room for slaves. Opposite the stable is a large square apartment, the roof of which is supported by palm trees. In the centre of the roof is an open space, through which the apartment is lighted, for all the houses are destitute of windows. There is generally a divan or seat of mud about eighteen inches high and twelve feet long. From the sides of the large room, doors open into the smaller ones, and a passage leads into a yard which has small houses attached to it, and a well. There are sixteen mosques in Mourzouk, which are covered in, but some of these are very small. The principal one is a low building, destitute of elegance. The burying places are outside the walls, and of considerable extent. Owing to the want of wood, no coffins are used; the bodies are merely wrapped in a mat or linen cloth, and covered with palm branches, over which the earth is thrown. The men of the lower orders of Mourzouk wear a large shirt of white or blue cotton, with long loose sleeves, trousers of the same, and sandals of camel's hide; but the shirt being in general long, many have no other covering. Those of the better sort, however, attire themselves more gaily; and their dress nearly resembles that of the people of Tripoli. The men have little beard, which they mostly keep closely clipped. The dress of the women here differs materially from that generally worn by Moorish females, and their appearance is by no means prepossessing. They plait their hair in thick bobbins, which hang over the forehead, and anoint it so profusely with oil that this liquid drips down over the face and clothes. From the back hair, however, ornaments of silver or coral are suspended. Other parts of the face and head, such as the ears, are profusely adorned. A woollen handkerchief is fastened to the back of the head, and falling over, is tied by a leather strap under the chin. A blue shirt is generally worn; and a jereed and red slippers complete their equipment. Some of the better class of women wear trousers, and all adorn their persons according to their rank and importance. Both men and women have a singular custom of stuffing their nostrils with a twisted leaf of onion or clover, which has a very disgusting appearance. The natives have a variety of dances, two or three of which are peculiar to the country. In Mourzouk the luxuries of life are very limited, the people subsisting principally on dates. Many of them do not taste corn for months together; but when obtained, it is made into cakes, which are baked in ovens formed of clay in holes in the earth, and heated by burning wood. Tobacco is very generally chewed by the women, as well as by the men; but smoking is the amusement of a great man only.

The revenues of the sultan of Fezzan arise from slaves, merchandise, and dates. For every slave that enters his dominions he receives two Spanish dollars (in some years the number of slaves amounts to 4000); for a camel's load of oil or butter, seven dollars; for a load of beads, copper, or hardware, four dollars; and for one of clothing, three dollars. All Arabs who buy dates pay a dollar of duty on each load before they are allowed to remove it; an impost which, at times, is equal to the market price of the article. Above 3000 loads are sold to them annually. Date trees, excepting those of the kadi and Mamelukes, are taxed at the rate of one dollar for every 200. By this duty, in the neighbourhood of Mourzouk, or, more properly, in the few neighbouring villages, the sultan receives yearly about 10,000 dollars. Of all sheep or goats he is entitled to a fifth. On the sale of every slave he has, in addition to the head money, a dollar and a half, which, at the rate of 4000 slaves annually, gives 6000 dollars. The captured slaves are sold by auction, at which the sultan's brokers attend, bidding high only for the finest. The trees which are his private property produce about 6000 camel-loads of dates, each of 400 lbs. weight, which may be estimated at about 18,000 dollars. Every garden pays a tenth part of the corn produced. The gardens are very small, and are watered with great labour from brackish wells, as rain is unknown, and dews never fall. Pomegranate trees and fig trees are sometimes planted in the water channels. Presents of slaves are frequently made and fines levied. Each town pays a certain sum, which is small; but as the towns are numerous, the average amount may be estimated at 4000 dollars. Add to this the annual excursions for slaves, sometimes bringing 1000 or 1500, of which one-fourth are the sultan's property, as well as the same proportion of camels. He alone can sell horses, which he buys for five or six dollars, when half starved, from the Arabs, who come to trade, and cannot maintain them, and makes a great profit by obtaining slaves in exchange for them. All his people are fed by the public, and he has no money to pay, excepting to the pasha, which was formerly 15,000 dollars per annum. There are various other modes by which he extorts money. If a man dies childless, the sultan inherits the greater part of his property; and if he thinks it necessary to kill a man, he becomes his sole heir.

In Mourzouk about a tenth part of the population are in a state of slavery. There are some white families, who are denominated Mamelukes, being descended from renegades whom the pasha had presented to the former sultan. These families and their descendants are considered as noble, and, however poor and humble their situation may be, they are not a little vain of their title.

The general appearance of the men of Fezzan is plain, and their complexion is black; the women are of the same colour, and ugly in the extreme. Neither sex is remarkable for figure, height, strength, vigour, or activity; and they have a very peculiar cast of countenance, which distinguishes them from other blacks. But they are a cheerful people, fond of dancing and music, and obliging to each other. The men almost all read and write a little; but in everything else they are very dull and heavy, their affections being cold and selfish, and a kind of general indifference to the common incidents of life marking all their actions. In Mourzouk the men drink a quantity of *lackbi*, as also a liquor called *busa*, which is prepared from dates. The Arabs generally practise hospitality; but amongst the Fezzanese that virtue does not exist. They are, however, very attentive and obsequious to those in whose power they are, or who can repay them tenfold for their pretended disinterestedness. Their religion enjoins that, should a stranger enter whilst they are at their meals, he must be invited to partake; but they generally contrive to evade this injunction by eating with closed doors. The lower classes are, from necessity, very industrious; but amongst people of rank industry is not a characteristic virtue. In regard to morals, they are much upon a level with the people of Tripoli, being both dishonest and insincere. Falsehood is not looked upon as odious unless it be detected.

The lower classes work neatly in leather. They weave a few coarse barracans, and work iron in a solid although clumsy manner. A few likewise work in gold and silver with tolerable skill; and every man is capable of acting as a carpenter or mason. The wood being that of the date tree, and the houses built of mud, very little elegance or skill is required in their construction.

From the constant communication with Bornou and with Soudan, the languages of both these countries are generally spoken, and many of their words are introduced into the Arabic; but the pronunciation is very different from that of the east. Their writing is in the Mogrebyn characters; but they have no idea of arithmetic, and reckon everything by dots on the sand, ten in a line. Though very fond of poetry, they are incapable of composing it. The Arabs, however, compose a few little songs, which the

natives have much pleasure in learning. The women are kept in a state of abject subordination, as is indeed common in all Mohammedan nations. The authority of parents over their children is very great, in fact unnecessarily despotic. There are no written records of events among the Fezzanese, and their traditions are so disfigured, and so strangely mingled with religious and superstitious falsehoods, that no confidence whatever can be placed in them. Several scripture passages are selected and believed. The Psalms of David, the Pentateuch, the books of Solomon, and many extracts from the inspired writers, are universally known, and most reverentially considered.

The only towns of any consideration in Fezzan, besides those already described, are Zuela, towards the eastern frontier, on the road to Egypt; Germa, to the west; and Gatrone, on the road to Bornou. In 1822, Dr Oudney and Captain Clapperton visited Germa. It is a walled town, and surrounded by a ditch. At a little distance from it stands the remains of ancient Germa, which appears to have occupied more space than the modern town. It was formerly the capital of Fezzan, and once gave its name to the nation of the Garamantes; at least, unless there are two places of the same name, this must be the ancient Garama, which is described by Pliny as a fine city, the capital of Fazania. The inhabitants of the modern town are very poor, and many of the houses are in ruins. The aspect of the country between this place and Mourzouk is similar to that of the other portions of Fezzan which we have already described. The hills, which stand about a hundred yards apart, are composed of sandstone, finely interstratified with beds of blue and white pipeclay and alum slate. There is a valley of considerable dimensions, and also several villages. The number of date trees in the eastern and western divisions of this valley is very great. There is here a town called Khraik, situated amidst some fine groves of palm trees, and possessing cultivated patches of ground and wells of good water.

The eastern and southern portions of Fezzan were visited by Captain Lyon. In latitude 25. 55. stands the town of Traghan, which was formerly a place as considerable as Mourzouk. It is situated in a flat desert plain, with its gardens and date groves at a short distance, and contains four mosques; but most of the houses, which are large, are in ruins, and the population is very trifling. Major Denham says that carpets are manufactured here equal to those of Constantinople. The route to Zuela lies entirely through salt plains and stony deserts, with here and there a small village. Zuela, or Zuila, is situated in latitude 26. 11. 48. It was formerly a considerable place, but is now only about a mile in circumference. It contains three mosques and three gates, but there are few good houses in it. The inhabitants are nearly all white; and Captain Lyon observes, that "they are certainly the most respectable, hospitable, and quiet people in Fezzan; and their whole appearance, for they are handsome, and very neatly dressed, bespeaks something superior to the other whites." At a short distance from Zuela are some very interesting ruins, one of them a castle, which must have been a place of great strength, on account of the immense thickness of the walls. These ruined fabrics have been much commented upon, but there is nothing to prove that they were of Roman origin. The next town of any importance is Gatrone, which stands in latitude 24. 47. 57. The country between Zuela and this place is a perfect desert, which in one place consists of a singular mixture of sand and salt. Gatrone is rather pleasantly situated. It is surrounded with sand hills and mounds of earth, covered with a small tree called *athali*. On leaving this place, Captain Lyon proceeded to Tegerhy, the southernmost town in Fezzan, and situated in Lat. 24. 4. N. Here the cultivation of the date and palm ceases, and the Arabic gives place to the Bornouese language. The desert comes close to the walls of the town, which is situated to the southward of its palms. The dates are here very fine and plentiful. Tegerhy is commanded by a fort, containing wells of water within the walls. A range of low hills extends to the eastward; and near the town are some salt pools, which are frequented by snipes, wild ducks, and geese. The natives are black, and little superior to savages.

Our information on Fezzan has recently been much enlarged by the expedition under Messrs Richardson, Barth, Overweg, and Vogel, particularly as regards the north-western and western portions of the country. Dr Vogel chose the usual road by Bonjem and Sockna, already described; but the former three travellers selected the western route, by Mizda, Ghareeah, and Hessi, which is very rarely followed, as being less practicable and agreeable to travel. There the Hamâda, a frightful desert of 1400 to 2000 feet mean elevation, and 110 geographical miles in width, has to be crossed. As far as the eye can reach, neither trees nor indications of wells are visible, and the scanty vegetation which occurs is only found here and there in the trifling irregularities of the surface. The ground is covered with small stones, pyramids of which, erected with great labour, serve as road-marks to the intrepid camel-drivers by day, while the Polar star and Antares are their guides by night. This desert plateau, which it took the expedition six long days' journey to cross, forms the boundary between Fezzan and Tripoli in that direction.

The southern edge of that tableland descends in perpendicular walks to the Wady el Hessi, where the black population and the dominions of Fezzan commence. Herbage and trees are here found, affording food to numerous gazelles, hares, and the wadan. South of Wady el Hessi, which is only 696 feet above the level of the sea, follows another barren region, ascending to 921 feet, and from 40 to 50 geographical miles in width, before Wady Shiati is reached, where some wells of good water are found, and palms, wheat, and barley, with a few figs and grapes, are cultivated. Between Wady Shiati and Wady Gharbi another sandy desert intervenes of nearly 60 geographical miles in width. It is composed of black sandstone, the disintegration of which forms a dark yellow sand, covering the inequalities of the stony surface, from which stands out prominently the black rock, in high cones of the most fantastic forms, strikingly representing basaltic rocks. The monotony of the dreary black rock is relieved by the yellow sand, without which the whole of Fezzan would be a lifeless wilderness, as it is in the sand that the palm trees grow, and in the wadys filled with it that the wells are found.

Wadi Gharbi, *i.e.* Western Wady, or Wady Lashal, or the Wady, comprises the most fertile region of Fezzan. It contains complete forests of palm-trees, through which peep a number of small villages, as well as cultivated fields of wheat and barley. It opens out on the east into the Wady Shergi, or Eastern Wady, and its elevation above the sea at the village of Ogrefah is 1192 feet.

In this journey from Mourzouk to Ghat, Messrs Richardson, Barth, and Overweg went almost due west, and kept nearly on the 26th parallel as far as the valley of Ghat. They discovered some extremely curious rock-sculptures in the Wady Tilissareh, which is situated in about 25. 58. N. Lat., and 12. 8. E. Long. One of these sculptures consists of two bird and bull-headed human figures, armed with spears, shields, and arrows, and combating for a child. The other represents a fine group of oxen going to a watering-place, most artistically grouped and skilfully executed. In the opinion of the travellers, the two works bear a striking and unmistakable resemblance to the sculptures of Egypt. They are evidently of a very high antiquity, and superior to numerous other sculptures of more recent date found at the same time, in which camels generally formed the principal object. They most probably relate to a period of an-

cient Libyan history, when camels were unknown in that part of Africa, and oxen were used instead.

As far as Tilissareh the road runs in a shallow wady called Barjouj, which is fringed on both sides with extensive plains, enlivened by numerous gazelles; only at some distance to the south, and nearly parallel with Wady Barjouj, rises a high range of sandstone hills. Wady Tilissareh is about 1800 feet high, and the ground keeps ascending other 30 miles further to the west, when the western edge of the tableland of Mourzouk is reached. The road there is cut through a narrow pass, consisting of blue marl, limestone, and sandstone. It seemed to the travellers to have been purposely cut out of the solid rock for the use of man, and reminded them of a railway excavation. As they advanced it assumed the form of a cave, slightly open at the top—narrow, winding, and furnished with seats on either hand. A dim light came from above. Now and then the pass became quite a tunnel, but the concave roof being high enough for any camel to pass. Little openings, containing groups of tholukh, now and then made a pleasant impression, but the general aspect of the pass was horrible and desolate. From the gorge the plain of Taceta opens out to the west, an arid region, covered with pebbles and blocks of sandstone and limestone, and at the western end of this plain, in the meridian of 11° Long. E., the western boundary of Fezzan is considered to be.

Dr Vogel has made very interesting observations on the botany of Fezzan, the principal results of which may here be alluded to. Unfortunately the vegetation between Tripoli and Mourzouk was mostly dried up when he traversed that region, the time being the height of summer. Within Fezzan every vestige of wild plants had disappeared, save a shrubby *Tamarix* and a spinous *Papilionacea*, called agûl by the Arabs, and used as fodder for the camels. For days in succession he perceived no other plants but date-palms, under which the drifting sand of the desert, the bane of vegetation, had accumulated to a considerable height, as if attempting to bury even these trees under its deadly mantle.

Respecting the cultivated plants of Fezzan, the inhabitants grow in the gardens of Mourzouk several kinds of grain and culinary vegetables with great labour. During the winter barley and wheat are cultivated, during the summer ghussub and ghafuly. The ghafuly mozri, so often mentioned by African travellers, is the Indian corn (*Zea mais*), the spikes of which are gathered before they are quite ripe, and in this state they are roasted and eaten. So small is the agricultural produce in this part of the world that the inhabitants cover each spike of the ghussub and ghafuly abiad with a neatly-made basket, in order to prevent the wild pigeons from picking the seeds. Amongst the few trees growing near Mourzouk the finest is a *Cornus*, called kurno by the Arabs; it attains a height of 80 feet, and a thickness of about 3 feet in diameter. Its chief native land is Soudan, and the latitude of 26° N. appears to be its northernmost limit. The gum acacia enlivens and adorns the most stony sides of the valleys of the Wady Shergi and Gharbi. The gum of the trees near the roads is collected by the caravans and used as food. This article is brought in considerable quantity by the Tuaricks from the regions between Wadys Gharbi and Ghat. The senna plant, the chief native country of which is Aïr, was found by Dr Vogel in a spot near Djerma in Wady Gharbi.

In the *materia medica* of the Arabs, *Peganum Harmala*, vernacularly termed harmel, occupies a prominent place. It is used as a preventative against ophthalmia. For that purpose a dozen of its seed-vessels are swallowed by the natives in the spring, fancying that in so doing they will be exempt from all diseases of the eyes. The plant ranges from the coasts of Tripoli to Fezzan, and is very common. Another common plant is a species of *Cucurbitacea*, known by the name of colocynth, the fruits of which are eaten by the ostriches. This *Cucurbitacea* occurs in great abundance in the valleys of the Black Mountains, and forms a troublesome weed in the more fertile wadys of Fezzan. The Tibboos are very fond of the seeds; they roast them in the manner those of the pumpkin are occasionally done on the continent, after they have been previously soaked for twelve hours in water to deprive them of their bitter taste. The fruit itself is used against urinary complaints, and diseases of the sexual organs. The only ornamental flower in the small gardens of Fezzan is the sun-flower (*Helianthus annuus*), which grows to the height of eight to nine feet. There is a useful plant met with by Dr Vogel, which resembles in foliage the thorn. The bark of its root is used by the natives for tanning leather and dyeing it red; the charcoal of this shrub is used in manufacturing gunpowder. At Beniolid, in particular, the Arabs possess a great many secret powder-mills, in which an inferior article of gunpowder, for about 2s. a pound, is manufactured.

The date-palm is the most important of the cultivated plants of Fezzan. Of this tree Dr Vogel has given a complete history, of which only the following notes are extracted. All that country and half of Tripolitania are fed on that product. The huts of the poorer classes are entirely made of date-palm leaves, and the more substantial habitations consist chiefly of the same material; every door, every post, is made of date-palm wood, and the ceilings of the rooms are formed by its stems. The branches of the tree furnish the most common fuel. It is often brought from a distance of six to eight miles, a man's load consisting of two bundles, fetching about twopence. The fruit of the tree forms the food of both man and beast; camels, horses, dogs, all eat dates. Even the stones of this fruit are softened in water, and given to the cattle; for in many districts the cattle have no grass or any other herbage, except a little safshah (*melilotus*), which in Mourzouk is cultivated with almost as much care as the corn, and fetches the high price of about fourpence a bundle, which is not more than a good handful. The camels of Mourzouk are therefore often sent about 100 miles to the north to have sufficient pasture. The number of the date-palms cultivated is enormous. When Abdel Gelil besieged Sockna in 1829, he cut down no less than 43,000 trees, in order to compel the town to surrender; nevertheless there are still 70,000 left. Their produce is comparatively small, 100 full-grown trees yielding about 40 hundredweight of dates, worth at Mourzouk about 30s., but at Tripoli about four times that sum. The dates, after having been gathered, are dried in the sun, and when quite hard, buried in the sand. They may thus be preserved about two years, but generally after the first 18 months they are attacked by the worms, and in the beginning of the third year nothing is left of them but the stones. As an everyday food dates are considered very heating; in consequence they are not much used on the journey, as causing great thirst. The most relishing and wholesome way to eat them is when made into a paste, mixed with barley. When the heart of the leaves has been cut out, a sweet thickish fluid collects at that cavity, called lagbi, which is very refreshing, and slightly purgative. A few hours afterwards this fluid begins to ferment, becomes acid, and very intoxicating. From the ripe fruit a kind of treacle is prepared, used especially for coating leather bags or pipes to render them tight.

Dr Vogel also explored the celebrated Trona Lakes of Fezzan, of which he gives the following description:—

The Trona Lakes are situated in a desert of the most dreary and impracticable description, presenting a labyrinth of hills, undulations, valleys, precipices, and literally not one square yard of level ground; formed entirely of drifting sand, in which the camels sink up to their bellies. For carrying a tent and cooking apparatus, together with two water-pipes—in all about 350 lb. weight, no less than five camels

Fezzan.

were required, and nevertheless only $9\frac{1}{2}$ miles could be accomplished in eighteen hours. One of these sandhills, measured trigonometrically,—for the transport of the barometer was found impossible—was ascertained to be 530 feet above the adjoining lake. The whole of these lakes are situated along the northern side of Wady Shergi and Wady Gharbi. In the eastern portion of the former Dr Vogel found the remains of ancient towers built by the original inhabitants of Fezzan; and in Wady Gharbi, near the village of Kharaig, some extremely interesting ancient tombs. These tombs consisted of about 50 pyramids, mostly between 6 and 8 feet high, and 6 to 8 feet square at the bases, the sides corresponding precisely with the four cardinal points. Only two of these pyramids were 16 feet high. One of them was opened, and in the interior a carefully constructed tomb was discovered, with the skeleton of a child and some pearls and corals.

The Trona Lakes, and especially Bahr-el-Dood, were said to be bottomless, but Dr Vogel found the depth of the latter 18 feet at an average, and 24 feet where it was deepest. This lake contains the celebrated Fezzan worm or Dood. From the drawings sent home by Dr Vogel, Dr W. Baird of the British Museum has found it to be a species of the *Artemia* or brine shrimp, and has called it *Artemia Oudneyi*, from having been first seen and described by Dr Oudney. A full-grown specimen was measured by Dr Vogel and found to be $3\frac{7}{12}$ Paris lines (about a quarter of an English inch) in length, and $1\frac{3}{12}$ Paris lines (or about $\frac{1}{10}$ of an English inch) in breadth under the head. They are of a very pretty colour, and in their bright hues resemble those of the gold-fish. They are caught with cotton nets, in which are hauled up innumerable other insects and flies, with which the lake is filled; the whole is mixed with a red kind of date and made into a paste, which has a smell and taste similar to salt herring, and is eaten by the inhabitants of Fezzan, in place of meat, along with bazeen.

The pashalic of Fezzan is computed to contain about a hundred towns and villages, but the population is thought not to exceed 26,000. It is governed by a sultan, who, although in fact only a viceroy dependent upon the pasha of Tripoli, possesses absolute sway. In regard to climate, Fezzan cannot be considered as fortunate. In summer the heat is intense, and the south wind, which is very dry, and impregnated with sandy particles, is scarcely supportable even by the natives. The winter, on the other hand, is accompanied with a bleak and penetrating wind blowing from the north, the cold of which is painfully felt even by the natives of a northern climate. Rain falls seldom, and in small quantities; thunder is also rare, but tempests of wind frequently occur. With regard to the soil, we have already spoken at sufficient length. The revenue, as derived from sources already mentioned, is devoted solely to the maintenance of the sultan, his army, and court. The cadi and other officers of justice, the ministers of religion, and even the great officers of state are maintained from grounds set apart for this purpose, and which are covered usually with gardens, or woods of date trees. The office of cadi or chief judge, to which is also attached that of first minister of religion, is hereditary in a certain family. The military force by which the Turks hold possession of this vast but thinly-peopled territory is the very inconsiderable number of 630 men.

This country was well known to the ancients under the title of the *Phazania Regio*, and the country of the Garamantes, whose ancient capital has been recognised by Major Rennell in the modern Germa, as already noticed. The name of Fasan or Fezzan seems to have been imposed by the Saracens, when they overran Northern Africa and established the Mohammedan faith; and ever since it has continued to prevail.

Fiars Prices.

FIARS PRICES were originally instituted in Scotland for the purpose of ascertaining the value of the victual or grain rents, and feu-duties payable to the crown.

They were first ascertained by the exchequer upon the prices of grain returned by the sheriffs of counties. Afterwards it was left to the sheriffs themselves, who proceeded through means of a jury.

Chalmers, in his *Caledonia*, vol. ii., p. 317, dates the commencement of fiars in counties some time after 1617 at the earliest, but the commissary fiars were much earlier. The Commissary Court records mention them as far back as 1564. The Act 1584, cap. 22, alludes to an exchequer fiar; and there are many instances during the latter half of the seventeenth century to be found in the records of the Teind or Tythe Court, when the judge ordained payments to be made according to the sheriffs' fiars.

It is remarkable, however, that there is no act of parliament enjoining the striking or using the fiars prices, or regulating the procedure in taking the averages. The sheriffs of the several counties seem to have assumed the right of dictating the mode of procedure; consequently the manner of conducting this process is various, sometimes contradictory, and generally loose. Of late great dissatisfaction has been expressed with the manner in which the average prices of grain are ascertained, and proposals have been made for applying to parliament for an act for better regulating the fiars.

The English averages are more accurately attained. By act of parliament, there are 290 towns the market clerks of which send weekly to the general registrar in London statements of the quantity and price of all grain sold in their markets, from which the registrar makes up the weekly returns as published in the *Gazette*.

The Earl of Lauderdale, when sheriff of Edinburgh, seems to have been the first who passed an act, Feb. 22, 1722, by which he ordained the summoning of a jury of fifteen for striking the fiars, and laid down rules of procedure. But the contrariety of decisions in litigations before the civil courts relative to the fiars prices attracted the attention of the Court of Session, which passed an act of sederunt, Dec. 21, 1723, regulating the procedure in the fiars courts. It is, however, doubtful if the Court of Session had power to make such regulations; and it was afterwards acknowledged that it had no jurisdiction with regard to the sheriffs in striking the fiars, consequently the matter is now left in a great measure under the direction of the sheriffs themselves.

The mode of striking the Haddington fiars is this—the jury summoned by the sheriff takes the average of all the prices as the middle fiars, the average of all the prices above that rate is taken as the highest fiars, and the average of all the prices below the same rate is taken as the lowest fiars, and then two and a half per cent. is added to each class.[1]

In Scotland it has been found to be a fair and safe principle in letting farms on lease, that the whole or a certain portion of the rent should be paid in grain or in the *value* of so many bolls of wheat or barley, so that in the event of a great fall of prices during the currency of the lease, the tenant should not suffer, and on the other hand, that the landlord should reap a fair share of the advantage in a rise of prices. It is obviously, therefore, the interest of those who have to pay that the fiars should be struck upon a low average, whereas it is the interest of those who have to receive that the rate should be high; and it is believed that the fiars are generally a little below the true market prices.

A great many contracts are regulated by fiars prices besides grain rents. There are feu-duties payable both to the

[1] This seems to have taken its origin from there being three qualities of each description of grain in the county. The averages, as taken in Haddington, are generally higher than in the other counties of Scotland.

crown and private parties, grain teinds or tithes payable to titulars, the stipends of the Established Church clergy, which are always, as a general rule, awarded in victual (oatmeal or barley), the salaries of the parochial schoolmasters, &c.

As far as the counties of Scotland are concerned, Edinburgh may be taken as a fair average of the whole, and we have given a list of the fiars prices as struck in that county between 1740 and 1854. These prices are higher than they are in some counties, and lower than in others. They are under those of Haddingtonshire by from 5 to 10 per cent., but they may be taken as a fair average of the fiars prices over all the counties of Scotland.

The measure which was used in striking the fiars from 1740 (the earliest year in which the prices are recorded) to 1824 was the boll. The Linlithgow boll, which was used in most of the counties, was equal to 8-11ths of the imperial quarter. The Mid-Lothian boll was within a small fraction of the same. From 1825, the year when the prices ceased to be reckoned for bolls, they are given as in the following table in imperial quarters.

Fiars Prices—Mid-Lothian.

1740 is the earliest year for which the fiars prices were recorded for this county.

Year.	Best Wheat.	Best Barley.	Best Oats.	Year.	Best Wheat.	Best Barley.	Best Oats.
	Per Boll.	Per Boll.	Per Boll.		Per Imp. Qr.	Per Imp. Qr.	Per Imp. Qr.
1740	£1 2 11	£0 17 8	£0 14 6	1825	£3 0 8	£1 19 0	£1 5 2
1750	0 13 6	0 10 7	0 9 4	1826	2 16 8	1 18 0	1 7 4

The average for all Scotland in 1847 was—wheat, L.2, 12s. 5d.; barley, L.1, 9s. 7d.; oats, L.1, 2s. 7d.
The average for Mid-Lothian was—wheat, L.2, 11s. 6d.; barley, L.1, 11s. 6d.; oats, L.1, 4s. 6d.

FIBRE (Lat. *fibra*), a fine thread or filament; a fine slender body, such as those of which flesh, nerves, plants, roots, &c., are composed. In our manufactures vegetable filaments and fibres are among the most important of the whole series of raw produce; furnishing thread, cloth, cordage, and the like. For these purposes the filamentous parts of the *Gossypium*, *Cannabis*, and *Linum*, or cotton, hemp, and flax, are commonly used. The fibres of other plants have been employed in different countries for the same uses. Putrefaction destroys the pulpy matter, and leaves the tough filaments entire. Different kinds of cloth are prepared in the east from the fibres of the bark of certain trees boiled in a strong lye. Some of these cloths are very fine, and approach to the softness of silk, but in durability fall short of cotton; others again are coarser and stronger, and much exceed cotton in durability. See Botany, vol. v., p. 69, and Flax. For the chemical properties of vegetable fibre, see Chemistry, vol. vi., pp. 515, 516.

FIBRIN, a peculiar organic compound, found both in vegetable and animal substances. Fibrin is a soft solid, white, insipid, inodorous, and insoluble in water. It is procured in its most characteristic state from animal matter. It exists in the chyle and in the blood, and constitutes the chief part of animal muscle; hence it must be regarded as the most abundant constituent of animal bodies. Fibrin may be readily obtained by agitating new-drawn blood with a bundle of twigs, when it will adhere to them in long reddish filaments, which may be rendered colourless by washing in cold water. When dried, fibrin becomes semitransparent. yellowish, and brittle. It is composed of 53·36 carbon, 19·69 oxygen, 7·02 hydrogen, and 19·93 azote. Fibrin is a most important element of nutrition, and is essential to the sustenance of carnivorous animals.

FIBULA (Lat. a *clasp* or *buckle*), the outer and smaller bone of the leg; so called from its connecting and giving firmness to the other parts. See Anatomy, vol. iii., p. 37.

FICHTE, Johann Gottlieb, an eminent German metaphysician, was born at Rammenau, a village of Lusatia, on the 19th of May 1762. His father was a ribbon manufacturer, and carried on a small trade in haberdashery. A wealthy person in the neighbourhood having been struck with the extraordinary genius which young Fichte displayed, put him to school, in order to give him an opportunity of cultivating his talents; but the boy becoming impatient of restraint, ran off, and was found sitting on the banks of the Saale, with a map, on which he was endeavouring to trace the way to America. From this period he seems to have prosecuted his studies in an extremely desultory manner; occasionally attending the lectures of the professors of Wittemberg and Leipsic, without devoting his attention exclusively to any particular science. Theology, however, appears to have been his favourite study; and this predi-

lection is conspicuous in many of his subsequent writings, which are distinguished by a singular mixture of philosophical and religious mysticism. When he left the university, his situation was by no means enviable. He possessed no fortune to enable him to indulge in the luxury of philosophical speculation; and, in spite of his decided aversion to every kind of constraint, he was compelled, by the necessity of his circumstances, to accept the situation of tutor in the family of a Prussian gentleman. But his residence in Prussia enabled him to cultivate the acquaintance of the celebrated philosopher of Königsberg, to whose judgment he submitted his first work, the *Critical Review of all Revelations*, which was published anonymously in 1792. In the literary journals, this production, which had attracted considerable attention, was ascribed to the pen of Kant, until the real author made himself known.

Having received fifty ducats from a Polish nobleman, in whose family he had been tutor, Fichte set out on a course of travels through Germany and Switzerland, and afterwards married a niece of Klopstock's at Zurich. In 1793, he published the first part of his *Contributions towards rectifying the Opinions of the Public respecting the French Revolution.* This book, which is written with considerable force and originality, created a great sensation in Germany, and was violently attacked, in consequence of a new and apparently dangerous theory which the author advanced relative to the social contract. The book,however, was perused with great avidity; but the attacks to which we have alluded probably prevented him from publishing the continuation.

The reputation of Fichte was now so well established, that he soon afterwards obtained an appointment to the philosophical chair at Jena, as successor to Reinhold, who had been called to the university of Kiel. Here he commenced his lectures by a programme, in which he endeavoured to give an idea of the *Doctrine of Science* (*Wissenschaftslehre*), the name by which he distinguished the principles of that system of transcendental idealism which he afterwards more fully developed. In 1794, besides the ordinary duties of his professorship, he every Sunday gave a regular couse of lectures, in the form of sermons, *On the Literary Calling*, which was numerously attended. Having established the principles of his doctrine of science, he endeavoured to extend their application to the several departments of philosophy; and with this view he published in 1796 his *Fundamental Principles of the Law of Nature*, and two years afterwards his *System of Morals.* In conjunction with Niethammer, he also published a philosophical journal, in which some articles were inserted, containing certain philosophical views of religion, which were considered by many as tending directly to atheism. Amongst a number of objectionable propositions, it was maintained that God was nothing else than the moral order of the universe; and that to worship God as a being who could only be represented as existing in time and space was a species of idolatry. One of Fichte's colleagues called the attention of the Saxon minister Burgsdorf to these heretical propositions; and the consequence was the rigorous confiscation of the work throughout the whole of Saxony. Fichte and his friend Forberg wrote an *Appeal to the Public*, and several *Apologies*, in order to exculpate themselves from the imputation of atheism. The government of Weimar behaved on this occasion with prudence and moderation; but the celebrated Herder, vice-president of the consistory, took part against Fichte. Eberhard, on the other hand, although hostile to the metaphysical system of Fichte, undertook his defence. The controversy was carried on with great violence, and excited considerable ferment throughout the whole of Germany.

In the meantime Fichte resigned his professorship at Jena, and repaired to Berlin, where he met with a very flattering reception. Here his time was occupied in giving private lectures, and in composing his various writings. In 1800 he published a short treatise, entitled *The Exclusive Commercial State*, containing one of those philosophical systems of political economy from which the praise of ingenuity cannot be withheld; whilst, at the same time, the most cursory view of the general principles on which it is founded must be sufficient to convince us that it could never be advantageously reduced to practice.

About this period Fichte met with a formidable rival in Schelling, who had formerly been a warm partisan of the *Doctrine of Science*, but who now separated from his master, and propounded a new metaphysical theory of his own, which soon acquired a large share of popularity at the German universities, especially at Jena. Fichte indeed endeavoured to modify his theory of the *Doctrine of Science*, and to present it to the world in a new and more attractive form; but he never again recovered the sway which he had formerly exercised over the public mind. Meanwhile, his ardent wish to be again placed in an academical chair was at length gratified by M. de Hardenberg, who in 1805 procured for him the appointment of ordinary professor of philosophy in the university of Erlangen. This appointment was accompanied with the especial favour of being permitted to pass the winter at Berlin, in order to continue his lectures there. But this state of amphibious professorship, as his friends used to call it in jest, did not last long. During the summer of 1805 he delivered at Erlangen his celebrated lectures *On the Essence of the Literary Character* (*über das Wesen des Gelehrten*). The following winter he delivered to a numerous audience the course which he afterwards published under the title of *Guide to a Happy Life.* This was one of those publications in which he attempted to present his metaphysical doctrines to the public in all their sublimity, and, at the same time, with such clearness, as should render them intelligible to common readers.

The disasters which assailed the Prussian monarchy in 1806 were attended with serious consequences to Fichte. Erlangen having ceased to be a Prussian university, he did not await the entry of the French into Berlin, but fled to Königsberg, and thence proceeded to Riga. In the summer of 1807 he delivered a course of philosophical lectures at Königsberg. The peace which ensued enabled him to return to Berlin, where he pronounced his famous *Orations to the German Nation*, which were enthusiastically read and applauded throughout all Germany. When the university of Berlin was founded, he obtained, through the interest of M. de Humboldt, the situation of rector, which secured to him an honourable revenue, whilst his rank as first professor of philosophy gave him great academical influence. His health, however, had suffered considerably from the shocks he had for some time experienced, and he found it necessary to have recourse to the waters of Bohemia, from which he derived great benefit. But his wife was attacked with a nervous fever, in consequence of her attendance on the deserted sick; and although she recovered, Fichte, whose affection would not allow him to leave her for a moment, caught the infection, and died on the 29th of January 1814.

Fichte was small in stature, but stout and well formed; his countenance was expressive of thoughtfulness and determination. In his intellectual character, genius was combined with inflexible firmness; and these qualities enabled him to surmount difficulties which would have overwhelmed a man of less vigorous temperament. In other respects his dispositions were amiable and his morals correct. It was in the academical chair that the genius of Fichte was manifested in its greatest splendour. It was said of him that he was born a professor; and there was indeed a charm in his manner of lecturing which had a powerful influence on the minds of his pupils, many of whom were in the habit of talking of him with enthusiasm. His fervid and brilliant eloquence, the clearness of his reasoning, and the simplicity and correct-

ness of his language, seemed to diffuse a magic light and colouring over the darkest and most abstruse metaphysical problems. Those who were charmed with his eloquence were easily convinced by his reasoning, and became willing converts to his doctrines. His writings, especially those works in which his peculiar doctrines are propounded in a systematic form, are by no means so attractive as his lectures appear to have been. On the contrary, notwithstanding a constant affectation of strict and simple reasoning, his propositions are enveloped in such a degree of transcendental obscurity, as renders it extremely difficult to comprehend either the basis or the scope of that system of doctrines which he laboured to establish.

Hence it is far from being an easy matter to give an intelligible abstract of the principles of the *Doctrine of Science*, especially as we must necessarily presuppose some acquaintance, on the part of our readers, with the previous metaphysical labours of Kant. Fichte commenced his philosophical career precisely at that period when the writings of Kant had nearly obtained a paramount influence on the German schools, and when men even of superior talents thought it no mean glory to be able to comprehend and illustrate his doctrines. The Kantian theory was confessedly idealistic. Its celebrated author set out with an analysis of the cognitive faculty, and endeavoured to describe its various functions, as well as to ascertain the scope and limits of its legitimate exercise. All our knowledge, according to the critical philosophy, must have a reference to possible experience. Of external objects, or things in themselves (*noumena*), we can have no absolute knowledge; for we can know nothing but what is perceived by the senses, and cognized (if we may be allowed the expression) by our intellectual faculties, according to the laws peculiar to our constitution. These intellectual laws, or subjective forms, tend to combine our knowledge, and to render the field of experience a comprehensible whole. As we can have no knowledge of objects in themselves, but only of their *phænomena*, neither can we have any knowledge of things beyond the sphere of our experience, because these can neither be perceived by our senses nor subjected to the laws of the understanding. All reasoning, therefore, from mere ideas must necessarily be futile, because it has no reference to any corresponding object within the limits of experience. And although we can have no absolute knowledge of objects as they really exist, yet our knowledge of them possesses a subjective reality (that is, a reality with reference to the thinking subject), and may be said to correspond with the objects, because, from the nature of our intellectual constitution, we are incapable of receiving any other impression from them.

Reinhold was one of the earliest partisans of Kant, and one of the most ingenious and most popular commentators on the critical philosophy. But his talents were better adapted for explaining and illustrating the doctrines of others, than for discovering new truths, or inventing any original system of his own; and although an indefatigable student of philosophy, he seems to have never arrived at any settled conviction in metaphysical matters, but to have alternately adopted and abandoned every new theory which was successively presented to his view. After having been for some time enthusiastically devoted to the doctrines promulgated in the *Critical Review of Pure Reason*, which he esteemed the greatest masterpiece of philosophical genius, he at length discovered that Kant had neglected to secure the foundations of the edifice he had raised, and this defect he attempted to supply by his own *Theory of the Faculty of Perception* (*Theorie des Vorstellungsvermögens*). The main proposition laid down and illustrated in this work is nothing more or less than this: We are compelled by consciousness to admit that every perception presupposes a percipient subject and an object perceived, both of which must be distinguished from the perception to which they relate; thus referring all our knowledge to consciousness as its ultimate principle. In the enunciation of this proposition there is nothing very new or original; but the illustration of this elementary doctrine, which, as a late reviewer of the German metaphysical theories observes, might have formed an excellent subject for a short philosophical dissertation of two or three sheets, is dilated into a work nearly as large as that to which it was intended to serve as a mere introduction; nor is the unnecessary length of the treatise in any measure compensated by the importance of the truths developed, or the ingenuity displayed in the research.

With greater talents and consistency, Fichte, who announced himself as a strict Kantian, attempted to resolve the same problem, and to develop a system which, by deducing all our knowledge from one simple principle, should give unity and stability to the critical theory. In his *Doctrine of Science* (*Wissenschaftslehre*), accordingly, he derives all our knowledge from the original act of the thinking subject in reflecting upon itself. *I am I* (which he expresses by the formula $A = A$), or the absolute position of the I by the I, is in itself the certain principle of all philosophy and of all our knowledge. But the creative energy of the I, in the course of this reflective process, goes still further. By its own act, also, the I places the *not-I* (objects) as opposed to itself. In reflecting upon itself, as the absolutely active principle, it finds itself either determined by or determining the *not-I*. In the former case, it appears as the *intelligent I;* in the latter, as the *absolutely free, practical I.* Hence the distinction between theoretical and practical philosophy. The idea, then, which pervades the whole theory of Fichte is this: The I, or the thinking subject, is the absolutely active principle, which *constructs* the consciousness, and produces all that exists, by position, contraposition, and juxtaposition. The whole universe, in short, is the product of the I, or thinking subject.

We have thus endeavoured to give a very concise sketch of a theory which we shall not think of pursuing through its various ramifications, as we should despair of making it intelligible to our readers by any length of exposition. Fichte has been praised by his countrymen for his logical and consistent reasoning; but to us it appears that his theory proceeds entirely upon arbitrary assumptions, resting upon no solid foundation. That he displays considerable ingenuity in the development of his ideas we are willing to admit; but we are quite at a loss to perceive the merit of the theory he has advanced, when considered as a system of philosophical truths. The parade of scientific deduction which his reasoning exhibits may impose upon the incautious student; but a careful examination will undoubtedly convince him that the whole is a mere tissue of empty notions, derived from arbitrary and assumed principles.

In attempting to apply the principles of his doctrine of science to the theory of morals and the law of nature, Fichte exhibited many original and paradoxical opinions, along with some very just and ingenious philosophical observations. In his later writings he considerably modified his original theory of the doctrine of science, and produced a system of philosophical and religious mysticism, which appears to have given birth to the transcendental idealism of Schelling, an author who seems to have carried the extravagance of speculative reasoning to its utmost limits.

The following is a list of the works of Fichte:—*Versuch einer Kritik aller Offenbarung* (Critical Review of all Revelation), Königsberg, 1792, 1793, 8vo; *Ueber den Begriff der Wissenschaftslehre* (On the notion of a Doctrine of Science), Jena, 1794, 8vo; *Grundlage der gesammten Wissenschaftslehre* (Foundation of the whole Doctrine of Science), Ibid. 1794, 8vo; *Grundriss des eigenthümlichen der Wissenshaftslehre* (Sketch of the peculiarity of the Doctrine of Science), Weimar, 1794; *Vorlesungen ueber die Bestimmung des Gelehrten* (Lectures on the Literary Calling), Jena, 1794; *System der Sittenlehre* (System of the Doctrine of Morals), Jena and

Leipsic, 1795; *Beyträge zur Berichtigung der Urtheile des Publicums ueber die Französische Revolution* (Materials for Rectifying the Opinions of the Public respecting the French Revolution); *Grundlage des Naturrechts* (Foundation of the Law of Nature), Jena, 1796, 1797, 2 vols. 8vo; *Appellation an das Publicum ueber die ihm beygemessenen atheistischen Aeusserungen* (Appeal to the Public respecting the atheistical expressions imputed to him), Jena and Leipsic, 1799; *Ueber die Bestimmung des Menschen* (On the Destiny of Man); *Der geschlossene Handlesstaat* (The exclusive Commercial State); *Sonnenklarer Bericht an das grössere Publicum ueber das eigentliche Wesen der neuesten Philosophie* (Luminous Report to the greater public on the peculiar Character of the modern Philosophy), Berlin, 1801; *Wissenschaftslehre* (Doctrine of Science), Tübingen, 1802, 8vo; *Vorlesungen ueber das Wesen der Gelehrten* (Lectures on the Literary Character), Berlin, 1806; *Die Grundzuge des gegenwärtigen Zeitalters* (The Characteristics of the Present Age), Ibid. 1806; *Anweisung zum seligen Leben* (Guide to a Happy Life), Ibid. 1806; *Reden an die Deutsche Nation* (Discourses to the German nation) Ibid. 1806; *Die Wissenschaftslehre in ihrem allgemeinsten Umrisse dargestellt* (The Doctrine of Science exhibited in its most general outline), Ibid. 1810; *Freidrich Nicolai's Leben und Sonderbare Meinungen, herausgegeben von Schlegel* (Life and singular opinions of Frederick Nicolai, edited by Schlegel), Tübingen, 1801; *Antwortschrieben an K. L. Reinhold, auf dessen Beyträge zur leichtern Uebersicht des Zastandes der Philosophie*, &c. (Answer to K. L. Reinhold, on his Materials for acquiring a more easy View of the State of Philosophy, &c.), Tübingen, 1801; *Ueber die einzig mögliche Störung der academischen Freyheit* (On the only possible disturbance of Academical Freedom), Berlin, 1812; *Ueber den Begriff des wahrhaften Kriegs, in Bezug auf den Krieg in jahre*, 1813 (On the notion of real war, with reference to the war in 1813), Tübingen, 1815.

Fichte is also the author of several essays in periodical publications, and particularly in a philosophical journal edited by himself, with the assistance of Niethammer.

Those who are desirous of obtaining more minute information respecting Fichte's philosophical theory, may consult the following works: Tennemann's *Grundriss der Geschichte der Philosophie*; Degerando, *Histoire Comparée*, &c. W. T. Krug, *Briefe ueber die Wissenschaftslehre*. F. W. J. Schelling, *Darlegung des wahren Verhältnisses der Naturphilosophie zu der verbesserten Fichtischen Lehre*. J. Fries, *Reinhold, Fichte und Schelling*. C. F. Bachmann, *Ueber die Philosophie meiner Zeit*. Ancillon, *Essai sur le premier problème de la philosophie*; and *Essai sur l'existence et sur les derniers systèmes de métaphysique qui ont paru en Allemagne*. (J. C.)

FICHTELGEBIRGE, a mountain group of Germany, in Bavaria, forming the centre from which three extensive mountain ranges proceed,—the Erzgebirge in a N.E., the Frankenwald in a N.W., and the Böhmerwald in a S.E. direction. The streams to which it gives rise flow towards the four cardinal points,—*e.g.* the Eger flowing eastward and the Saale northward, both to the Elbe; the Main westward to the Rhine, and the Naab southward to the Danube. The chief points of the mass are the Schneeberg and the Ochsenkopf, the former having a height of 3433 and the latter of 3340 feet.

FICINO, Marsilio, a distinguished Italian scholar, was born at Florence in 1453. Instead of devoting himself, as the fashion of that age was, to the study of Aristotle, he selected Plato as his favourite author; and may be considered as the restorer of that philosopher's doctrines in the west. He translated the whole of his works into Latin, besides portions of those of his most celebrated followers, such as Plotinus, Proclus, Porphyrius, and Jamblicus. He died at Correggio in 1499; and we are informed by Baronius that after his death he appeared to his friend Michaele Mercato, to whom he had promised to manifest himself as a confirmation of his doctrines regarding the immortality of the soul. His collected works appeared first at Venice in 1516, and were afterwards reprinted at Basil and at Paris.

FICUS, a large genus of urticaceous plants, in which the male and female flowers are mixed indiscriminately on the inside of a hollow, turbinate, fleshy receptacle. The genus comprehends the various species of fig-trees, which are all either tropical or inhabitants of warm countries. Some of these are shrubs or small creeping plants; while others are among the largest trees of the forest. The species of *ficus* have alternate leaves and branches, and secrete a milky juice more or less acrid, and which exists even in the common eatable fig in its unripe state. Upwards of 100 species are known, of which the following are among the most interesting.

1. *Ficus Carica*, a small tree which produces the common eatable fig, is a native of Asia, Africa, and the south of Europe, and has been cultivated from remote antiquity on the shores of the Mediterranean. This tree grows from 15 to 25 feet high, and the trunk sometimes attains a diameter of two feet. It has rough, lobed, deciduous leaves; the flowers are minute, unisexual, and contained in great numbers in a common receptacle, which is fleshy, turbinate, and almost closed at its apex. The male flowers (which are comparatively very few in number) occupy the superior part of this receptacle, while the lower and all the remaining part is filled with the female flowers. It is this receptacle, with its multitude of minute flowers imbedded in the pulp, which when ripe constitutes the well-known fruit. In its fresh state the fig is generally of a purplish hue, and has a soft, sweet, fragrant pulp. At least fourteen varieties are cultivated in this country, generally under glass, or in warm sheltered situations. As the cultivated fig-tree bears, for the most part, female flowers only, an artificial method of fertilizing them is resorted to in the Levant. This is the interesting process called *caprification*. The fact of this artificial impregnation is mentioned by Aristotle, who observed that a certain insect was generated on the flowers of the caprifig (wild fig), which, having become a fly, entered the unripe fruit of the domestic fig and caused it to set. Tournefort and other travellers describe the process of caprification as practised in the Levant as follows:—At a particular season branches of the wild fig are placed among the cultivated trees, and the fertilizing pollen of the wild plant is conveyed by the legs and wings of these insects (a species of *Cynips*) into the interior of the receptacle. To insure success, it is requisite to observe the proper period for this operation, which should be performed just before the insects will be ready to take wing, otherwise they might be lost. The same artificial method of fecundation with regard to the date-palm was practised in early times, according to Herodotus, by the Babylonians, who used to suspend male clusters from wild dates over the females, though they appear to have regarded the small flies found among the wild flowers as the direct cause of the fertility of the females. This process, which was called *palmification*, was also known to the Egyptians, the Phœnicians, and other nations of Asia and Africa.

Dried figs constitute a principal article of sustenance among the lower classes in Greece and the islands of the Archipelago. The quantity imported into Britain in 1853 amounted to 50,428 cwts. The best come from Turkey, Italy, Spain, and Provençe; but the Turkish figs are most esteemed.

2. *Ficus sycamorus*, or Egyptian Sycamore, is a large tree with widely-spreading branches, and produces a delicate eatable fruit, which does not grow upon the tender branches, but in clustered racemes on the trunk and old limbs. It is planted extensively in Egypt on the highways for the sake of the grateful shade it affords. A specimen of this tree, much gnarled and broken, is figured in Salt's *Abyssinia* under the name of *Daroo* tree. Some have supposed that the Egyptian mummy-cases were made of the wood of this tree, which would imply a wonderful degree of durability; but Professor Don is rather of opinion that the timber of *Cordia Myxa* was the material employed for that purpose.

3. *Ficus indica*, the Banyan tree, has been celebrated from antiquity for the peculiar mode of its growth. It has a woody stem, branching to a great height and vast extent, with heart-shaped entire leaves terminating in acute points. Some of these trees are of amazing size and extent, as they

are continually increasing. Every branch from the main body throws out its own roots, at first in small tender fibres, several yards from the ground; but these continually grow thicker until they reach the surface, and then striking in, increase to large trunks, and become parent trees, shooting out new branches from the top, which again in time suspend their roots, and these, swelling into trunks, produce other branches, till at length a single tree forms a little forest. From its long duration, its outstretching arms, and overshadowing beneficence, the Hindus regard the banyan tree as an emblem of the Deity. Near these trees the most esteemed pagodas are generally erected; under their shade the Brahmins spend their lives; and the natives of all castes and tribes are fond of recreating in the cool recesses, beautiful walks, and lovely vistas of this umbrageous canopy, impervious even to the direct rays of a tropical sun. The most celebrated tree of this kind is one on the banks of the Nerbudda, which has been known, in the march of an army, to afford shelter to 7000 men. Much of this remarkable tree has been swept away by high floods, but the remaining portion is said to be near 2000 feet as measured round the principal stems. The name *banyan* is derived from *baniyâ*, *i.e.* a banker—the class among the Hindus with which Europeans formerly had most frequent intercourse. A representation of a banyan tree is given under BOTANY, vol. v., p. 77, fig. 65.

4. *Ficus religiosa*, the pippul tree, is a large tree common to many parts of India, and is regarded with great veneration by the Hindus as having given shelter to Vishnu at his birth. It is often planted near houses for the sake of its umbrageous canopy; and its leaves, which are heart-shaped, long, and pointed, tremble like those of the aspen. They are employed by the Arabs in tanning leather.

5. *Ficus elastica*, which affords a large supply of the caoutchouc of commerce, abounds in Assam, and is plentifully distributed over some other parts of India. The method of obtaining the juice has been described under the head CAOUTCHOUC. It is a fast-growing tree, with large, shining, pointed, thick leaves, and produces a fruit about the size of an olive, but which is not eatable.

FICTION. In a *general sense* a fiction is something feigned or imagined, and in the most extensive acceptation of the word anything which is unreal may be characterized as a fiction. In a *moral sense* a fiction is a culpable falsehood, or rather an imposture, as it always supposes the intention of deceiving. In a *literary sense* fiction assumes a different character. It is employed to produce an illusion, and it is indispensable to its success that it should appear in the guise of truth; nevertheless there is no intention here to make that which is false pass for being true. Works of fiction include novels, tales, romances, and even epic poems. In a *legal sense*, a fiction is something assumed for the purposes of justice though not literally true; thus an heir is held to be the same person as his ancestor in order to make him liable for the debts of him whose estates he has inherited. In a *political sense*, a fiction is that which, though literally untrue, is sanctioned by considerations of expediency for the preservation of order and security. Such is the received axiom in constitutional monarchies, "that the king can do no wrong," the intention of which is to establish the principle that the ministers are responsible for all the acts of the crown. A similar axiom is, that "the king never dies;" that is, it can never be said of the sovereign that he is dead, because on the moment of his decease there lives a sovereign in the person of his successor.

FID, a square bar of wood or iron passed through the hole in the heel or lower part of a topmast, and resting by its ends on the trestle-trees of the mast below; thus serving to support the topmast. Fid also denotes a pin of wood or iron tapered to a point, for opening the strands of a rope in splicing, &c.

FIDDES, RICHARD, a laborious English writer, born at Hunmanby near Scarborough, in 1671. Having received his grammatical education at a private school in the neighbourhood, he was admitted first of Corpus Christi, and then of University College, Oxford; but, after taking the degree of bachelor of arts, in 1693, he returned to his relations, and married the same year a lady of good family and fortune. In 1694 he was ordained priest, and not long afterwards presented to the rectory of Halsham; but was compelled by bad health to remove to Wickham, where he continued for some time. Being thus unable to display his talents as a preacher, he resolved to devote himself to literature, and with this view proceeded to London in 1712, where, by the favour of Swift, he was introduced to the Earl of Oxford, who made him one of his chaplains, and procured for him a similar appointment from the queen. But the change of ministry in 1714 overturned all Fiddes' hopes of preferment, and forced him to apply to writing with greater assiduity than ever. In 1718 he was honoured with the degree of doctor by the university of Oxford. He died in 1725. Dr Fiddes was an ingenious but not very learned man; he possessed a retentive memory, and was capable of the most intense application; his publications were more numerous than interesting; his style as a writer is tedious and prolix, and, though commonly judicious, he almost never rises above mediocrity. His misfortunes, towards the close of his life, were chiefly owing to his connection with that party in the state to which, through Swift, he had been led to attach himself upon his arrival in London. (J. B—E.)

FIDDLE. See MUSIC, and VIOLIN.

FIDE-JUSSOR, in the *Civil Law*, is a surety, or one who obliges himself in the same contract with a principal, for the greater security of the creditor or stipulator.

FIDEI-COMMISSUM, in the *Civil Law*, an estate left in trust with any person, for the use of another.

FIDENÆ (now CASTEL GIUBILEO), in *Ancient Geography*, an old and important Latin city, on the left bank of the Tiber, about five miles from Rome. It is said by Livy to have owed its origin to the Etruscans; but his testimony is not supported by that of any other historian. The idea of its Latin origin is that now generally received. The proximity of Fidenæ to Rome, and its jealousy of the rising power of that state, soon brought the two cities into collision; indeed there is no Latin city which plays so important a part in the annals of regal Rome as Fidenæ, which was not only powerful in its own resources, but by its connection and alliances with other Latin states. Hostilities first broke out between the two cities in the time of Romulus, and continued with little intermission and various success till 496 B.C., when, being abandoned by its allies, it was forced to yield to the Roman arms. In 438 B.C. the Fidenates revolted, slew the Roman ambassadors, and for twelve years maintained an unequal contest with their powerful neighbours. At the end of that time, however, their city was taken and plundered, and the inhabitants sold into slavery. From this time Fidenæ appears no more in history as an independent city. In the later times of the republic and under the empire, Fidenæ continued a small country village, and is mentioned by Horace as almost proverbially lonely and desolate. In the reign of Tiberius it acquired a dismal notoriety from a fearful accident which happened in its neighbourhood. An extraordinary gladiatorial show had attracted vast multitudes of spectators from Rome and the surrounding country, and the temporary wooden amphitheatre in which they were accommodated fell during the exhibition, and destroyed nearly 50,000 persons. No ruins of Fidenæ now exist; but the site of the city has been ascertained beyond a doubt at the modern Castel Giubileo.

FIDES, among the Romans, the personification of faithfulness or fidelity, in whose honour Numa is said to have

erected a temple on the Capitol. No animals were immolated, nor was any blood spilt, in the sacrifices to this deity. Fides was represented as a matron crowned with olive or with laurel, and bearing ears of corn or a basket of fruit in her hand. The ancients also worshipped a god called Fidius, who was supposed to preside over promises and alliances. Fidius was properly a surname of Jupiter, and identical with the Sabine *Sancus* or *Semo*.

FIEF, a term borrowed from the French, and applied to an estate in lands held of a feudal superior. See Fee.

FIELD, John, one of the most celebrated pianoforte-players of his age. He was born in the year 1782, in Dublin, where his father held an appointment as violinist at the Theatre Royal. He learned the principles of pianoforte-playing from his grandfather, who was an organist, but displayed little industry or zeal in the cultivation of his art till the removal of the family to London in 1798, when he was placed under the tuition of Clementi. He became the favourite pupil of this great master, and accompanied him to the Continent in 1802. He made a brillant debut in Paris, enjoyed similar success at Vienna, and thence proceeded with Clementi to Russia, where he spent the greater part of his life. He died at Moscow in 1837. The peculiar characteristic of Field's playing was its extreme delicacy, precision, and gracefulness. The musical compositions of Field, consisting of seven concertos, a quintetto, sonatas, variations, fantasias, &c., display those excellences for which his own performance was distinguished.

FIELD, in *Heraldry*. See Heraldry.

FIELD-MARSHAL, the highest military title in England and some other countries. The term is derived, through the German *feld-marschall*, from the *maréchal de camp* in the old French service. In England the number of field-marshals rarely exceeds five or six; they have no pay and no especial authority as such; but they retain their full pay as generals.

FIELD-OFFICERS, in the army, officers above the rank of captain; as majors and colonels.

FIELDING, Henry, one of the greatest of English novelists, was born at Sharpham-Park, Somersetshire, on the 22d of April 1707. His father, General Edmund Fielding, who had served under John Duke of Marlborough, was the third son of Dr John Fielding, canon of Salisbury, who was the fifth son of George Earl of Desmond, and brother of William the third Earl of Denbigh; and his mother, the general's first wife, was a daughter of Judge Gould. He was also connected with the noble family of Kingston, which, in the celebrated Lady Mary Wortley Montague, boasted a brighter ornament than rank or title could bestow. Henry Fielding was the only son of the first marriage; but he had four sisters of the full blood, one of whom, Sarah, was distinguished as an authoress by the history of *David Simple*, and other literary attempts. General Fielding, after the death of his first wife, married a second time, and had a numerous family of sons, one of whom is still remembered as a judge of police by the title of Sir John Fielding. The expense attending so large a family, together with a natural thoughtlessness of disposition on the part of his father, of whose habits economy formed no part, were probably the occasion of Henry being early involved in those embarrassments with which, excepting at brief intervals, he continued to struggle through life.

After acquiring the rudiments of education under the Rev. Mr Oliver, who is supposed to have furnished him with the outline of Parson Trulliber's character, young Fielding was removed to Eton, where he made great progress in the study of the Greek and Roman authors, and imbibed that deep love of classical literature which may be traced throughout all his works. As his father destined him for the bar, he was, at the age of eighteen, sent from Eton to Leyden, where he remained about two years, and is said to have given the most earnest attention to the study of the civil law. Had he been permitted to continue the pursuit in which he had thus engaged, the courts would probably have gained an accomplished lawyer, and the world would have lost a man of genius; but the circumstances of the father determined the chance in favour of posterity, though against the interests and perhaps the welfare of the son. Remittances, in short, failed, and the young civilian was compelled to return, at the age of twenty, to plunge into the dissipation of London, without a monitor to warn or a friend to support him. His father had indeed promised him an allowance of two hundred pounds a year; but this, as Fielding himself used to observe, any one might pay who would. Possessed of a strong constitution, a lively imagination, and a keen relish of pleasure, with the capacity of enjoying the present and trusting to chance for the future, Fielding thus found himself his own master in a place where the temptations to every expensive indulgence are numerous, and the means of gratification easily attainable; and, with reckless improvidence, he squandered in pursuit of pleasure the scanty means which, with strict economy, might have enabled him to begin the world, at the same time entailing upon himself those distresses and misfortunes in which he was ever afterwards involved.

But as disagreeable impressions never remained long upon his mind, and as it was his disposition to look at the brighter side of things, or rather to enliven the gloomiest prospect with the colours which his own fancy cast upon it, he flattered himself that he would find resources in his own wit and genius, and that the difficulties in which he was involved would be overcome by the exertions which he conceived himself capable of making to surmount them. To a man of pleasure, in fact, some resources were indispensably necessary, and Fielding found them in his pen, having no alternative, as he himself used to say, but to become a hackney writer or a hackney coachman. He at first employed himself in writing for the stage, then in high reputation, from having recently engaged the talents of Wycherley, Congreve, Vanburgh, and Farquhar; his comedies and farces were brought out in hasty succession; between the years 1727 and 1736, play succeeded play, to the number of eighteen, which were struck off as his necessities impelled, and sank oftener than swam in the theatrical sea upon which he cast them. Of these, the only pieces now known or read are the mock-tragedy of *Tom Thumb*, the translated play of *The Miser*, and the farces of *The Mock-Doctor* and *Intriguing Chambermaid;* and yet, as Sir Walter Scott justly observes, they are all the production of an author unrivalled for his conception and illustration of character in the kindred department of imaginary narrative. Whilst Fielding was thus living as a man of wit and pleasure about town, seeking and finding amusement in scenes of gaiety and dissipation, and endeavouring to discharge the expense incidental to such a life by the precarious resources afforded by the stage, which, as may easily be supposed, were inadequate for the purpose, he attempted to improve his circumstances by becoming himself the manager of a company; and having, in 1735, assembled a number of discarded comedians, he proposed that they should perform his own plays, at the little theatre of the Haymarket, under the whimsical title of the Great Mogul's company of comedians. But the project, as might have been expected, did not succeed; and the company, which seemed to have dropped from the clouds, were under the necessity of disbanding. The whole scheme, in fact, has more the air of a mad frolic than of a serious undertaking. During his theatrical career, which, we have just seen, was by no means brilliant, Fielding, like most authors of the time, found it impossible to interest the public sufficiently

Fielding. in the various attempts which he made to gain their favour, without condescending to flatter their political animosities. In two of his dramatic pieces, *Pasquin* and the *Historical Register*, he displays great acrimony against Sir Robert Walpole, whom, in the year 1730, he had in vain attempted to propitiate by some courtly verses. The keenness of the satire made it felt, and its freedom is supposed to have operated considerably in producing a measure which was then thought necessary to restrain the licentiousness of the stage, and to check that proneness to personal and political satire which had been fostered by the success of the *Beggars' Opera*. But this measure, which consisted in vesting a discretionary power in the Lord Chamberlain to refuse a license to any piece which he should disapprove, was very unpopular at the time, and, like all petty legislation, has done mischief which was not intended by it, and failed to accomplish the object for which it was designed.[1]

About the year 1736, Fielding having, it seems, formed the resolution of settling in life, espoused a young lady of Salisbury, named Craddock, possessed of considerable beauty, and of a fortune of L.1500; and, about the same time, he succeeded, in right of his mother, to a small estate of L.200 per annum, situated at Stower in Derbyshire. With this fortune, which, managed with prudence and economy, might have afforded a decent competence, he retired from London to his seat in the country, resolved to bid adieu to the follies and irregularities of a town life, and to cultivate habits of domestic enjoyment. But having unfortunately carried with him the same improvident disposition to enjoy the present at the expense of the future, which marked his whole life, he soon forgot all his resolutions of amendment; established an equipage with showy liveries; threw open his gates to unbounded hospitality; and suffered his whole substance to be devoured by horses, hounds, retinue, and entertainments. Thus, in less than three years, Fielding found himself landless, homeless, penniless, without any other resource than his abilities, and having brought nothing from the country except that experience of rural life and its pleasures which afterwards enabled him to delineate with such inimitable truth and force the character of Squire Western. Not discouraged, however, he entered himself as a student of law at the Temple, and, after the customary term of manducation, was called to the bar. Fielding had now a profession, and, as he had vigorously applied his powerful mind to the study of the law, it might have been expected that his success would have been in proportion to his assiduity. But various causes conspired to obstruct his rise in the legal profession. In the first place, those persons who have it in their power to advance or retard the practice of a young lawyer, seem to have mistrusted the capacity of a man of wit and pleasure for steady application to business; and Fielding's own conduct was in all probability such as to justify this want of confidence in his regularity. In the next place, disease, the consequence of a free life, came to the aid of dissipation of mind, and interrupted the course of his practice by severe attacks of the gout, which gradually undermined his naturally robust constitution. But amidst all this difficulty and suffering, he pursued his researches with great though irregular vigour; and, as a proof of the eminence to which, in happier circumstances, he might have risen at the bar, he left two manuscript volumes in folio on the Crown Law; a branch to which he had most assiduously applied himself. The exigencies of a family, to which he was tenderly attached, forced him however to have recourse again to the stage, where he attempted to produce a continuation of his own piece, *The Virgin Unmasked;* but as one of the characters was supposed to have been written in ridicule of a man of quality, the Lord Chamberlain refused his license. Political pamphlets, fugitive tracts, newspaper essays, and sometimes farces, were the next means he had recourse to for subsistence; and as his ready pen supplied such productions upon every emergency, he contrived out of the scanty profits to support himself and family. But amidst the anxiety and labour of this precarious mode of life, he had the misfortune to lose his wife; a domestic calamity which so deeply affected him that his reason was for a time endangered by the excess of his grief. All violent emotions, however, are happily transient; Fielding recovered from the blow which had stunned him, though his regret was lasting; and the necessity of procuring subsistence compelled him to resume his literary labours. At length, in the year 1741 or 1742, circumstances led him to engage in a species of composition which he rescued from the degraded state in which he found it, and rendered a classical department in English literature.

The novel of *Pamela*, published in 1740, having raised the fame of Richardson to the highest pitch, Fielding, whether tired of hearing it overpraised,[2] or whether, as a writer for subsistence, disposed to catch at whatever interested the public for the time, or whether, finally, seduced by that malicious spirit of wit which delights to turn into ridicule the idol of the day, resolved to caricature the style, the principles, and the personages of this favourite performance. As Gay's desire to satirize Philips produced *The Shepherd's Week*, so Fielding's purpose to ridicule *Pamela* suggested *The History of Joseph Andrews;* but, in both cases, more especially the latter, a work was executed of infinitely greater merit than could have been expected to arise out of such a design; and the reader received a higher gratification than the author himself appears to have proposed or contemplated. In Fielding's novel there is indeed a fine vein of irony, as will appear from comparing it with the pages of *Pamela;* but the production against which the ridicule was directed is now almost forgotten; whilst *Joseph Andrews* continues to be read for its admirable pictures of manners, and, above all, for the inimitable character of Parson Adams, which alone is sufficient to decide the superiority of Fielding over all novel writers. "His learning, his simplicity, his evangelical purity of mind," says Sir Walter Scott, "are so admirably mingled with pedantry, absence of mind, and the habit of athletic and gymnastic exercises, then acquired at the universities by students of all descriptions, that he may be safely termed one of the richest productions of the muse of fiction. Like Don Quixote, Parson Adams is beaten a little too much and too often; but the cudgel lights upon his shoulders, as on those of the honoured knight of La Mancha, without

---

[1] "The regulation," says Sir Walter Scott, "was the cause of much clamour at the time; but licentious satire has since found so many convenient modes of access to the public, that its exclusion from the stage is no longer a matter of interest or regret; nor is it now deemed a violent aggression on liberty that contending political parties cannot be brought into collision within the walls of the theatres, intended, as they are, for places of amusement, not for scenes of party struggle." (*Memoir of Fielding.*) This is no doubt true; but has not the theatre suffered in consequence of the regulation by which all political allusions are excluded from the stage, whilst neither the amount of licentious satire, nor its facilities of gaining access to the public, have been, in the slightest degree, diminished?

[2] This production, many passages of which would now be thought highly indelicate, and condemned as suggestive of licentious ideas, was in those days recommended even from the pulpit. Modern refinement, though it may not have succeeded in banishing immodesty from the heart, has at least had the effect of purifying literary compositions of that grossness which, more or less, deforms almost all those of the last age.

Fielding. the slightest stain to his reputation; and he is bastinadoed without being degraded."[1] *Joseph Andrews* was eminently successful; and poor Richardson, whose greediness of praise was only equalled by his extreme sensitiveness to ridicule, felt proportionally offended; whilst his admirers, male and female, took care to echo back his resentment, and to heap Fielding with reproach. The animosity of the idol and his worshippers, in fact, survived the gifted man who had rendered them all ridiculous; and in Richardson's correspondence we find the most ungenerous, not to say malignant, reproaches cast on his memory.[2] But Fielding does not appear to have retorted any of the ill-will in which Richardson and his coterie indulged. If he gave the first offence without provocation, he was also the first to retreat from the contest, and to leave his exasperated antagonists in undisputed possession of the field. Nor was Fielding slow in conceding to Richardson that praise to which his genius entitled him from the liberality of his contemporaries. In the fifth number of the *Jacobite Journal*, he warmly commends *Clarissa Harlowe*, by far the best and most powerful of Richardson's novels, and which, with those scenes in *Sir Charles Grandison* relating to the history of Clementina, contains the passages of deep pathos on which his fame as a writer must finally rest. "Perhaps this is one of the cases," says Sir Walter Scott, "in which one would rather have sympathized with the thoughtless offender, than with the illiberal and ungenerous mind which so long retained its resentment."

After the publication of *Joseph Andrews*, Fielding had again recourse to the stage, and brought out *The Wedding-Day*, which, though upon the whole unsuccessful, produced him some little profit. This was the last of his theatrical efforts which appeared during his life-time. The comedy of *The Fathers*, in manuscript, was lost by Sir Charles Hanbury Williams, and, when recovered, was performed after the author's death, for the benefit of his family.[3] Besides a variety of fugitive pieces, Fielding published, in 1743, a volume of miscellanies, containing, amongst other things, *The Journey from this World to the next;* a tract of which it is difficult to perceive the scope or aim, although it displays a good deal of Fielding's characteristic humour. His next production was *The History of Jonathan Wild the Great;* a picture of desperate vice, unrelieved by a single indication of human feeling, or even by an accidental deviation into virtue. What object Fielding could have proposed to himself by so revolting a delineation, it is not easy to conjecture. For, besides the disgust produced by the contemplation of wickedness naked and unredeemed, every one must feel, that ascribing a train of fictitious adventures to a real character, has in it something clumsy and inartificial; whilst, on the other hand, it subjects the author to a suspicion of having used as the title of his book the name of an infamous depredator, in the hope of connecting the one with the popular renown of the other. At the same time, there are not many passages in Fielding's works more strongly marked with his peculiar genius, than the scene between Jonathan Wild and the Ordinary, in Newgate. Besides these more permanent proofs of his application to literature, Fielding employed his ready pen in most of the political and literary controversies of the times. He conducted one paper, called *The Jacobite Journal*, the object of which was to eradicate those feelings and sentiments which had already been so effectually crushed on the field of Culloden; and he either entirely composed or had a principal share in *The True Patriot* and *The Champion*, periodicals of the same class. Being attached to the principles of the Revolution, and to the settlement of the succession in the family of Brunswick, he steadily advocated what was then called the Whig cause; but whilst far inferior writers were enriched out of the secret-service money with unexampled prodigality, his zeal and ability remained long unnoticed, and never met with any suitable recompense.

As it was impossible, however, that such a man could be altogether overlooked, Fielding, in 1749, received a small pension, together with an appointment as a justice of peace for Westminster; an office then considered as disreputable, and of which he was at liberty to make the most he could by the worst means he chose. At this period the magistrates of Westminster, being paid by fees for their services to the public, were thence termed trading justices; and in general they appear to have deserved this opprobrious appellation; for the mean and wretched system on which they were remunerated making it their interest to inflame petty disputes, to wring out of thieves and pickpockets a portion of their unhallowed gains, and thus to traffic, as it were, in guilt and misery, seemed equally well calculated to encourage crime, and to degrade those whose ostensible duty it was to repress it. The habits of Fielding, who was never very select in his society, cannot be supposed to have

[1] The style of this piece is said in the preface to be an imitation of Cervantes; but it bears more resemblance to that of the *Roman Comique* of Scarron, from whom Fielding appears to have copied the mock-heroic style, which narrates ludicrous events in the language of the classical epic; a vein of pleasantry, however, which is soon wrought out, and which, if frequently employed, is apt to degenerate into pedantry.

[2] Richardson, being well acquainted with Fielding's sisters, took occasion to complain to them, not of their brother's usage of himself (this would have been natural and honest), but of his unfortunate predilection for what was mean and low in character and description. The following passage is remarkable, first for the unexampled presumption of the writer, who thus constitutes himself the judge paramount of Fielding's qualities; and, secondly, for the malignant indelicacy which could obtrude such observations on the sister of a rival: "Poor Fielding! I could not help telling his sister that I was equally surprised at and concerned for his continued lowness. Had your brother, said I, been born in a stable, or been a runner at a spunging-house, one should have thought him a genius, and wished he had had the advantage of a liberal education, and of being admitted into good company!" The man who could be guilty of such deliberate brutality as is here complacently chronicled, would not have scrupled to employ more criminal means to gratify his animosity, if he had not been restrained either by innate cowardice or a salutary fear of the laws. After this, however, we cannot be surprised to find Richardson alleging that Fielding was destitute of invention and talents; that the run of his best works was nearly over; and that, as an author, he would soon be forgotten!

[3] The following anecdote, which is given by former biographers, shows the carelessness of Fielding respecting his reputation as a dramatist: "On one of the days of its rehearsal (that is, the rehearsal of *The Wedding-Day*), Garrick, who performed a principal part, and who was then a favourite with the public, told Fielding he was apprehensive that the audience would make free with him in a particular passage, and remarked that, as a repulse might disconcert him during the remainder of the night, the passage should be omitted; "No, d—n 'em," replied he; "if the scene is not a good one, let them find *that* out." Accordingly the play was brought out without alteration, and, as had been foreseen, marks of disapprobation appeared. Garrick, alarmed at the hisses he met with, retired into the green-room, where the author was solacing himself with a bottle of champagne. He had by this time drank pretty freely; and, glancing his eye at the actor, while clouds of tobacco issued from his mouth, cried out, "What's the matter, Garrick? what are they hissing now?" "Why, the scene that I begged you to retrench," replied the actor; "I knew it would not do; and they have so frightened me that I shall not be able to collect myself again the whole night." "Oh, d—n 'em," rejoined he, with great coolness, "they *have* found it out, have they?"

been improved by the position into which he was now thrown; and from a humiliating anecdote told by Horace Walpole,[1] in his usual lively but unfeeling manner, it would appear, even after allowance is made for the aristocratical exaggeration of the narrator, that his mind had sunk to the level of his situation. Yet, though the circumstances attending his official situation tended to foster the careless and disreputable habits which he was unfortunately but too prone to indulge, it is consoling to observe that Fielding's principles remained unshaken, and that there is no foundation whatever for the imputation of venality which, from the popular discredit attaching to his office, and his own thoughtless extravagance, the ill-natured world were at one time but too ready to cast upon him. His own account of his conduct respecting the dues of the office on which he depended for subsistence has been confirmed by Mr Murphy, and never doubted or denied. "I will confess," says he, "that my private affairs at the beginning of winter had but a gloomy aspect; for I had not plundered the public, or the poor, of those sums which men, who are always ready to plunder both as much as they can, have been pleased to suspect me of taking; on the contrary, by composing instead of inflaming the quarrels of porters and beggars (which, I blush when I say, hath not been universally practised), and by refusing to take a shilling from a man who most undoubtedly would not have had another left, I had reduced an income of L.500 a year, of the dirtiest money upon earth, to little more than L.300, a considerable portion of which remained with my clerk." Nor was this all. Whilst Fielding thus evinced his disinterestedness as a magistrate, he endeavoured, by various suggestions, to check the growth of crime and depravity. His *Inquiry into the Increase of Thieves and Robbers* contains several valuable hints which succeeding statesmen have adopted, and some which have not yet received the attention they deserve. He was the first to expose the injurious effects of the frequency of pardons, rendered necessary by the reckless multiplication of capital punishments; and he had the merit of directing public attention to that swelling imposthume of the state, pauperism, with the consequences to be apprehended from the state of the poor laws and the mode in which they were administered. He afterwards published a scheme for the provision of the poor, which showed that he was fully sensible of the evil, without being able to suggest an effectual or practical remedy; but although his project for restricting them to their parishes, and providing for them in workhouses, was not approved of, it has never been disputed that his treatise exhibits both the knowledge of the magistrate and the picturesque expression of the novel writer. He also published a *Charge to the Grand Jury of Middlesex*, and some *Tracts concerning Law Trials*, which are considered as valuable.

Before publishing his scheme for the provision of the poor, however, Fielding made himself immortal by the production of *Tom Jones, or the History of a Foundling*; a work composed under all the disadvantages incident to an author alternately harassed by his disagreeable magisterial duties, and pressed by the necessity of hurrying out some ephemeral essay or pamphlet to meet the demands of the passing day.[2] In these painful and precarious circumstances was the first of English novels given to the public, who had not hitherto seen any works founded upon the plan of painting from nature, and who, consequently, were quite unprepared for a work constructed on such a principle. Even Richardson's novels are but a step removed from the domain of the old romance; and, though approaching more nearly to the ordinary course of events, still resemble it by dealing in improbable incidents, exaggerated delineations, and characters swelled out beyond the ordinary proportions of humanity. *Tom Jones*, on the other hand, is truth and human nature itself, and therein consists the incalculable advantage which it possesses over all previous fictions of this particular kind. Fielding is the Hogarth of novelists; and he painted manners with the hand of a master. *The History of a Foundling* was received with unanimous acclamation by the public, and proved so productive to Millar, the publisher, that he handsomely added L.100 to the L.600 for which he had purchased the work from the author.

"The general merits of this popular and delightful work," says Sir Walter Scott, "have been so often dwelt upon, and its imperfections so frequently censured, that we can do little more than hastily run over ground which has been so repeatedly occupied. The felicitous contrivance and happy extrication of the story, where every incident tells upon and advances the catastrophe, while at the same time it illustrates the characters of those interested in its approach, cannot too often be mentioned with the highest approbation. The attention of the reader is never diverted or puzzled by unnecessary digressions, or recalled to the main story by abrupt and startling recurrences; he glides down the narrative like a boat on the surface of some broad navigable stream, which only winds enough to gratify the voyager with the varied beauty of its banks. One exception to this praise, otherwise so well merited, occurs in the story of the Old Man of the Hill; an episode which, in compliance with a custom introduced by Cervantes, and followed by Le Sage, Fielding has thrust

[1] "Rigby gave me a strong picture of nature. He and Peter Bathurst, t'other night, carried a servant of the latter's, who had attempted to shoot him, before Fielding, who, to all his other vocations, has, by the grace of Mr Lyttleton, added that of Middlesex justice. He sent them word he was at supper; they must come next morning. They did not understand that freedom, and ran up, where they found him banquetting with a blind man, a wh—, and three Irishmen, on some cold mutton, and a bone of ham, both in one dish, and the dirtiest cloth. He never stirred or asked them to sit. Rigby, who had seen him come so often to beg a guinea of Sir C. Williams, and Bathurst, at whose father's he had lived for victuals, understood that dignity as little, and pulled themselves chairs, on which he civilized." (*Letters from the Hon. Horace Walpole to George Montague, Esq.* p. 58, London, 1818.) It ought to be added, however, that Walpole, though he has here stigmatized the lowness of Fielding's society and habits, has elsewhere done justice to his talents. In *The Parish Register of Twickenham*, or poetical account of that place, Fielding's residence in the neighbourhood is not forgotten; that residence,

Where Fielding met his bunter muse,
And as they quaff'd the fiery juice,
Droll nature stamp'd each lucky hit
With unimaginable wit.

[2] *Tom Jones* is inscribed to the Hon. Mr, afterwards Lord Lyttleton, in a dedication where he intimates that, without his assistance, and that of the Duke of Bedford, the work would never have been composed, inasmuch as the author had been indebted to them for the means of subsistence whilst engaged in composing it. Ralph Allen, the friend of Pope, is also alluded to as one of his benefactors, but, by his own desire, not named. This modest and munificent patron of merit is said to have made Fielding a present of L.200 at one time, and that before he was personally acquainted with the object of his bounty; an act of rare generosity, and, from the manner in which it was performed, fully confirming the truth of Pope's beautiful couplet:—

Let modest Allen, with ingenuous shame,
Do good by stealth, and blush to find it fame.

into the midst of his narrative, as he had formerly introduced the History of Leonora, equally unnecessarily and inartificially, into that of *Joseph Andrews*. It has also been wondered why Fielding should have chosen to leave the stain of illegitimacy on the birth of his hero; and it has been surmised that he did so in allusion to his own first wife, who was also a natural child. A better reason may be discovered in the story itself; for had Miss Bridget been privately married to the father of Tom Jones, there could have been no adequate motive assigned for keeping his birth secret from a man so reasonable and compassionate as Allworthy.

"But even the high praise due to the construction and arrangement of the story is inferior to that claimed by the truth, force, and spirit of the characters, from Tom Jones himself down to Black George the game-keeper and his family. Amongst these, Squire Western stands alone; imitated from no prototype, and in himself an inimitable picture of ignorance, prejudice, irascibility, and rusticity, united with natural shrewdness, constitutional good humour, and an instinctive affection for his daughter,—all which qualities, good and bad, are grounded upon that basis of thorough selfishness, natural to one bred up from infancy where no one dared to contradict his arguments or to control his conduct. In one incident alone we think Fielding has departed from this admirable sketch. As an English squire, Western ought not to have taken a beating so unresistingly from the friend of Lord Fellamar. We half suspect that the passage is an interpolation. It is inconsistent with the squire's readiness to engage in rustic affrays. We grant a pistol or sword might have appalled him; but Squire Western should have yielded to no one in the use of the English horsewhip; and as, with all his brutalities, we have a sneaking interest in the honest jolly country gentleman, we would willingly hope there is some mistake in this matter.

"The character of Jones, otherwise a model of generosity, openness, manly spirit, mingled with thoughtless dissipation, is, in like manner, unnecessarily degraded by the nature of his intercourse with Lady Bellaston; and this is one of the circumstances which incline us to believe that Fielding's ideas of what was gentleman-like and honourable had sustained some depreciation, in consequence of the unhappy circumstances of his life, and of the society to which they condemned him.

"A more sweeping and general objection was made against the *History of a Foundling* by the admirers of Richardson, and has been often repeated since. It is alleged, that the ultimate moral of *Tom Jones*, which conducts to happiness, and holds up to our sympathy and esteem a youth who gives way to licentious habits, is detrimental to society, and tends to encourage the youthful reader in the practice of those follies to which his natural passions and the usual course of the world but too much direct him. French delicacy, which on so many occasions has strained at a gnat and swallowed a camel, saw this fatal tendency in the work, and by an *arrêt* discharged the circulation of a bungled abridgment by De la Place, entitled a translation. To this charge Fielding himself might probably have replied, that the vices into which Jones suffers himself to fall are made the direct cause of placing him in the distressful situation which he occupies during the greater part of the narrative; whilst his generosity, his charity, and his amiable qualities, become the means of saving him from the consequences of his folly. But we suspect with Dr Johnson, that there is something of cant both in the objection and in the answer to it. 'Men,' says that moralist, 'will not become highwaymen because Macheath is acquitted on the stage;' and we add, they will not become swindlers and thieves because they sympathize with the fortunes of the witty picaroon Gil Blas, or licentious debauchees because they read *Tom Jones*. The professed moral of a piece is usually what the reader is least interested in; it is like the mendicant, who cripples after some splendid and gay procession, and in vain solicits the attention of those who have been gazing upon it. Excluding from consideration those infamous works, which address themselves directly to awakening the grosser passions of our nature, we are inclined to think, the worst evil to be apprehended from the perusal of novels is, that the habit is apt to generate an indisposition to real history and useful literature; and that the best which can be hoped is, that they may sometimes instruct the youthful mind by real pictures of life, and sometimes awaken their better feelings and sympathies by strains of generous sentiment and tales of fictitious wo. Beyond this point they are a mere elegance, a luxury contrived for the amusement of polished life, and the gratification of that half love of literature, which pervades all ranks in an advanced stage of society, and are read much more for amusement than with the least hope of deriving instruction from them. The vices and follies of Tom Jones are those which the world soon teaches to all who enter on the career of life, and to which society is unhappily but too indulgent; nor do we believe, that in any one instance the perusal of Fielding's novel has added one libertine to the large list, who would not have been such had it never crossed the press. And it is with concern we add our sincere belief, that the fine picture of frankness and generosity exhibited in that fictitious character has had as few imitators as the career of his follies. Let it not be supposed that we are indifferent to morality, because we treat with scorn that affectation which, while in common life it connives at the open practice of libertinism, pretends to detest the memory of an author who painted life as it was, with all its shades, and more than all the lights which it occasionally exhibits, to relieve them. For particular passages of the work, the author can only be defended under the custom of his age, which permitted, in certain cases, much stronger language than ours. He has himself said, that there is nothing which can offend the chastest eye in the perusal; and he spoke probably according to the ideas of his time. But in modern estimation, there are several passages at which delicacy may justly take offence; and we can only say, that they may be termed rather jocularly coarse than seductive; and that they are atoned for by the admirable mixture of wit and argument by which, in others, the cause of true religion and virtue is supported and advanced.

"Fielding considered his works as an experiment in British literature; and therefore he chose to prefix a preliminary chapter to each book, explanatory of his own views, and of the rules attached to this mode of composition. Those critical introductions, which rather interrupt the course of the story, and the flow of the interest at the first perusal, are found, on a second or third, the most entertaining chapters of the whole work."

The publication of *Tom Jones* placed Fielding at the head of English novelists, but it seems to have been attended with little or no advantage to his fortune beyond the temporary relief afforded by the copy-money. His last work of importance was *Amelia*, which may be considered as a continuation of *Tom Jones;* but we have not the same sympathy for the ungrateful and dissolute conduct of Booth, as for the youthful, and on that account somewhat excusable, follies of Jones. The character of Amelia is said to have been drawn for Fielding's second wife; and if, as has been alleged, he put her forbearance to tests of the same kind, it must also be confessed that he has in some degree repaid her by the picture which he has drawn

of her purity, delicacy, and tenderness. *Amelia* was published in 1751 by Millar, who paid a thousand pounds for the copyright, and contrived to reimburse himself by an ingenious stratagem which he practised on the trade. In 1752, Fielding, unmoved by former failures, commenced a literary newspaper and review, to be published twice a week, which he entitled the *Covent-Garden Journal;* but although his ready pen, sharp wit, and classical attainments, highly fitted him for conducting a work of this kind, it was his failing to embroil himself in the party squabbles or literary feuds of the day; and on this occasion it was not long ere he involved himself in a quarrel with Dr Hill and other periodical writers, amongst whom we regret to mention Smollett, a man possessed of kindred genius, and second only to Fielding in that department of literature where both so eminently excelled. The warfare was of short duration, and neither party would derive honour from an inquiry into the cause or the conduct of hostilities.

Meanwhile Fielding's strength was fast decaying; a complication of disorders having terminated in a dropsical habit, which totally undermined his naturally robust constitution. But as the Duke of Newcastle, then prime minister, was desirous of receiving assistance from him in the formation of a plan for the prevention of secret robberies, and for improving the police of the metropolis, Fielding undertook, for the small consideration of L.600, to be paid by government, to extirpate several gangs of daring ruffians, who then infested London and its vicinity; and, though his health was thus impaired, he continued to superintend the conduct of his agents, to take evidence, and to make out commitments, until this great object was accomplished. The exertions which were thus rendered necessary, however, proved fatal to his exhausted frame, which was now suffering under dropsy, jaundice, and asthma. The Bath waters were tried, but in vain; and various modes of cure or alleviation were resorted to, though with little effect. As a last resource, therefore, his medical advisers recommended him to try the effect of a milder climate; and with this view he undertook a voyage to Lisbon, of which he has left a record, written with a hand trembling almost in its latest hour.[1] Fielding, however, reached that city alive, and remained there two months; but he was unable to continue his proposed literary labours. The hand of death was upon him; and in the beginning of October 1754 he terminated his earthly career, in the forty-eighth year of his age, leaving behind him a widow and four children. "Thus lived, and thus died," says Sir Walter Scott, "at a period of life when the world might have expected continued delight from his matured powers, the celebrated Henry Fielding, father of the English novel, and in his powers of strong and national humour, and forcible yet national expression of character, unapproached as yet even by his successful followers." (See Murphy's *Life and Genius of Fielding;* Chalmers' *Biog. Dict.*, art. *Fielding;* and, above all, Sir Walter Scott's *Prefatory Memoir*, in Ballantyne's *Novelist's Library.*) (J. B—E.)

FIERI FACIAS, in *Law*, a judicial writ issued on a judgment obtained for debt or damages in the king's courts, by which writ the sheriff is commanded to levy the debt and damages on the goods and chattels of the defendant.

FIESOLE. See FÆSULÆ.

FIFE, a military wind instrument, usually accompanied with the drum. It is sounded by a side-hole, like the German flute, and has a compass of two octaves, from D on fourth line of treble clef, up to D above in altissimo.
